
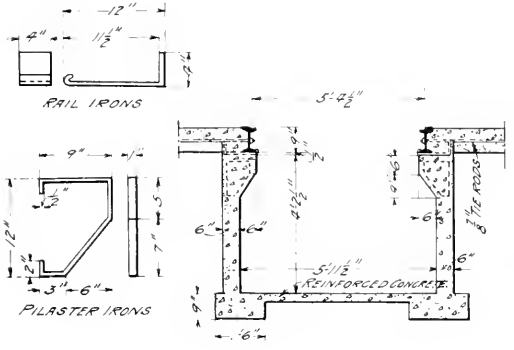
Electric Park Car House—Concrete Support for Tanks on Roof.

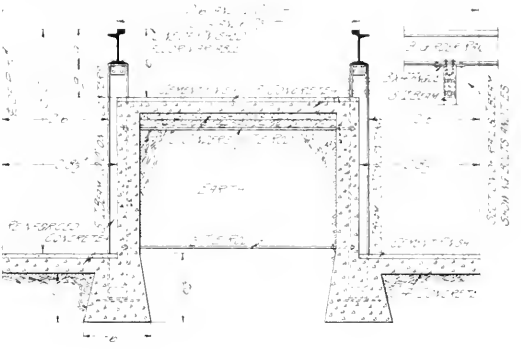
Company of Baltimore, Md. The new car house is located at Electric Park, about 12 miles from the business district of that city, and will serve the cars on several lines operating radially into Baltimore. Accompanying engravings reproduced

from line drawings and photographs show in a very complete way the structure just completed and several of its prominent features. Messrs. Simonson & Pietsch, architects, Baltimore, had charge of the design and erection of the structure under the guidance of H. H. Adams, superintendent of shops.

The new Electric Park car house, as shown in the accompanying ground plan, comprises five bays with a frontage of 213 feet 6 inches. Four of these bays have a length of 294 feet 4 inches; the fifth bay, somewhat shorter in length, is subdivided into rooms to be occupied as follows: Car dis-



Electric Park Car House—Pit Detail.



Electric Park Car House—Pit Detail with Depressed Floor.

patcher, line superintendent, motormen and conductors, toilet, locker, assembly, shop and boiler house. Each of the four long bays has four tracks extending from end to end. The total trackage in the four sections is sufficient to store one hundred and eight 45-foot cars.

The building construction of this car house conforms

stands close to the street line and that by a special arrangement of track work a large proportion of the switches and frogs from the leads to the car house tracks fall under cover. This special arrangement of tracks leaves unoccupied by tracks a triangular portion of the floor space at the front of each bay. These spaces have been used for storage purposes. At the front of one bay is a special fireproof room in which are taps for the oil supply. The oil for immediate use is not kept in the building, but is stored in a 120-gallon tank buried outside of the building line in front of the oilroom just mentioned. A steel-concrete stairway leads to a small storeroom above the oilroom. The triangular space at the front of the second bay is divided into two rooms, in one of which sand is stored; the other is set apart for the use of the car cleaners. A stairway over the sandroom affords convenient access to the roof of the car house. In the third bay

Electric Park Car House—View of Exterior.

closely to that recently adopted as standard by the United Railways & Electric Company. The foundations, floors and roof structures are all of concrete, reinforced where necessary. The side, end and curtain walls in this car house are of brick. A considerable amount of cut stone has been used for decorating the front of the building. Seven skylights built in the concrete roof serve to illuminate each bay. The monitors supporting these skylights are built of concrete slabs, the glass being held in a copper-covered framework. The window openings in the side walls have sheet metal sashes.

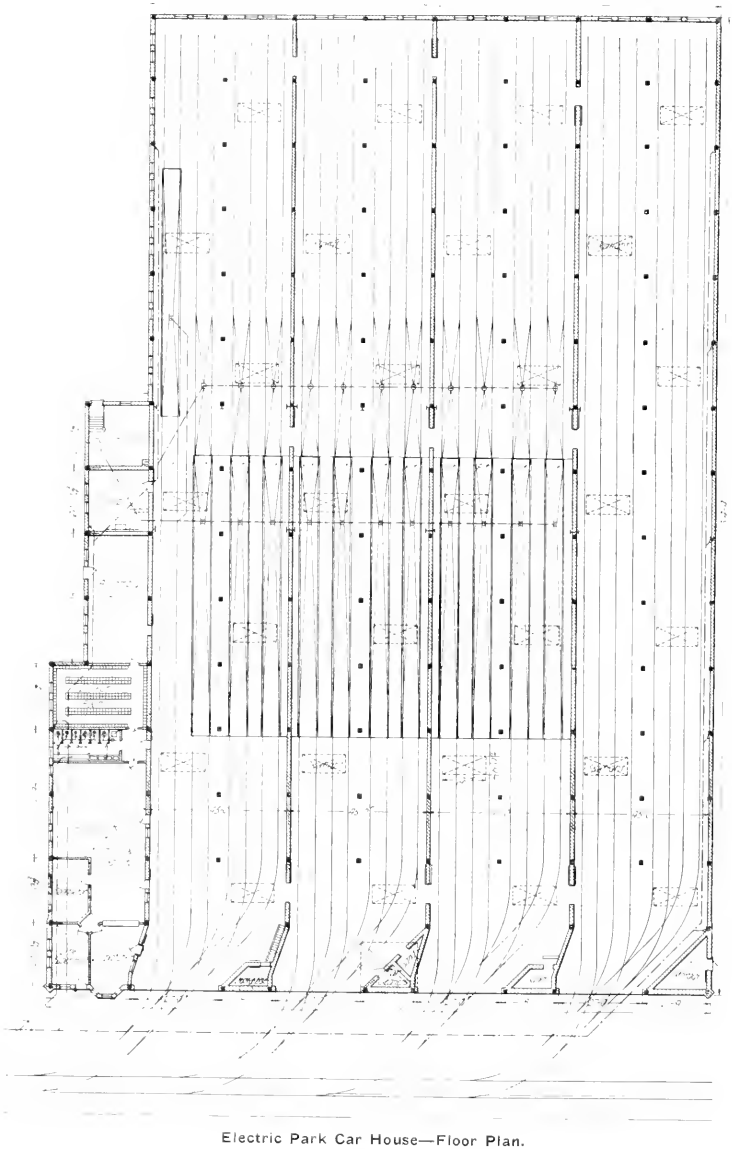
It will be noted from the ground plan that the car house

a similar space is utilized entirely for sand storage, and in the fourth bay the triangular floor space not occupied by the tracks is set off from the interior of the car house by a fireproof wall through which there is no opening. This room forms a very convenient place for oil storage. It may be entered only from the exterior of the building through a special fireproof door.

To provide an emergency water supply a large tank has been mounted on a reinforced concrete tower above the roof of the two middle bays. One of the accompanying engravings shows this tower with the tank upon it. The upper floor of

the tower is of sufficient area to accommodate another tank of a size equal to that already installed. Leading from the tank are pipes connecting with hose outlets placed systematically about the building.

Three of the bays are provided with inspection pits built according to the detail drawings presented herewith. It will be noted from the illustrations that the floor between the pits is depressed and that the rails are carried on structural steel posts. This detail of construction affords more room and better light for car inspection and the making of light repairs. Each pit has installed in it radiating coils connecting with the steam piping of a system that heats the entire structure. The pits and also the washing floor at the rear of the pits are provided with drainage traps leading to sumps which are emptied by a motor-driven centrifugal pump mounted on the floor of the small shop adjacent to the inspection bay.



Electric Park Car House—Floor Plan.

A CORRECTION.

In the issue of the Electric Railway Review of February 8, page 179, we published what purported to be the names of certain standing committees of the recently organized American Street and Interurban Railway Traffic and Transportation Association. This publication was entirely premature and unintentional so far as the authorities of the association were concerned. Certain names were given to the editor in confidence as a draft of the committees, and the memoranda covering that draft were by inadvertence construed as "copy" in the office during the absence of the editor. We desire in this public manner to give expression of our regret at this occurrence and to state that the fault was entirely our own and that neither Secretary Swenson of the American association nor any of the officers of the new association were in any way guilty of the discourtesy of this publication prior to the notification of the individuals of their appointment. We sincerely regret the occurrence and trust that the parties concerned, as well as our readers, will accept our apologies.

High-Tension Direct-Current Railway in Switzerland.

An electric railway connecting the city of Bellinzona, Switzerland, with Mesocco is interesting, since the electrical supply is at 1,500 volts direct current. The power station for supplying the railway is at Cebbia, just above Mesocco, on the Moesa river, where there is a fall of nearly 1,000 feet. The length of the road is nearly 20 miles. The grades are heavy and 50-ton trains are hauled over the line at a speed of 12½ miles an hour. A dam across the river forms a reservoir from which a pipe line runs to the power station, where there are two 1,000-horsepower turbines, each coupled to a three-phase generator on one side and a direct-current generator on the other. The three-phase generators are rated at 420 kilowatts, 10,000 volts, 50 cycles. The direct-current generators are rated at 275 kilowatts, 1,600 volts. Direct current is supplied direct to the trolley wire at Mesocco, while the high-tension alternating current is transmitted to a substation, where it is transformed, by means of motor generators, to direct current at 1,500 volts. There are two of these sets, each with an output of 400 horsepower. The motor cars are about 45 feet long, each equipped with four motors, one on each axle.—Railway and Engineering Review.

MEETING OF INDIANA RAILROAD COMMISSION AND OPERATING OFFICIALS OF ELECTRIC RAILWAYS.

A notable conference was held between the Indiana railroad commission and representatives of electric railways on Tuesday of this week at the Indiana state house, Indianapolis. The meeting was called by the following circular:

It being the duty of the railroad commission "to keep informed as to the condition of railroads and railways, and the manner in which they are operated with reference to the security and accommodation of the public," an inquiry and investigation is hereby instituted as to the rules for operating and dispatching cars, and as to the qualifications of motormen and conductors, on the traction lines of this state.

The managers, superintendents and dispatchers of said railroads are, therefore, requested and directed to appear before the commission for conference and information upon these subjects, and for the purpose of formulating and adopting uniform operating rules and practices, and for providing for the instruction of conductors and motormen in their rules and duties, and to take such other steps for safe operation and the prevention of accidents as may be agreed on or ordered.

In response to the invitation of the commission a large number of operating officials of electric railways were present when the meeting was called to order at 10 a. m. by Union B. Hunt, chairman of the commission.

Representatives of Commission and Companies.

Representing the commission there were present, besides Mr. Hunt, the other members of the commission, C. V. McAdams and W. J. Wood; also Alexander Shane, chief inspector; D. E. Matthews, inspector; Charles B. Riley, the secretary; and L. E. Morton, the clerk. Among the representatives of electric railways present were the following:

Indiana Union Traction Company—H. A. Nicholl, general manager; C. A. Baldwin, superintendent of transportation; C. S. Keever, division superintendent at Muncie; M. W. Surratt, superintendent Tipton division; C. W. Dragoo, dispatcher Tipton division; J. B. Buris, dispatcher, Anderson; A. G. Snell, chief clerk to superintendent of transportation.

Ft. Wayne & Wabash Valley Traction Company—C. D. Emmons, general manager; R. T. Gunn, superintendent of transportation; F. I. Hardy, superintendent interurban division.

Angola Railway & Power Company—S. A. Wood, vice-president.

Chicago South Bend & Northern Indiana Railway—Charles G. Lohman, superintendent; W. T. Durbin, director; R. R. Hayes, chief dispatcher.

Ohio Electric Railway—A. Benham, assistant district manager.

Evansville & Mt. Vernon Electric Railway and Evansville & Eastern Electric Railway—C. H. Batlin, general manager.

Evansville & Southern Indiana Traction Company—F. M. Durbin, general manager.

Evansville Suburban & Newburg Railway—Gus Mulhausen, general manager.

Indianapolis & Cincinnati Traction Company—Charles L. Henry, receiver; George S. Henry, traffic manager; G. D. Nicoll, mechanical and electrical engineer; Oscar Lively, trainmaster; D. A. O'Mara, chief dispatcher.

Indianapolis Crawfordsville & Western Traction Company—A. H. Stockton, acting general manager; J. E. Hoffman, train dispatcher.

Kokomo Marion & Western Traction Company—H. P. Martsolf, superintendent of transportation.

Marion Bluffton & Eastern Traction Company—C. W. Clark, superintendent.

Terre Haute Indianapolis & Eastern Traction Company—C. C. Reynolds, general manager; G. K. Jeffries, superintendent eastern division; C. L. Demeree, chief dispatcher eastern division; R. W. Reynolds, superintendent northwestern division; C. E. Morgan, superintendent Brazil, Danville and Martinsville division; M. B. Goodykoontz, chief dispatcher Brazil, Danville and Martinsville division; F. B. Byrd, chief dispatcher Brazil division.

Toledo & Chicago Interurban Railway—A. J. Purinton, manager; G. M. Patterson, general freight and passenger agent.

Winona Interurban Railway—H. S. Dickey, general superintendent; C. O. Sullivan, assistant superintendent.

Indianapolis Columbus & Southern Traction Company and Indianapolis & Louisville Traction Company—A. A. Anderson, general manager. Indianapolis & Louisville Traction Company—R. J. Thompson, assistant secretary and treasurer. D. C. Ward, trainmaster; Ed Ray, dispatcher. Indianapolis Columbus & Southern Traction Company—W. A. Carson, assistant general manager; L. Brown and C. Wells, dispatchers.

Louisville & Northern Railway & Lighting Company and Louisville & Southern Indiana Traction Company—F. E. Cole, general superintendent.

Lake Shore Electric Railway—L. K. Burge, superintendent.

Muncie & Portland Traction Company—C. M. Witt, chief dispatcher.

Address of Chairman Hunt.

In further explanation of the purpose of the meeting Chairman Hunt made a brief statement, an abstract of which follows:

From reports made by our inspectors, resulting from inspections made and information gathered in other ways, there seems to be quite a variety of methods and systems in practice on the various electric lines in this state in regard to rules governing the movement of trains and for the control of employes in various departments; in other words, there appears to be a deplorable lack of uniformity. With the hope that these conditions might be improved the commission issued the circular calling this meeting.

It is not necessary to make a detailed statement of the various methods in vogue because the gentlemen here assembled are probably more conversant with these conditions than either the commission or its inspectors. On some roads the rules and practices are so lax as to make opportunities for errors that might result disastrously.

While traction lines are in their infancy, yet, with the experience that the officials have had in railroad operation, they should be able to formulate a much better system; the commission cannot formulate the system for you. It will not attempt to do so, but suggests that you call to this work your best talent and best thought and give to it such careful attention as will ultimately bring about the desired results. Conventions have been called in other states and rules have been formulated and compiled. We have before us a copy of the rules adopted by the Central Electric Railway Association at Columbus, O., on September 6, 1907, which has been furnished by a line in this state which is now operating under these rules; and, as far as we have been able to determine, they are the most satisfactory now in use. They are, however, far from complete, and our inspectors call attention to many places where they think the rules can be improved.

Rule No. 152 says: "Train orders must be addressed to those who are to execute them, naming the place and," etc. We call attention to the fact that this rule specifically says that they must name the place, while the forms adopted for the train orders give everything in numbers, leaving room for doubt and opportunities for mistakes.

Rule No. 144 provides "that all trains must approach meeting points"; and it occurs to us that it would be better should this rule read "passing points." A more complete examination of these rules will probably develop many other improvements that might be made.

In addition to the defects mentioned this code of rules includes nothing in regard to the maintenance of way department, which should be fully protected.

The work of formulating rules will, much of it, necessarily have to be performed by committees to be appointed in a manner to be determined by you.

In the discussion of all these matters, such as rules, car orders, qualification of motormen and conductors, and all other matters that may come up for consideration, I hope all the members of this conference will feel perfectly free to express themselves, for it is only by full expressions, both from the railroad officials and the commission, that a proper and satisfactory understanding can be arrived at.

William J. Wood, member of the commission, spoke of the feeling that a great many of the accidents which take place might easily have been prevented and said he believed that the meeting could take such action in the adoption of uniform rules as would anticipate remedial legislation that might go too far. He thought that no similar meeting had ever been held between representatives of electric railways and a state railroad commission, and he believed its work could be made of great benefit to the roads and to the state. Mr. Wood added that he drafted in 1889 the first charter for an interurban road in the state, the Evansville Suburban & Newburg Railway, and that he was its first manager. He added that this road, which was represented at the meeting by Gus Mulhausen, the general manager, had never killed or injured a passenger. Of the two who had been killed, not passengers,

one was a trespasser on the property of the company. This company operates partly by electricity and in part by steam.

Work of the Inspectors.

Chairman Hunt then called upon Mr. Shane, the chief inspector of the commission, to address the meeting. Mr. Shane was formerly superintendent of roadway and track of the Toledo St. Louis & Western Railroad and has been connected with steam railways since 1867. He has as his assistants D. E. Matthews and C. A. Preble, who were formerly in the transportation department of the Pennsylvania Railroad. Mr. Shane investigates matters relating to the physical property and to operation. Mr. Matthews investigates all accidents and assists in inquiries into methods of operation. Mr. Preble inspects the equipment. The assistance of Prof. E. O. Gorman of Purdue University and of various engineers is sometimes secured by the commission.

In addressing the meeting Mr. Shane said that the majority of railroad men were developed at the expense of the railroads, and that as the companies had paid for the experience which fitted their men to fill positions of responsibility, the railroads should profit by it. He said that some roads had no rules and others showed great improvement in their methods of operation. He emphasized the fact that railways could not be held responsible for accidents which took place because people trespassed on railway property. His experience had demonstrated that 90 per cent of the accidents were due to carelessness and lack of efficiency, rather than to any deficiency in equipment. Considering the traffic and age of the electric roads they were in very good condition, but a great many details needed attention and were receiving it from the more progressive companies. Mr. Shane declared that the official who placed in effect rules for the government of employes and did not see that they were carried out set an example that destroyed discipline and demoralized the organization. He recognized that it was very difficult to establish discipline, because the greatest penalty a railway could inflict is discharge or suspension of employes. He said that a law should be passed providing a penalty for employes of electric railways who neglect to observe rules, and that the companies should be able to call upon the state to assist in the enforcement of rules.

Roads Must Take Initiative.

W. T. Durbin, former governor of Indiana and director of the Chicago South Bend & Northern Indiana Railway, said that the people are taking more notice of accidents than ever before and that if the railways do not take the initiative the general assembly of the state will act. He declared that passengers have a right to feel that the companies have a system of discipline that in large measure will prevent accidents.

Mr. Shane was asked to enumerate some of the defects he had noticed. He spoke of the omission of warning signs at crossings and said that many switches had no lights. He mentioned also the lack of signals and the existence of improperly located and displayed signals, but said that there was no place where he could take exceptions to the condition of the track. He suggested that rules for trainmen and maintenance of way employes be divided into two books.

The following committee was then appointed to frame, during the noon recess, a definite programme: C. D. Emmons, Ft. Wayne & Wabash Valley Traction Company, chairman; H. A. Nicholl, Indiana Union Traction Company; Fletcher M. Durbin, Evansville & Southern Indiana Traction Company; Charles G. Lohman, Chicago South Bend & Northern Indiana Railway; S. A. Wood, Angola Railway & Power Company. Mr. Shane and Mr. Matthews, representing the commission, were to meet with the committee.

Report of the Committee.

At the afternoon session the committee made the following report:

It is the sense of your committee that the good work of the railroad commission and its inspectors be indorsed by this conference, and in furtherance of the objects and in order to aid them further in their work for the betterment of the operation and maintenance of the interurban roads of this state, we recommend the appointment of two committees consisting of five members each, to be appointed by the chairman of the railroad commission from among the representatives of the various traction companies, Mr. Shane and Mr. Matthews to serve on both committees in addition to the five members named by the chairman; one committee to investigate and report on operating train rules, using as a basis for such rules the standard code of rules adopted by the Central Electric Railway Association at Columbus, O., on September 19, 1907, and the other committee on maintenance of way, including roadway and overhead construction, these reports to be made at a future conference to be called by the chairman of the commission.

In accordance with the report of the committee Chairman Hunt appointed two committees to continue the work, as follows, Mr. Shane and Mr. Matthews acting as the representatives of the commission on both committees:

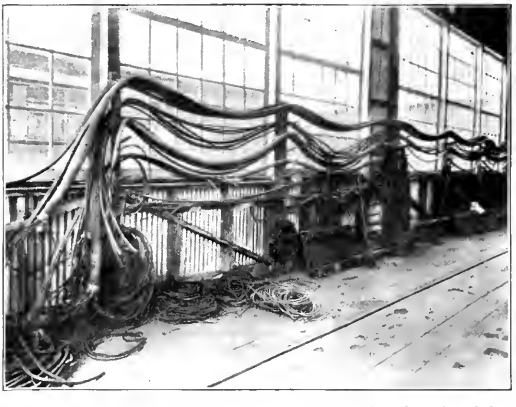
Committee on "Maintenance of Way Rules"—A. A. Anderson, Indianapolis & Louisville Traction Company; T. B. McMath, Terre Haute Indianapolis & Eastern Traction Company; J. J. Brennen, Ft. Wayne & Wabash Valley Traction Company; J. W. Moore, Indianapolis & Cincinnati Traction Company; W. C. Sparks, Indiana Union Traction Company.

Committee on "Rules for Trainmen"—C. D. Emmons, Ft. Wayne & Wabash Valley Traction Company; H. A. Nicholl, Indiana Union Traction Company; Charles G. Lohman, Chicago South Bend & Northern Indiana Railway; C. C. Reynolds, Terre Haute Indianapolis & Eastern Traction Company; F. M. Durbin, Evansville & Southern Indiana Traction Company.

The chairmen of the committees will call meetings as soon as possible. After rules are framed copies will be mailed to all the companies interested in order that the rules may be considered carefully before the next conference is called. Before adjournment Mr. Hunt thanked the officials of the electric railways for their presence and interest in the conference.

CAR WIRING CABLES IN STOCK.

To facilitate the quick repairing of the wiring under the cars of the Oakland Traction Company, George St. Pierre, master mechanic, keeps on hand a stock of cables with wires drawn in, as shown in the accompanying illustration. During odd times these cables are made up with the proper number of wires so arranged that in the event of a burnout on an operating car its main wiring may be quickly torn out and at once replaced by a complete group of wires inclosed in a waterproof hose.



Oakland Traction Company—Method of Storing Supply of Car Wiring Cables Ready for Immediate Use.

A bill has been introduced in the New Jersey legislature to require that the third-rail on electric roads be protected throughout its entire length.

MOVEMENT TO INCREASE FARES IN MASSACHUSETTS.

The Electric Railway Review has received letters from officials of various electric railways in Massachusetts which include detailed information concerning the movement to increase urban and interurban fares in that state. The communications follow:

Worcester Consolidated Street Railway.

E. G. Connette, general manager Worcester Consolidated Street Railway, Worcester, Mass., writes as follows: "Our rate is five cents within the city limits with universal transfer and on our suburban lines we have 5-cent zone limits, which are determined by the number of towns through which the lines operate. I consider the method of establishing fare zones on suburban lines unequal and inconsistent. In some instances the zone covers a mile in distance, while in others it covers six miles, depending to a large extent upon the town lines; and in a number of cases the revenue per car-mile scarcely pays operating expenses. The only uniform method for fares on suburban lines is to establish the fares on a mileage basis. The prices of material and labor used in the operation and maintenance of electric lines have been constantly increasing with a constant public clamor for reduction of fares and extension of fare limits. The tributary population on a large number of the suburban lines is insufficient to sustain the operation and the maintenance with present conditions without regard to a fair return for the capital invested in the property, and an advance in the rate of fares or the shortening up of the fare limits will become absolutely necessary to perpetuate the existence of these lines. We have some poor suburban territory, but have no definite plan for changing the rates at the present time."

Blue Hill Street Railway.

Stone & Webster of Boston write as follows concerning the increase in fare made by the Blue Hill Street Railway, Canton, Mass., of which they are general managers: "The rate of fare was advanced from five to six cents on January 5 of the current year. It is too early to be sure what the final result of this increase will be, but, so far, it has increased the gross earnings over the corresponding period last year by 8 or 10 per cent, while we would normally expect some decrease on account of local conditions. We believe there are other small roads in Massachusetts which are contemplating a similar increase of fares, and have no doubt but that it will be tried in many instances."

Milford & Uxbridge Street Railway.

W. L. Adams, superintendent Milford & Uxbridge Street Railway, Milford, Mass.: "Our rates are from one to two cents a mile. While we do not think that the rates are as much as they should be in some places, we do not contemplate changing them at present."

Boston Elevated Railway.

C. S. Sergeant, vice-president Boston Elevated Railway: "Our rate is limited by our charter to five cents, so that there is no question with us of increase or diminution of rate."

Boston & Northern Street Railway.

P. F. Sullivan, Boston & Northern Street Railway, Boston: "Our fares are usually five cents, with transfer privilege in each city and each town. The interurban rates are about 1 cent to 1¼ cents per mile." Mr. Sullivan spoke on "Street Railway Conditions with Reference to Rates of Fare in Massachusetts" at the dinner of the Massachusetts Street Railway Association at Boston on February 12, and said in part: "In the matter of changing rates of fare to meet changed conditions it seems to me that in the case of the smaller companies, they must either increase the unit of fare or surrender their charters and remove their tracks, for the longer they continue business the greater will be their indebtedness and the less valuable will be the material to be sold. If they increase the unit of fare the amount must be determined in each case. In the case of the larger and older companies, if they maintain the present unit of fare in the larger cities they will be compelled to reduce transfer privileges and increase the unit of fare on the rural lines, not to a rate based upon distance, but to a rate based upon conditions in the particular locality. It is neither justice nor good business that companies honestly capitalized and honestly managed should not have a fair return on the capital invested under the Massachusetts laws and subject to their control and regulations. If they cannot improve present conditions, if they cannot get a better return than they do at present, then they cannot obtain capital for future improvements, or the companies will be forced to remove the tracks from non-paying lines."

Concord Maynard & Hudson Street Railway

John W. Ogden, superintendent Concord Maynard & Hudson Street Railway, Maynard, Mass.: "There is no doubt that suburban roads, in the east at any rate, must raise their fares or give up business. There is no reason why the investors in these enterprises should not receive an adequate return on their investments, as in any other business. The people, in my mind, are becoming of the same opinion, but they need more education on the subject, and I think more newspaper work ought to be done in educating them. The continual increases in prices of all materials that enter into the construction and operation of railways, together with the continued legislation against street railways, make it absolutely impossible for the investors to get a fair return for their investment at present rates of fare. The people are continually demanding additional privileges and favors from the companies. Educate the people to stop trying to make laws to burden the roads to such an extent that they will be obliged finally to pull up their tracks. Our rate of fare is five cents. We regard it as inadequate; the haul is too long. Rates should be at least 1.5 to 1.75 cents per mile on the average. We have not yet changed our fares, but we shall do so about March 1; the details are not yet settled."

CENTRAL ELECTRIC RAILWAY ASSOCIATION STANDING COMMITTEES.

President F. D. Carpenter of the Central Electric Railway Association has just announced the following standing committees for the year 1908:

Subjects.

H. A. Nicholl, chairman, general manager Indiana Union Traction Company, Anderson, Ind.

E. C. Spring, general superintendent Dayton Covington & Piqua Traction Company, West Milton, O.

F. W. Coen, vice-president Lake Shore Electric Railway, Norwalk, O.

J. C. Rothery, general manager East Liverpool Traction & Light Company, East Liverpool, O.

A. A. Anderson, general manager Indianapolis Columbus & Southern Traction Company, Columbus, Ind.

Insurance.

H. N. Staats, chairman, vice-president American Railway Insurance Company, Cleveland, O.

H. J. Davies, secretary Cleveland Electric Railway, Cleveland, O.

H. P. Clegg, president Dayton & Troy Electric Railway, Dayton, O.

Finance.

C. N. Wilcoxon, chairman, general manager Cleveland Southwestern & Columbus Railway, Cleveland, O.

George Whysall, general manager Columbus Delaware & Marion Railway, Marion, O.

W. G. Irwin, vice-president Indianapolis Columbus & Southern Traction Company, Columbus, Ind.

F. D. Norviel, general passenger and freight agent Indiana Union Traction Company, Anderson, Ind.

H. E. Vordermark, auditor Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.

Standardization.

R. C. Taylor, chairman, superintendent motive power Indiana Union Traction Company, Anderson, Ind.

W. S. Townsend, master mechanic East Liverpool Traction & Light Company, East Liverpool, O.

F. Heckler, superintendent motive power and cars Lake Shore Electric Railway, Fremont, O.

M. Baxter, master mechanic Western Ohio Railway, Lima, O.

W. A. Gibbs, division manager Ohio Electric Railway, Newark, O.

L. Clark, master mechanic Indianapolis Traction & Terminal Company, Indianapolis, Ind.

Publicity.

George Davis, chairman, associate editor Electric Traction Weekly, Cleveland, O.

R. Hitt, associate editor Street Railway Journal, Chicago, Ill.

E. B. Grimes, Ohmer Fare Register Company, Dayton, O.

L. E. Gould, editor Electric Railway Review, Chicago, Ill.

Transportation.

F. J. J. Sloat, chairman, division manager Ohio Electric Railway, Dayton, O.

F. T. Hepburn, district manager Lima & Toledo Traction Company, Lima, O.

Irwin Fullerton, auditor Detroit United Railway, Detroit, Mich.

Charles G. Lohman, superintendent Chicago South Bend & Northern Indiana Railway, South Bend, Ind.

J. W. Brown, superintendent transportation West Penn Railways, Connellsville, Pa.

Vigilance.

A. A. Anderson, chairman, general manager Indianapolis Columbus & Southern Traction Company, Columbus, Ind.

C. D. Emmons, general manager Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.

T. J. Ferneding, vice-president Dayton & Xenia Transit Company, Dayton, O.

F. A. Davis, president and general manager Scioto Valley Traction Company, Columbus, O.

G. W. Parker, general express agent Detroit United Railway, Detroit, Mich.

F. J. Green, vice-president and general manager Springfield Troy & Piqua Railway, Springfield, O.

Supply.

J. F. Ohmer, chairman, Ohmer Fare Register Company, Dayton, O.

S. D. Hutchins, Westinghouse Traction Brake Company, Columbus, O.

L. J. Drake, Jr., Galena-Signal Oil Company, Indianapolis, Ind.

W. H. Bloss, Ohio Brass Company, Indianapolis, Ind.

F. H. Strieby, General Electric Company, Cincinnati, O.

PRACTICAL REPAIR SHOP KINKS.

BY H. P. CLARKE, NEW YORK CITY RAILWAY.

Modern methods and up-to-date appliances yield handsome returns in the electrical shop of today. Considerable thought has been expended along these lines in the electrical shops of the New York City Railway Company. In designing shop tools and appliances two important factors must be kept in view. They must be handy and light. Anything cumbersome will soon be cast aside and primitive methods resorted to.

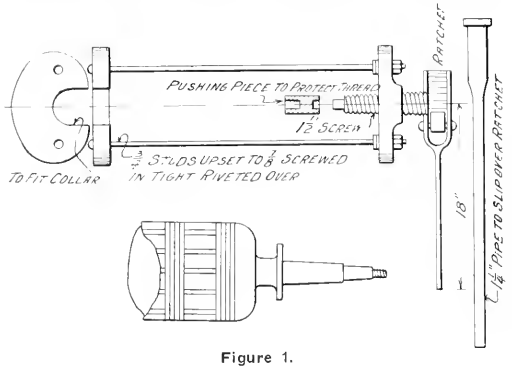


Figure 1.

The removal of thrust collars from armature shafts, loosening and tightening commutators, removing and tightening the clamping ring from G.E.-1,000 armatures, etc., are all simple operations in themselves, yet difficult and costly without suitable appliances.

The device illustrated herewith for removing collars from G.E.-1,000 armatures is very simple. A horseshoe flange with two studs and a ratchet at the business end will do the work in a "jiffy." The removal of collars from Westinghouse armatures is not so simple, especially if the coils are in the armature, the space between the collar and coils being so small that considerable difficulty will be experienced in designing a rig that will exert a force of 15 tons and not injure the coils. This has been accomplished with a rig as shown in Figure 2. For this purpose a pattern was carefully worked out and cast in steel, forming a split ring to clamp over the collar with two ¾-inch bolts, using a ratchet for working the screw. With this rig collars can be taken off without trouble. It will do the work on either end of the armature by simply using a longer pushing piece.

For commutator work, back heads on G.E.-1,000 armatures, etc., ratchets are used also; the armature in all cases is rotated and the nut held fast. For G.E.-1,000 armatures a wrench is used as shown in Figure 4. This device readily adjusts itself to any variation in the pin holes and a light wooden post with a slot through the upper end takes the strain exerted by the ratchet applied to the taper end of the armature shaft. This ratchet is made from an old pinion with the tops of the teeth turned off, and reduced to about half length, the small end of the pinion being used. The teeth are about two inches long.

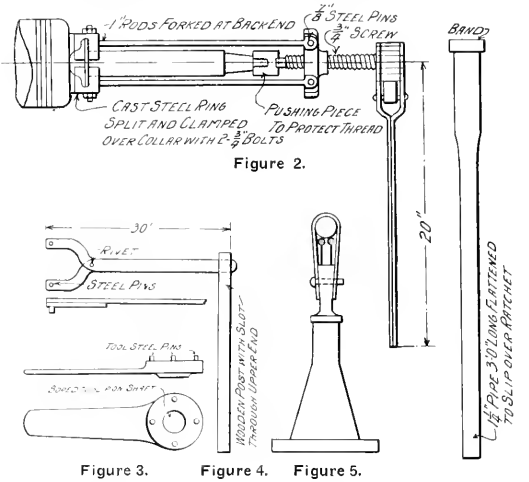

Figure 2.

Figure 3. Figure 4. Figure 5.

For commutator work similar devices are employed, except that they are much heavier. A wrench for handling screw rings is shown in Figure 3. With this rig commutators can be loosened or tightened without trouble and loose commutators become a thing of the past. For commutator work the stand is secured to the floor, a stirrup is dropped over the shaft and the pin slipped in as shown. By this means all danger of throwing the armature out of the stand is avoided.

Secretary Travis H. Whitney of the New York public service commission of the first district has given out the report of accidents upon railroads within its jurisdiction during the month of January, 1908. The total number of accidents was 3,921, and the total number of persons killed 44, against 3,993 accidents and 51 killed in December. Detailed figures for January follow:

Car collisions	170
Persons and vehicles struck by cars	934
Boarding	479
Alighting	416
Contact with electricity	34
Other accidents	1,888
Total	3,921

The accidents are classified as follows:

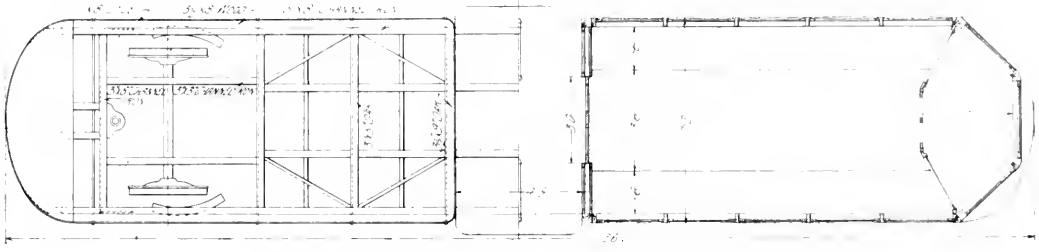
Passengers	1,444
Persons not passengers	570
Employes	486

PAY-AS-YOU-ENTER CARS FOR MEXICO.

The Toronto Railway Company is building in its shops at Toronto 20 pay-as-you-enter cars for the Monterey Railway Light & Power Company of Monterey, Nuevo Leon, Mexico.

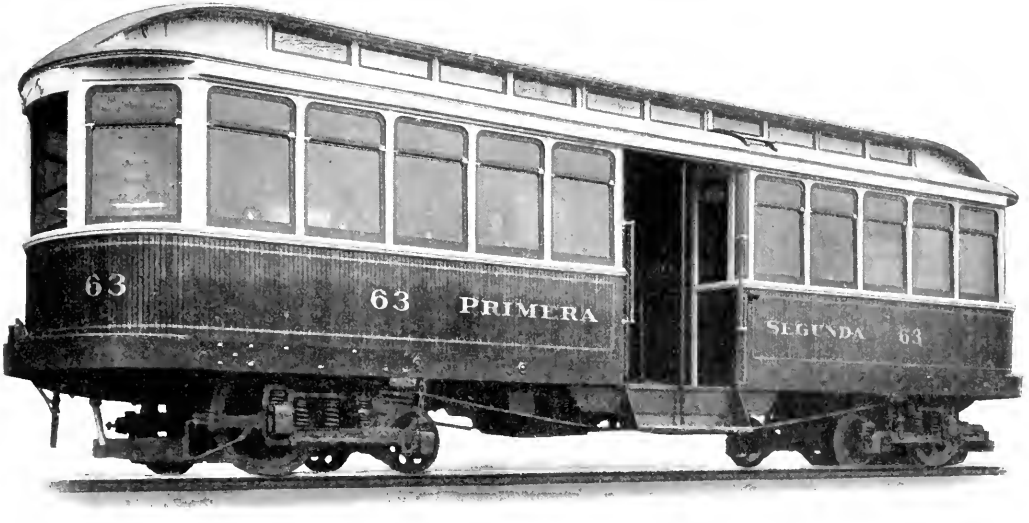
The cars are of special interest in that they are of the double-center entrance type, that is, having central side entrances on both sides of car, which feature in connection with the length of car required special construction of the underframing throughout.

In appearance the completed car resembles two cars connected together under a single roof, each car being of the closed type and separated one from the other by the centrally located platform or vestibule.



Pay-As-You-Enter Cars for Monterey, Mex.—Floor Plan and Framing.

This design of "Jim Crow" car is common in Mexico, where it is the custom for the "peons" and second-class passengers to occupy only the rear car or compartment. The first-class passengers ride separately in the forward compartment, which is also occupied by the motorman, the car being "single-ended."



Pay-As-You-Enter Cars for Monterey, Mex.—Exterior View, Showing Center Side Entrance.

The car is 36 feet in length, 7 feet 1 inch in width over side sheathing and 12 feet 6 inches in height. It will be noted that the car is unusually narrow, which is accounted for by the narrow streets of the Mexican city, the track gauge being standard.

Upon reference to the accompanying drawing it will be seen that the principal feature of the special underframing referred to consists of the two outer side sills. These sills are formed of heavy channel beams running the entire length of the car and are offset vertically at the entrances to receive the platform flooring and provide for easy access for the passengers. The sills are reinforced between corner posts of each car by heavy oak fillers, to which are secured the end and cross sills, side posts, flooring, etc.

The end sills—four in number—are of heavy oak. To the outer end sills is attached a channel beam of the same height as the side sill beams. This channel, having its ends flanged and bent at right angles, is securely bolted to the side channels and serves the additional and unique purpose of receiving the king bolt of the maximum traction trucks. The inner end sills are reinforced by heavy corner angle plates secured to the side channels. The center longitudinal sills are also formed of channels, but of small dimensions, and laid horizontally with flanges up to receive the floor fillers. Cross sills are of wood and are trussed with rods inserted in grooves in the sill and extend through the side sills, being bolted on the outside.

The circular bulkheads are protected with $\frac{1}{2}$ by 6 inch steel bands. These bands extend back along the side of the car a considerable distance, being securely fastened to the outside of the side channel and forming a base for the side sheathing.

The ends of the car are also circular in shape and present a very neat and attractive appearance, especially in the car

interior, the deck being of the monitor type. This feature also provides a greater capacity for the car. The seats of both compartments are of rattan and run longitudinally, the seats in the rear compartment being continuous around the circular end.

The motorman is neatly partitioned off in the forward compartment, the partition being of substantial oak framing, in which are inserted drop sashes to provide for ventilation and light. The partition is also provided with a centrally located door having a glass panel.

The forward compartment is finished in antique oak rubbed down to an egg shell gloss. The rear compartment is finished in white ash. The general finish of the car exterior is of cherry in the vertical side sheathing.

As the climate of Mexico is extremely warm the car is designed after the semi-convertible plan; the upper or transom sashes raise into the roof, while the lower sashes drop into side pockets, the opening of which is covered with neatly finished arm rests.

An interesting feature of the car is the vestibule, located between the compartments and used in connection with the pay-as-you-enter system of fare collection. The collection box, which is about a foot square and similar to the "chop boxes" in use at the New York elevated and subway stations, is located in the center of the platform and is permanently attached thereto. As entrance to the car is made on either side or both an upright hand railing divides the platform laterally. A space of about 2½ feet is allowed between the end supports of the hand railings and the box on both sides for passengers and conductor. The purpose of the railings is to separate the passengers for their respective compartments. Each compartment is provided with wide sliding double doors. As the conductor's duties require him to remain at all times on the platform, the car is equipped with trolley retrievers. Cars are fitted with signal lights in front, designating routes by the color system.

The cars are for city use entirely and were designed by M. Power, master car builder of the Toronto Railway Company.

CHANGES IN FARES IN MASSACHUSETTS.

(FROM THE SPRINGFIELD (MASS.) DAILY REPUBLICAN.)

The Springfield Street Railway Company is not the only one among the strongly located trolley concerns which is leaning toward heroic remedies. On both of the great aggregations of lines running north and south of Boston, the fare limits are being cut down, while the Blue Hill Street Railway, running from Boston to Canton and Stoughton, has increased its unit of fare from five to six cents. On the Newton system free transfer privileges were cut down some time ago. Very possibly the service on these and other lines is being contracted also; but the feature of retrenchment measures on the roads around Boston seems to be an increase of charges through reduction of fare limits and transfer privileges, while with the local street railway company it is a reduction of service, none too adequate before, on which the public has come to depend.

Either method of strengthening the financial position of the companies will arouse public protest, but it may be questioned whether the course of least resistance will not be found along the line of free transfer privileges, in which most of our street railway companies have acted very generously. It is further to be admitted that some of the single-fare stages are very long and might in extreme cases be reasonably reduced. Something is to be said on behalf of the American practice of charging one fare without much regard for distance. Its distributive effect upon a city's population in the matter of residence is great and healthful. But the English method of grading fares by broad distance zones is juster, since the cost of transportation varies roughly according to distance. From the general financial position of the electric railway companies in this state, it is apparent that a tendency is likely to develop toward the English plan of a closer grading of fares according to distance. But in doing this the companies will have to act considerately of those vested residence interests which have grown up on the basis of present charges, and they will also be asked to remember that five cents is not necessarily to be regarded as a minimum charge.

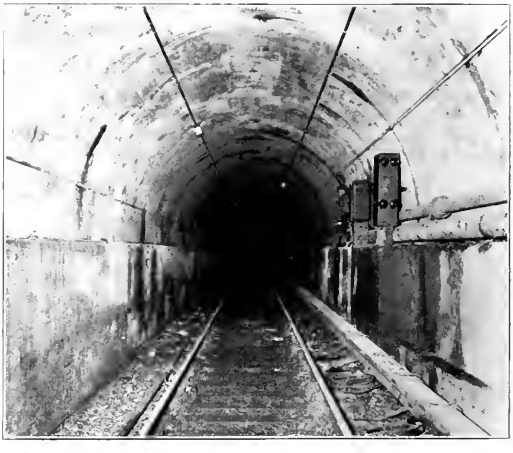
THE HUDSON RIVER TUNNEL SYSTEM.

The first of the Hudson & Manhattan Railroad Company's tunnels under the Hudson river will be opened to the public on February 25. The part of the route now to be opened consists of a twin tube tunnel extending from Hoboken, N. J., to Sixth avenue and Nineteenth street, New York, a distance of nearly three miles.

Passenger stations in Manhattan will be located as follows: Christopher and Greenwich streets, where connection will be made with the Ninth avenue elevated line; Christopher street and Sixth avenue, where connection will be made with the Sixth avenue elevated; and in Sixth avenue, at Fourteenth, Nineteenth, Twenty-third, Twenty-eighth and Thirty-third streets. At the Hoboken terminal direct connection is made with the Delaware Lackawanna & Western Railroad.

Eight-car trains, electrically propelled, will be run continuously through the tunnel and the time between Hoboken and Nineteenth street, New York, will be about 10 minutes.

The cars are made entirely of steel, absolutely fireproof and differ materially from any others now used in the metropolitan district. They have large sliding side doors in the middle, as well as at either end, and the platforms at the terminal stations are so arranged that passengers enter and leave the cars at the same time from opposite sides.



Hudson River Tunnel—First Signal Station.

The doors of the cars are operated by compressed air and no signal bells are used. When the last door in the train is securely closed the motorman receives an electric flash signal and starts the train. The cars have only side seats and are equipped with steel rods set vertically at frequent intervals to aid passengers to steady themselves when the trains are crowded. These cars were fully described in the Electric Railway Review of June 15, 1907, page 782.

Throughout the system, which comprises 18 miles of under-river and underground railroad, the stations are designed with a view to comfort, permanency and beauty. They are made large enough to provide for growth of traffic in the future. All parts of the stations are constructed either of concrete or metal, so that there is no possibility of fire.

The tunnels will be well ventilated, as each train acts as a piston, forcing the air ahead of it and drawing in a fresh supply from the surface as it proceeds.

The tunnels in the Hoboken-Manhattan section, as in all parts of the system, are made of steel rings, coated with concrete, bolted together and set in place as the boring shield, working in compressed air, opened the way for them. The in-

terior diameter of the tubes is 15 feet 3 inches. The depth of the tunnels below the surface of the Hudson river varies from 60 to 90 feet. The depth of earth and rock between the roof of the tunnel and the water ranges from 15 to 40 feet. The two tubes are entirely separate and are about 30 feet apart for the greater part of the distance under the river.

A complete description of the New York tunnel system while under construction was published in the Electric Railway Review of November, 1906, page 893. The system of the Hudson & Manhattan Railroad may be described by dividing it into four sections, all of which are connected and also brought into direct connection with other principal transportation lines on both sides of the river. The first section is the part about to be opened and generally known as the north tunnels. The second section, or south tunnels, nearly completed, extends from Cortlandt and Fulton streets, New York, to Jersey City, where a large terminal station has been built in the solid rock directly beneath the present structure of the Pennsylvania Railroad station. The third section is a transverse tunnel running along the New Jersey shore of the Hudson, 1¼ miles, connecting the terminal in Jersey City with that in Hoboken. This section taps all of the trunk and local transportation lines on the Jersey shore between the two points and serves as an important feeder to the under-river tubes. The principal point in this line is at the Erie terminal. The fourth section is a branch line running from Jersey City to Newark. This extends underground through the populous district of Jersey City and then comes to the surface and continues over the tracks of the Pennsylvania road to Newark. Another spur of the underground system, now being constructed in Manhattan, runs from Sixth avenue, east under Ninth street, and will connect with the Interborough Rapid Transit Company's subway near Astor place.

Within a radius of 15 miles from the city hall in New York there are 1,800,000 persons who will be directly benefited by the under-river railroads. The regular single fare through the tunnels will be five cents.

Terminal Structure.

Perhaps the most interesting and important point in the tunnel system is the 22-story structure located at Church and Cortlandt streets, known as the Hudson Terminal buildings, which occupies the larger part of two city blocks. From the train platforms, two stories below the street level, one may proceed by underground and under-river routes to any part of Greater New York. The tunnels come in under the structure about 30 feet below the street level, forming a loop with platforms and approaches of sufficient dimensions to accommodate 1,000 persons a minute. The building has 52 elevators and is fireproof.

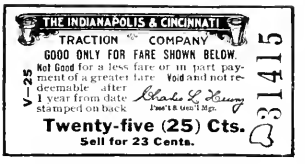
The men who have been conspicuous in carrying out the work are: Walter G. Oakman, president of the construction company, known as the Hudson Companies; William G. McAdoo, president of the Hudson & Manhattan Railroad Company; and Pliny Fisk and William M. Barnum of the banking house of Harvey Fisk & Sons. The engineering features were worked out by Charles M. Jacobs, chief engineer, and J. Vipond Davies, deputy chief engineer. During a part of the time since the work began as many as 6,500 men have been employed at one time. The cost of the system when fully completed will be about $70,000,000. The entire system is expected to be in operation during the coming summer.

The value of a developed water power is stated by Charles T. Main, mill engineer and architect, of Boston, to be as follows: "If the power can be run cheaper than steam, the value is that of the power, plus the cost of plant, less depreciation. If it cannot be run as cheaply as steam, considering its cost, etc., the value of the power itself is nothing, but the value of the plant is such a sum as could be paid for it new, which would bring the total cost of running down to the cost of steam power, less depreciation. That is, it is worth just what can be gotten out of the plant and no more."

CHANGES IN TICKET SYSTEM OF INDIANAPOLIS & CINCINNATI TRACTION COMPANY.

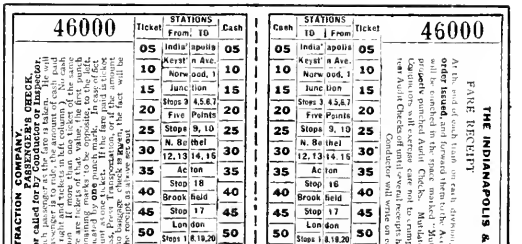
The Indianapolis & Cincinnati Traction Company, Indianapolis, has made some changes in its ticket system for an account of which we are indebted to George S. Henry the traffic manager.

On January 29 the conductors of this company began to issue fare receipts to all passengers, either for ticket or cash payments. A formal notice concerning the change, posted for the information of passengers, stated: "This company reserves the right to collect fare to destination from any passenger not holding a receipt properly punched. Examine receipts. Keep receipts unless called for by an authorized inspector or by the conductor. Claims for overcharge and the like will not be entertained unless claimant presents a proper receipt or memorandum of its number in case it has been surrendered to the company."



Changes in Indianapolis & Cincinnati Tickets—Form of Ticket.

The fare receipt, as illustrated herewith, is in two parts. These parts, folded, are issued to conductors in book form. One punch suffices for the part which is given to the passenger



Changes in Indianapolis & Cincinnati Tickets—Fare Receipt.

and the part retained by the conductor for his report. Additional notice to passengers regarding the receipts is in the cars in the form of a poster stating that "the conductor is required to give each passenger one receipt. Examine and keep receipts unless called for by the conductor or an inspector."

The use of this form of fare receipt follows the introduction of tickets by Mr. Henry in July last, which are sold at a discount. These tickets are issued in denominations of five cents and multiples. More than one ticket may be used to make up a total required for transportation, but if a ticket representing a large amount is tendered for a ride, no change will be given. For instance, three 10-cent tickets will be

accepted for a fare of 30 cents, but if a 30-cent ticket is tendered for a 10-cent ride the balance will not be refunded by the company. Prior to the introduction of this form of ticket the cash fares collected by conductors on one division amounted to 44 per cent of the total fares, and on the other division the percentage was 38. A steady decline in these figures took place from July to December. By the latter month but 26 per cent of all the fares represented cash payments to conductors. With the new system of fare receipts the percentage is becoming still lower.

In discussing the advantages of these changes Mr. Henry said: "They make it possible to secure an absolute check on the traffic."

PROGRAMME FOR ANNUAL MEETING OF IOWA ASSOCIATION.

Announcement is made by L. D. Mathes, secretary and treasurer Iowa Street and Interurban Railway Association, that the 1908 convention will be held at the Savery hotel, Des Moines, Ia., on April 23 and 24. The following papers will be read:

"Re-enforced Concrete in Electric Railway Construction," by N. M. Starke of Des Moines, Ia.

"Depreciation," by L. D. Mathes, manager Union Electric Company, Dubuque, Ia.

"Claims—Methods of Handling Same by Electric Railways," by Arthur W. Gross, general claim agent Omaha & Council Bluffs Street Railway, Omaha, Neb.

"Handling Fares on Interurban Railways," by P. P. Crafts, general manager Iowa & Illinois Railway Company, Clinton, Ia., and Pittsburg Railways Company, Pittsburg, Kan.

There will be a general discussion on the subject, "Advertising by Electric Railways." This subject has not been especially assigned to any individual but a number of members will be prepared to discuss it.

Mr. Mathes states that ample space will be provided for manufacturers who desire to make exhibits, and that for the use of this space there will be no charge. The association, in conjunction with the Iowa Electrical Association, has rented the ballroom of the hotel, which will provide ample accommodations for exhibitors. Allotment of exhibition space may be secured by application to W. G. Owen, general superintendent Des Moines City Railway, Des Moines, Ia.

The entertainment feature will be taken care of by the officials of the Des Moines City Railway, the Inter-Urban Railway and the Des Moines Edison Light Company.

Trussed Roofs.

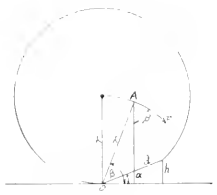
Bulletin No. 16 of the engineering experiment station of the University of Illinois has just appeared. It briefly presents the results of several years' study of trussed roofs by N. Clifford Ricker, professor of architecture. About 50 trusses of a selected type and of different proportions and arrangement were designed in long-leaf pine and steel and changed until the assumed and actual weights of the trusses agreed. Other trusses were likewise designed in white pine and steel and a few constructed entirely of steel. To perform this work as conveniently and as rapidly and accurately as possible it became necessary to devise simplified formulas and tables, with a systematic method of treatment, all of which are fully explained in the pamphlet. The results illustrated are mostly shown in graphic tables for ready appreciation. The most important features are a new formula for the weights of trusses; per cent of weight to be added for connections; most economical ratio of depth to span of truss; distance between trusses; number of purlins per panel; and dimensions of panels. It was found that white pine and steel trusses are about 10 per cent lighter than those of long-leaf pine and steel; also that, if carefully designed, steel trusses from 100 to 200 feet span have about the same weight as those of white pine and steel. It is believed that this bulletin will be valuable and suggestive to all persons interested in the design and construction of trussed roofs. Copies may be obtained gratis upon application to the director, engineering experiment station, Urbana, Ill.

ALLOWABLE LENGTH OF FLAT SPOTS ON CAR AND LOCOMOTIVE WHEELS.*

BY E. L. HANCOCK, PURDUE UNIVERSITY.

In the absence of experimental data as to the impact to which rails are subjected because of flat spots on car and locomotive wheels, the author has made a theoretical analysis. The development of a formula for the energy with which a flat wheel strikes the rail is as follows:

Let the diagram represent the wheel, of radius, r, having a flat of length, d. Represent the velocity of the train by v. At any instant it may be considered that the kinetic energy of the wheel, with its weight, considered as rotating about the point, O, is the same as if the mass supported by the wheel be regarded as concentrated at its center, that is, its kinetic energy is $\frac{1}{2} Mv^2$, where M is the combined mass of the car and wheel and v is the velocity of train. When the flat spot is in contact with the track the center of the wheel is at the point A, distant below the original position approximately $\frac{1}{4}$ h,



which is equal to $d^2 \div 4\,D$, where d is the length of the flat spot and D is the diameter of the wheel. At the point A the mass has a downward velocity equal to v cos β.

But cos β equals $d \div D$, so that the kinetic energy with which M strikes the rail is $\frac{1}{2} Mv^2 \cos^2 \beta = \frac{Mv^2 d^2}{2 D^2}$, where v is the velocity of train in feet per second, d the length of flat spot in feet and D the diameter of the wheel in feet.

It is assumed that the permissible kinetic energy of the blow caused by the flat spot should not exceed the kinetic energy with which the tup strikes a rail in the prescribed drop test. Hence the energy of the impact as deduced is equated to 380,000 foot-pounds, the energy of a 2,000-pound weight falling through 19 feet.

The weight upon a car wheel being assumed to be 10,000 pounds and the diameter of the wheel 33 inches, the formula becomes $d = \frac{29.4}{v}$ ..... (A)

While the energy of impact will be slightly increased by reason of the action of gravity increasing the velocity of the mass during the fall through the distance of A below the center, approximately $\frac{h}{4}$, it is found that this is so small as not appreciably to affect the results.

A formula corresponding to (A) for a 72-inch driving wheel, assuming a load of 25,000 pounds on the driver, is

$d = \frac{40.6}{v}$ ..... (B)

The following table shows the values of d for various speeds:

Length of Flat Spot Permissible, d.

Speed v, in m. p. h.—	33-inch wheel—Formula A. d in ft.	Factor of safety of 10, d in in.	72-inch wheel—Formula B. d in ft.	Factor of safety of 10, d in in.

*Abstract of paper presented before the Indiana Engineering Society, January 17, 1908.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

No Liability for Injuries from Ordinary and Usual Movements of Cars.

Howard v. Louisville Railway Company, 105 Southwestern Reporter, 932.—The court of appeals of Kentucky says that it is not able to agree with counsel that an instruction was open to objection which stated that if the plaintiff, after she boarded the car in safety, fell against a seat by reason of the ordinary and usual movements of the car in starting, they should find for the defendant. Ordinary and usual movements of the car in starting might have caused the plaintiff to lose her balance and fall, but, if so, the company would clearly not be liable. They are only negligent and responsible for injuries when the car starts in an unusual or violent manner, and not in the ordinary way.

Ordinance Restricting Speed Applies to Territory Added to Municipality.

Deneen v. Houghton County Street Railway Company, 113 Northwestern Reporter, 1126.—The supreme court of Michigan says that a village ordinance was passed when the defendant company was granted a franchise to build its road upon certain streets in the village of Hancock, which contained the provision: "Said cars shall after sunset be provided with proper signal lights, shall be properly heated in cold weather, and shall be run at a rate of speed not exceeding eight miles an hour within the limits of said village." The place where the plaintiff was injured was not within the village at the time the grant was made, and the defendant acquired its right to construct and operate its road at that point from other sources. It was contended that the ordinance did not become operative as to that locality by the subsequent extension of the village limits; in other words, it was the contention that the defendant might lawfully operate its road in compliance with its vested right, acquired from the outlying township, subject to the obligation of complying with such police regulation as should be made by the village after acquiring jurisdiction of this territory. But the court is of the opinion that this provision of the ordinance was intended for the protection of the citizens, and that it was in the nature of a police regulation, although it might also have aided in establishing contractual relations, and that actions for personal injuries due to its breach, and alleged as such (as in this case), might be brought by the injured person. Manifestly, then, the ordinance in question, restricting the defendant's right to run its cars faster than eight miles an hour, was admissible in evidence in this case. It is the general rule that a general ordinance applies to all territory within the corporate limits at the time of its passage, and becomes effective in additional territory when such is attached.

Liability from Ownership of Car Regardless of Control of Railway.

Chaffe and Another v. Consolidated Railway Company, 82 Northeastern Reporter, 497.—The supreme judicial court of Massachusetts says it was urged in this personal injury case that, notwithstanding an admission that at the time of the accident the plaintiffs "were passengers upon a car of the defendant," there was no evidence as to who was operating the car, or in control of the railway. But if the details were meager it was beyond conjecture that the defendant, described in the writ as a railway company, owned a car running over a line of street railway, operated by electricity, in which the plaintiffs in common with others were being transported. It received and undertook to carry the plaintiffs in this car over the line of track on which it ran, and the use to which the car was put, with the conditions of operation unexplained, warranted the inference that the defendant at the time offered this means of transportation to those who wished to avail themselves of such facilities.

If the plaintiffs were passengers, in a car provided by the defendant, it had engaged to exercise such reasonable diligence for their safety during transportation as the nature of the business required.

Another car variously described as a work or flat car preceded the car in which the plaintiffs were riding, when, as it approached a portion of the track in which there was a rising grade, the forward car, being then a short distance in advance, slid on the rails and suddenly descending came into collision with the passenger car, causing the accident. It was said that there was a failure of evidence to connect the defendant with the management of the work car. But the plaintiffs having shown the collision, this fact until explained by the company was some evidence of negligence, as the jury could find that in the ordinary course of affairs it would not have happened if proper precautions had been taken. If negligence was found, then the defendant was responsible to the plaintiffs for the resulting injury to which it voluntarily had exposed them, even if the work car and the railway were under the control of another corporation.

Liability for Injury in Alighting of Person Boarding Car "Not in Service."

Ahern v. Minneapolis Street Railway Company, 113 Northwestern Reporter, 1019.—The supreme court of Minnesota says that the evidence in this case tended to show, among other things, that at about dusk the plaintiff was waiting for an easterly bound car, when one approached, slowed down as it neared the crossing, and when it was about 15 feet east thereof it came to a stop and the motorman opened the gates to take on passengers. The plaintiff got on the car, and, as her testimony tended to show, when she was in the door of the car the conductor called to her, "This car takes no passengers," and repeated it, from which she understood that he intended that she should get off, which she started to do, but when she was on the bottom step of the car, in the act of stepping to the ground, the car started forward, the gates began to close, and she was thrown to the ground.

The conductor and motorman each testified that on the trip they discovered that the air brake of the car was broken, and the sign "Not in Service" was turned up and was plainly visible at the time the car reached the crossing. The plaintiff testified that she did not see the sign, and there was no evidence that she did, except the fact that it was displayed. In this connection the defendant urged that it was error for the court to sustain the plaintiff's objection to the defendant's offer to show by the motorman that: "He did it [opened the gates] wholly involuntarily, simply as a matter of habit, without in any way intending to invite any one as a passenger upon his disabled car." But the ruling was correct, for the intention of the motorman and his supposed involuntary act, of which the plaintiff was not advised, could not affect her rights.

The supreme court also holds that the correct statement of the law applicable to this case was contained in instructions which told the jury what would constitute the plaintiff a passenger on the car, and to the effect that if, in what the motorman and conductor did and failed to do in stopping the car and opening the gates, she had reason to believe that the car at that time was intended to carry passengers, and, so believing, she in good faith boarded the car, she was, for the purposes of this case, a passenger on the car, and continued to be until she was given a reasonable time and opportunity to leave it in safety; and, further, if she saw the sign "Not in Service" on the car, still, in view of all the evidence, it was a question for the jury whether or not she had good reason to believe and did believe in good faith that the car carried passengers.

News of the Week

Progress of the Cleveland Negotiations.

Mayor Johnson of Cleveland and F. H. Goff, representing the Cleveland Electric Railway, on February 17 decided on a method of determining the valuation of the Cleveland Electric Railway's unexpired city franchises. It was decided to settle on an average length of life of the franchises and to compute the value for the entire city system on the basis of car-mile earnings. Harry Bunning, chief engineer of the Forest City Railway, has computed the average life of the franchises as 3.26 years, using the car-mile earnings in 1906 to determine the relative importance of the lines. Henry J. Davies, secretary of the Cleveland Electric Railway, estimates the average life at 4.4 years. It was also agreed that a division should be made between the city and suburban lines on the basis of the average length of haul.

It has been decided to issue a call for stockholders' meetings of both companies as soon as possible, in order that they may be ready to pass upon the results of the negotiations when concluded.

Proposal to Divert Chicago's Traction Profit.

It has been suggested that the money received by the city of Chicago from the street railways be diverted for current needs of the city. The water department is in urgent need of funds and the aldermen who favor using the payments of the traction companies to meet the requirements of this department argue that the money could be advanced as a loan.

Walter L. Fisher, special traction counsel for the city, expressed himself as follows on the subject:

"I think it would be an inexcusable mistake to use this money for anything else than traction purposes. We need it for the subways. It was intended when the ordinances were passed that the share from their net receipts due the city should be used for street railway purposes. This plan should be rigidly adhered to, as to pursue any other course would simply mean a breach of faith with the people. If the money is used in building the subways the ultimate cost of the street railway properties to the city—provided the latter takes them over—would be so much the less, as the subways are bound to come."

Indiana Union Traction Company Declines to Arbitrate Strike.

The Indiana Union Traction Company has declined to arbitrate its differences with the Amalgamated Association of Street and Electric Railway Employes, who declared a strike on January 1 because the company signed a contract with a rival organization, the Brotherhood of Interurban Trainmen. On February 14 a committee representing the strikers called on President A. W. Brady of the company and asked for a settlement of the strike by arbitration. They also submitted a petition to this effect, signed by 1,800 business men. Mr. Brady's reply, declining the proposition, was sent to each person who had signed the petition, with a statement that the company had signed a contract with the Brotherhood and consequently could make no new contract. Mr. Brady's letter reads in part as follows:

"No question of wages, hours, working conditions or unadjusted grievances was involved. Of the total number of motormen and conductors in the service of the company previous to January 1, 1908, only about one-third were dissatisfied with the course followed by the company, the other two-thirds having remained and still remaining at their work. In the interurban service but 10 per cent of the motormen and conductors left their work; that is, only about 20 out of a total of over 200.

"The company was compelled to employ new men to take the places of the men who voluntarily left their work on or about January 1, and all cars have been regularly operated for a number of weeks past. The company cannot in fairness to these new men adopt any course which would lead to their discharge in order to find places for the men who walked out, and who since have endeavored to harass and obstruct the company in many ways, including the illegal attempt to establish a boycott. At the same time, the company will, as openings arise, treat with any old employes seeking re-employment without discrimination because of their having participated in the mistake of the strike."

Legislation Affecting Electric Railways.

District of Columbia.—A bill has been drafted by Corporation Counsel Thomas of Washington which gives the commissioners of the District of Columbia the powers of a public service commission with jurisdiction over railroads, traction companies, electric light, heat and power companies and telephone companies. The commission is given power to regulate the rates, service and stock and bond issues, to have access to all books and records and to investigate accidents, order improvements in property or service, etc. Such companies are required to make annual reports to the commission and may be required to publish all rates and schedules. Provision is made that every public service corporation shall maintain such facilities as required by the commissioners, who may fix prices, rates and charges, in the absence of any specific law. Every public service corporation may be required to publish all service schedules, rates and tariffs. No public service corporation shall, according to the bill, increase its capital stock or issue bonds without first obtaining the approval of the commission, which shall keep informed as to the general conditions, capitalization and franchises of the corporations. In addition to the reports now required by law, annual reports shall be made by the corporations of such matters as may be required by the commission. The commission is empowered to issue or revoke permits or licenses, and to make or alter rules or regulations it may reasonably see fit.

New York.—An organization of the allied real estate interests of New York has had introduced in the legislature an amendment to the rapid transit law which permits the public service commission to ask for bids for the operation of subways, built by the city, the term of the lease to be limited to 35 years, with right of renewal for 25 years; or for the construction and operation of a subway under a 25-year franchise, the city to have the right to revoke the franchise at any time on payment of the cost of construction.

Ohio.—The Howe bill, providing for a state commission to value the property of public service corporations for taxation, which was recently defeated by the senate, has been reintroduced in a new form, which does not apply to electric railways or telephone companies. Mr. Howe has introduced another bill which gives city councils the right to fix, by franchise ordinance, the rates of street and interurban railways.—The Stockwell bill, which proposed to give city councils authority to regrant street railway franchises upon their expiration to new companies without the necessity of securing property owners' consents, was defeated in the house on February 13.

Rapid Transit Affairs in New York.

Henry B. Seaman, chief engineer of the New York public service commission, has submitted a report on the Brooklyn bridge conditions in which he says that the new improvements at the Manhattan terminal, which were described in the Electric Railway Review of February 1, 1908, page 154, are a failure and recommends a restoration of the 6-car shuttle service, which he says would give a greater seating capacity than the through elevated cars. Mr. Seaman recommends that all cars used for the bridge service should have side doors, that the elevated trains should be increased to 8 or 10 cars, that the transfer station at Sands street should be enlarged, and that the Brooklyn Rapid Transit Company should increase its rolling stock by the addition of more commodious cars, provided with automatic signals to notify the motorman as soon as the doors are closed.

Bridge Commissioner Stevenson has severely criticized the report, saying that the new terminal arrangements have greatly relieved the congestion at the Brooklyn end of the bridge, although the congestion at the Manhattan end cannot be entirely removed until the Manhattan bridge is completed.

The commission has issued an order to the Union Railway of the Bronx to show cause why it should not completely overhaul its rolling stock and remedy a large number of defects reported by the commission's inspectors. A. W. McLimont, electrical engineer for the commission, has made a report, based on an inspection covering 46 days, that the company's rolling stock is in a most defective condition, which he ascribes to a lack of systematic and competent supervision.

Mr. McLimont summarizes the result of his inspection of the cars of the company as follows: Cars operated, 127; cars inspected, 112; cars with defective dashboards, 32; with broken headlights, 27; with insecure or broken steps, 43; with doors in need of repairs, 51; with curtains missing or in a dilapidated condition, 62; with windows in need of repair, 35; with controller faults, 37; with motor troubles, 29; with wiring troubles, 69; with defective trucks, 14; with bodies out of line, 23; with heat left on in barn, 36; with seats in bad condition, 25; with gear troubles, 67. The report also criticizes the overhead construction, which it says is badly in need of overhauling because maintenance has been so neglected and repairs so badly done that the service is impaired and there is danger from defective wiring.

At a hearing on February 13 the Interborough Rapid Transit Company was required to show cause why the temperature in the elevated cars should not be kept above 60

degrees. A report of one of the commission's inspectors showed that two-thirds of the cars inspected were at a temperature below 50 degrees.

On February 13 the commission held the first of a series of conferences with the chief executive and operating officials of all the various city railways, with the idea of securing co-operation for increasing the adequacy of service without the necessity of formal orders and hearings. Although no definite conclusions were announced it was reported that the conference had been of great benefit in promoting an exchange of ideas. Mr. Willcox, chairman of the commission, stated that his conception of adequate service included a seat for every passenger during non-rush hours. The railroad men agreed with this idea in general.

The commission has issued an order requiring the Interborough company to show cause why the subway cars should not be built with side doors. Bion J. Arnold of Chicago, who is preparing for the commission a report on subway conditions, has tentatively recommended side doors and has suggested a hearing on this question.

The board of estimate held a hearing on February 14 on the plans for the Broadway-Lexington avenue subway, but final consideration was postponed.

American Association Bulletin.—There has just been issued from the office of Secretary Swenson Bulletin No. 101 of the American Street and Interurban Railway Association. This is an especially important bulletin containing valuable information relative to platform expenses.

American Institute of Electrical Engineers, Ithaca Section.—Charles F. Scott, consulting engineer of the Westinghouse Electric & Manufacturing Company, was the guest of the Ithaca section on Friday, February 7, and gave a talk on the subject of "Limitations in High-Tension Transmission."

Old Denver Franchise Held Valid.—Judge Lewis of the United States district court at Denver on February 14 handed down a decision that a franchise granted in 1885 to the Denver Electric & Cable Railway, which was succeeded by the Denver City Tramway, and which made no provision as to its length of term, is still a valid contract, provided it has been lived up to by the company.

Chicago Car Cases Dismissed.—On motion of the city of Chicago the Illinois supreme court on February 13 entered an order dismissing the appeal of the city in cases against the Chicago City Railway and the receivers of the Chicago Union Traction Company involving alleged violations of the "public comfort" ordinances in regard to overcrowding and failure to keep the cars at the proper temperature.

American Institute of Electrical Engineers, Chicago Section.—At a meeting of the Chicago section of the American Institute of Electrical Engineers on Tuesday evening of this week Garrett T. Seeley, engineer of maintenance of the South Side Elevated Railroad, Chicago, presented an interesting paper, illustrated by lantern slides, on "The Extensions and Improvements of the South Side Elevated Railroad."

American Institute of Electrical Engineers, Pittsfield Section.—At the seventh meeting of the Pittsfield section of the American Institute of Electrical Engineers, held at the Hotel Wendell on February 6, 1908, H. J. Berg gave a talk on "The Phenomena Occurring on High-Voltage Power Transmission Lines." His remarks were accompanied with a number of diagrams and formulæ, and actual figures obtained by tests made under operating conditions were given.

Seeks Injunction Against Operation of Interurban Cars.—The city attorney of Terre Haute, Ind., has filed a petition for an injunction against the Terre Haute Indianapolis & Eastern Traction Company to restrain it from operating its interurban cars through the city and from erecting poles and wires for commercial lighting. It is claimed that the company has not secured the consent of the city for the operation of interurban cars or for doing a commercial lighting business.

Race Separation Law in Oklahoma.—The new law requiring the separation of races on railways and street railways in Oklahoma went into effect on February 16. On the Oklahoma City Railway the cars are not provided with separate compartments and signs were posted to indicate the seats reserved for negroes. It is reported that much dissatisfaction was manifested by the white people when the cars were crowded and that many violated the law and the company's regulations by taking the seats reserved for negroes rather than remain standing.

Municipal Ownership Proposed in San Francisco.—A petition signed by 14,616 voters of San Francisco has been submitted to the board of supervisors asking it to submit to the people at a special election the question whether the municipality should acquire the franchises and property of the United Railroads, the California Street Cable Railroad and two telephone companies, paying for the property by a bond issue. The charter requires a special election when requested by 15 per cent, or 8,715, of the voters. The validity of the signatures is yet to be tested.

Work on Air Line Stopped.—The Chicago-New York Electric Air Line Railroad, so widely advertised as the "10-dollar 10-hour" line from Chicago to New York, is reported to be in financial difficulties through failure to dispose of its stock, even at bargain rates. B. A. Mapledoram, chief engineer, has resigned, and the construction work in the vicinity of Laporte, Ind., has been practically abandoned. The road has been constructed 12 miles west of Laporte to Westville, 15 miles east of Gary, Ind., which President Miller now announces will be the western terminus of the line instead of Chicago.

Western Society of Engineers.—At an extra meeting of the Western Society of Engineers, held on February 19, Wilson E. Symons, manager Pioneer Truck Company, presented a paper entitled "The Passing of the Steam Locomotive." The author traced the development of both steam and electric traction and reached the conclusion that all methods of transportation, including steam and electric railways, canalized rivers and canals, will be required to serve the needs of the country, and would be extended and further improved in the future. He believed the electrification of steam railways in and near large centers of population was desirable as an important step toward the solution of the smoke question.

Weathering of Coal.—In a bulletin, No. 17, of the engineering experiment station of the University of Illinois, the subject of "The Weathering of Coal" is discussed by S. W. Parr and N. D. Hamilton. The bulletin relates to the weathering of coal and losses in fuel values which accompany storage under various conditions. The information heretofore available concerning the behavior of coal in storage is exceedingly meager. The results of tests, as outlined in this bulletin, add materially to the information available and open a way for a better understanding of matters pertaining to weathering, spontaneous combustion and other difficulties which attend the storage of coal in large masses. Deterioration has been studied with samples maintained in the open air, under cover at varying temperatures, in air-tight containers and in the submerged conditions.

Recent Accidents.—Eight persons were killed and 16 were injured last Saturday evening when a car of the Toledo & Western Railway was struck by a fast train of the Cleveland Cincinnati Chicago & St. Louis Railway, running over the tracks of the Michigan Central, at the crossing at West Toledo. At this point the Toledo & Western tracks cross the parallel tracks of the Michigan Central and of the Lake Shore & Michigan Southern railways, which are about 50 feet apart. There is no interlocking. The motorman of the electric car was killed and reports as to the exact circumstances differ. The conductor stated that his view of the train was partially obscured by a freight train on the Lake Shore tracks and that he did not see it coming until too late to stop the car. He said that the crossing bell did not ring. The car was struck in the center and was thrown for a considerable distance. The Ohio railroad commission has been making an investigation of the accident. At the coroner's investigation on Wednesday the testimony of the flagman at the crossing placed the blame on the dead motorman. He said that both he and the conductor had given signals with lanterns to stop the car, but that the motorman apparently paid no attention to them.—In a head-on collision between two cars of the Washington & Rockville Railroad on a steep grade near Rockville, Md., on February 13, several persons were injured. The accident is said to have been due to imperfect operation of the electric signal system. Both cars were badly wrecked.—A special passenger car on the Puget Sound Electric Railway collided with the rear of a freight train near Seattle, Wash., on February 13, seriously injuring four passengers and slightly injuring many others. The freight train had stopped, on account of a broken trolley wire, during a heavy fog and before a flagman could be sent back it was struck by the passenger car.—One man was killed and three injured in an accident to a construction car and trailer on the Omaha & Council Bluffs Street Railway at Omaha, Neb., on February 14. The accident occurred on a new piece of track down a steep incline. The rails were covered with snow and the cars got beyond the control of the motorman, running down hill to the end of the track, where the cars piled up. The motormen and three construction men were crushed in the wreckage.—Six passengers and a motorman were severely injured in a head-on collision between two cars of the Public Service Railway near Hackensack, N. J., on February 14.

Traffic and Transportation

James Dalrymple on Transfers.

The Cleveland Leader has been publishing a series of interviews with James Dalrymple, manager of the Glasgow corporation tramways. Concerning the transfer system Mr. Dalrymple is quoted as saying:

"With your system of transfers your average ride is more than twice as long as ours, and, therefore, I don't believe that you can reduce fares below five cents and expect to make a profit or even to pay expenses. I think the company must lose money on many of the long rides in Cleveland for a nickel fare. That is unfair to the company."

For Prevention of Accidents in Boston.

In pursuance of its endeavor to prevent accidents the Boston Elevated Railway has suggested rules for the guidance of drivers of vehicles, and it asks the co-operation of the public in the observance of the rules, which are as follows:

"1. Never cross a highway without first making sure that there is no other vehicle near enough to cause a collision.

"2. Never turn suddenly to a track when a car is approaching from either direction.

"3. Always cross streets and turn corners at a moderate rate of speed.

"4. In turning into another street do not 'cut the corner,' but make a full turn, keeping as far as possible to the right.

"5. Be sure your horse is, or engine and brakes are, under perfect control, especially where the streets are crooked; where the view is obstructed; or when passing cars which passengers are entering or leaving.

"6. Remember that a street car is confined to the track and that the motorman cannot turn out or stop his car instantly when 'cut off.'

"7. Do not rely upon the motorman to save you from the consequences of your own carelessness. He may not be able to do so.

"8. Where practicable keep on the right of the road and as far from the track as safety requires.

"9. Never turn upon a track in front of a car without first signaling the motorman your intention in time for him to make it safe for you to do so without risk.

"10. Remember that constant vigilance is the price of safety."

Rate Sheet of Twin City Lines.

The first rate sheet issued by the Twin City Rapid Transit Company in printed form has been received from A. W. Warnock, general passenger agent. It gives the rates for chartered cars and steamboat and special excursions on the interurban lines, effective on February 10.

No cars will be chartered to leave Minneapolis for Lake Minnetonka points, or vice versa, or to leave St. Paul for Stillwater, or vice versa, later than midnight. Among the rates quoted between Minneapolis and Lake Minnetonka are: "Excursion tickets for 50 or more persons, from ticket office to Excelsior, Tonka Bay or Deephaven and return, using regular service and good only on date stamped on face, 35 cents. For parties holding these tickets additional service to regular schedule will be provided on basis of 50 passengers to car. In case of failure to provide passengers, as per agreement, a charge of $2.50 per car will be made for each car furnished but not used. Regular 25-ride commutation ticket, $4.50. Students' 25-ride commutation ticket, sold only during school season, $3.25."

Other provisions of the rate sheet are as follows:

"Unless otherwise stated, all car rates provide for the use of large standard cars with load limited to capacity.

"All rates provide for a layover at destination of not to exceed five hours, after which a charge of $1.00 will be made for every hour or fraction thereof. Time to be consumed and total amount to be paid must be decided upon at time of charter.

"None of the following rates will apply to Sundays, holidays or any time when the service is taxed by large gatherings.

"All rates quoted are from any point on downtown 'loops.' A charge of $2.50 will be made for a 1-way or a round trip on any one local line in connection with any other trip given below."

Reduction in Fare to Chicago Suburb.—The Chicago Consolidated Traction Company has accepted a 20-year franchise from the village of River Forest and, in accordance with its terms, will reduce the fare between that village and Chicago from 10 to 5 cents.

No Seat No Fare Authority Denied.—City Solicitor Northup of Toledo, O., has rendered an opinion that the city council has not the authority to compel the Toledo Railways & Light Company to furnish a seat to every person who is required to pay a fare.

No Seat No Fare Ordinance.—An ordinance has been introduced into the city council of Portland, Ore., to compel the Portland Railway Light & Power Company to furnish sufficient cars to give every passenger a seat or to carry free those who are forced to stand.

Information Furnished to Kansas City Committee.—The Metropolitan Street Railway Company of Kansas City, Mo., has furnished all the information requested by the committee of the city council which is investigating the schedules and physical property of the company.

Plan for Department of Transportation in Chicago Abandoned.—The committee on "Local Transportation" of the city council of Chicago has abandoned the plan of creating a department to act on transportation matters, and the office of traction expert, which is now held by M. B. Hereley, will be continued.

Lower Fares Asked in Atlanta, Ga.—A hearing was to have been held by the Georgia railroad commission on February 11 on a petition urging that the Georgia Railway & Electric Company of Atlanta, Ga., be compelled to sell eight tickets for 25 cents, but a postponement until February 27 was announced.

Schedules in Savannah, Ga.—The Savannah (Ga.) Electric Company has presented to the city council of Savannah the report of the investigations by J. F. Vaughn into the schedules of the various roads. G. J. Baldwin, president of the company, stated that the separation of the races in the cars had cost the company a loss of $50,000.

Existence of Interurban Express Company to be Terminated.—Notice has been given that the existence of the Interurban Express Company, which conducts an express business between Louisville, Ky., and New Albany and Jeffersonville, Ind., on behalf of the Louisville & Southern Indiana Traction Company and the Louisville & Northern Railway & Lighting Company, will be terminated on March 5. After that date the freight business will be conducted directly by the companies under the jurisdiction of the interstate commerce commission.

Rates Between Springfield and Decatur, Ill.—B. R. Stephens, general traffic manager Illinois Traction System, Springfield, Ill., writes in regard to a report that very low rates would be made from Springfield to Decatur, Ill.: "I presume you have reference to the meetings of Evangelist Sunday at Decatur. We are not making any special rates to Decatur for these meetings with the exception of the usual Sunday rates, which are $1.00 from Springfield, $1.00 from Bloomington and $1.25 from Champaign round trip. We make these rates at all times; they have been in effect since the road was placed in operation."

Advertising the Marion Flyer.—An illustrated postal card has been issued by the Indiana Union Traction Company, Anderson, Ind., as an advertisement of its "Marion Flyer." There are two illustrations on the card, one of the interior of the car and the other of the exterior. The car is a chair car and excess fare is charged. For the trip from Indianapolis to Marion, 73 miles, the fare is $1.25 single ride, including 20 cents excess fare; the round-trip rate is $2.30. The time required for the trip from Indianapolis to Marion is two hours and 35 minutes. No stop is made between Anderson and Indianapolis, a distance of 39 miles.

The Chicago board of supervising engineers, in charge of the rehabilitation of the traction lines of the city, states that it may be a year before all the through routes specified in the ordinances passed last February can be placed in operation, although some of the routes can be made available in a short time. The tracks and curves of the Chicago Railways Company are not in a condition to permit the operation of the large double-truck cars used by the Chicago City Railway on the south side and there are many subways at railroad crossings which are two low for the south side cars. The Chicago City Railway owns a large number of small single-truck cars which could be used for through routing and members of the city council's committee on local transportation have advocated using these cars until changes can be made that will permit the operation of the larger cars. The board has fixed the general dimensions for the 400 new cars to be ordered by the Chicago Railways Company, providing for a narrower and lower car than those used by the Chicago City Railway Company.

Construction News

FRANCHISES.

Citronelle, Ala.—It is announced that C. A. Elkins, representing a syndicate which proposes to build an electric railway from Citronelle to Mobile, Ala., 30 miles, has secured a franchise for the operation of the line through Citronelle. A franchise also will be sought in Mobile for building the line from One-Mile Creek to Three-Mile Creek, the last-named of which is the northern boundary of the limits of Mobile. Later the county commissioners will be asked for right of way over the county road.

Greenville, Pa.—State Senator James M. Campbell of Mercer, Pa., representing a company which proposes to build an electric line from Greenville to Mercer and Sharon, has applied for a franchise in Greenville. Senator Campbell is said to have announced that the line would be built and that the first section to be constructed would be the Greenville line followed later by a line connecting Sharon and Mercer, Pa.

Ocean City, N. J.—A franchise has been granted to the Atlantic City & Ocean City Railroad to lay its tracks on Eighth street to the Boardwalk, thus giving a continuous track from the Atlantic City boardwalk to the Ocean City boardwalk.

RECENT INCORPORATIONS.

San Francisco & Bay Counties Railway, Oakland, Cal.—Incorporated in California for the purpose of extending the San Francisco Oakland & San Jose Railway (Key Route) from its present terminus in Oakland to San Jose, connecting with San Francisco by a ferry system. The road will extend from Emeryville through Oakland, Piedmont, Hayward and on to San Jose, 60 miles from San Francisco. A preliminary survey was made several months ago. Two branch lines, one from Oakland to Northbrae, 4½ miles, and another from Oakland to Claremont, 3½ miles, also are planned. It is stated that the new company is ready to start construction work as soon as the permanent route has been decided. Capital stock, $250,000. Incorporators: F. M. Smith, A. E. Herron, Oakland; George E. Pratt, Berkeley; F. C. Havens, Dennis Searles, Piedmont, Cal.

TRACK AND ROADWAY.

Accomac Power & Traction Company, Onancock, Va.—James D. Lalor, 1330 Arch street, Philadelphia, Pa., chief engineer of this proposed interurban line, writes that surveys have been completed and that grading will be started in about 60 days. The line will be for passenger and freight service and will serve the towns of Onancock, Tasley, Accomac, Tompkins Bay and Battle Point, Va., a total distance of 8½ miles. The bracket and cross-suspension type of overhead construction will be used. Plans and specifications are being prepared. No contracts have been let. Headquarters, Onancock, Va.

Atlanta Norcross & Gainesville Electric Railway, Gainesville, Ga.—H. D. Jacquish writes that this company, which proposes to build an electric railway from Atlanta to Gainesville, Ga., 50 miles, via Chamblee, Doranville, Duluth, Suwanee and Buford, has completed surveys from Atlanta to Norcross, 18 miles, and has applied for a charter. E. Philbrick, chief engineer, Baldwin, Ga.

Bayou Teche Railway & Light Company, New Iberia, la.—It is stated that 238 tons of steel rails are en route by water for the use in constructing this road between New Iberia and Jeannette, La., and that other material is on the ground. Work will be started in the near future. H. H. Fine, superintendent. (Noted January 18.)

Boston Elevated Railway, Boston, Mass.—The Boston transit commission has announced that it probably will be six months before the Washington street subway will be ready to turn over to the Boston Elevated Railway Company for operation. While the work is progressing satisfactorily in all departments, much remains to be done and it is believed that it will not be finished before next summer. The work of installing the electrical equipment, however, probably will be started by the company some time before the subway is completed.

Brownsville Carmichaels & Waynesburg Railway, Masontown, Pa.—This company, which is the Green county division of the Brownsville Masontown & Smithfield Street Railway, will soon be incorporated to build a 58-mile system of interurban roads in Green and Washington counties, Pennsylvania. It will be a single-phase line and will be constructed by the Masontown Construction Company, Masontown, Pa. The route in Green county is as follows: From Waynesburg east to Carmichaels and north by way of Jefferson to Rice's Landing. The route in Washington county includes Clarksville, Zollarsville and Bentleyville. A line also will be built from a point on the Monongahela river opposite Rice's Landing northeast to Brownsville in Fayette county. It is expected that work will be started this spring on the 15-mile section between Waynesburg and Rice's Landing. Several franchises have been secured by W. J. Sheldon, president, McKeesport, Pa., who also is president of the Brownsville Masontown & Smithfield Street Railway. It is stated that later the two roads probably will be consolidated. (Noted September 28, 1907.)

Calumet & Lac la Belle Traction & Power Company, Calumet, Mich.—Surveys have been completed and part of the right of way obtained for the construction of this proposed 10¼-mile electric railway from Calumet to Mohawk, Mich., and from Calumet to a point in Keweenaw county on Lake Superior. About two miles of subgrade have been completed, poles and ties are now being purchased and orders will be placed for steel the latter part of April. The greater part of the work will be done by the company, although contracts for a portion of the work have been let. H. J. Vivian, president; Earl K. Stewart, chief engineer, Calumet, Mich. (Noted January 18.)

Capital Traction Company, Washington, D. C.—A bill providing for an extension of this company's line from its present terminus at Fifth street and Nichols avenue, Congress Heights, along the avenue and the Livingstone road to Shepherds Landing, has been submitted by the commissioners to Representative Smith, chairman of the house district committee, with a request for enactment.

Central Arkansas Electric Railways Company, Pine Bluff, Ark.—A. M. Van Auken, chief engineer, writes that this company is now locating the permanent route for its interurban line from Pine Bluff to Little Rock and Hot Springs, 90 miles. About 20 miles of grading has been completed and work will be resumed in June. It is not expected that the present management will complete the line. As soon as financial arrangements have been made the contract for the construction of the road will be let to one of the large engineering and contracting companies. The power house of the company will be located at Junction City, near Sheridan, in Grant county, where large coal deposits are located. J. A. Holmes, president, Pine Bluff, Ark.; D. H. Saunders, vice-president; T. M. Hooker, secretary and attorney; F. L. Cramer, treasurer.

Cleveland Southwestern & Columbus Railway, Cleveland, O.—With the exception of ballasting, the 15-mile section of this company's Cleveland Ashland & Mansfield extension between Ashland and Mansfield, O., has been completed, and it is expected that cars will be operated by April 1. About 15 miles of grading east from Mansfield has been done and work on this section will be resumed about the first of April. C. N. Wilcoxon, general manager, Cleveland, O.

Dallas Interurban Electric Railway, Dallas, Tex.—This company, which was incorporated in Texas several months ago to build 30 miles of street railway in Dallas and interurban lines from Dallas to Sherman, Denison, Greenville, Terrell and Tyler, Tex., has elected officers as follows: Henry Dorsey, president; I. J. Willingham, first vice-president; Robert Ralston, second vice-president; M. H. Wolfe, third vice-president; S. A. Stemmons, secretary; W. W. Caruth, treasurer; W. H. Clark and W. T. Henry, general counsel.

Des Moines & Sioux City Railway, Lake City, Ia.—A. O. Anderson, secretary of this company, writes that a partial organization of this company which proposes to build an electric railway serving Des Moines, Sac City, Storm Lake and Lake City, Ia., was effected on February 18 at a meeting of delegates from these cities. The following officers were elected: President, S. N. Elwood, Sac City; vice-president, M. H. Miller, Ft. Dodge; secretary, A. O. Anderson, Lake City; treasurer, E. M. Bailey, Sac City. He states that at present the organization is not sufficiently advanced to let contracts for the engineering work. Preliminary plans are under way. The headquarters of the company will be at Lake City, Ia.

Des Moines Winterset & Creston Electric Railway, Des Moines, Ia.—At a meeting of the executive committee held last week the resignation of A. E. Park, who has been general manager since this road was organized early in 1906, was accepted. E. B. Steere, vice-president of the company, was elected general manager to succeed him.

Elkins Electric Railroad, Elkins, W. Va.—This company has completed its line in Elkins and is now grading at a point about two miles out of Elkins. Surveys have been completed

as far as Harding and the work is to be pushed as fast as the weather will permit.

Evansville Mt. Carmel & Olney Interurban Railway.—At a meeting held at Grayville, Ill., by those interested in the construction of an interurban railway from Olney, Ill., to Evansville, Ind., it was decided to incorporate the new company under the above name. The road will serve Evansville, Cynthiana, Mt. Carmel, Lancaster and Olney. Aden Knopp, Olney, Ill., is president; G. W. Courter, Mt. Carmel, is secretary. Others interested are: C. J. Seibert, E. O. Lockyear, Jacob Laubscher, Evansville; E. B. Bixley, Thomas Newell, Cynthiana; J. O. Smith, J. F. Seibert, Lancaster; Aden Knopp, J. F. Hyatt, F. N. Boyer, Olney.

Freeport, Ill.—Right of way is being secured by Frank Zinnel for the construction of an interurban railway from Freeport southwest to Savanna, Ill., by way of Florence, Shannon, Lanark and Mt. Carroll, Ill. If the line is built it will form, by means of the existing electric lines, a direct connection from Chicago to the Mississippi river by way of Elgin, Belvidere, Rockford and Freeport.

Gary & Interurban Railroad, Gary, Ind.—It is reported that this company has suspended construction work on its proposed line in Gary.

Illinois Traction System, Champaign, Ill.—The Illinois railroad and warehouse commission has ordered this company to construct an elevated crossing over the tracks of the Chicago & Alton and Illinois Central railroads for its line entering the city of Lincoln. The crossing is required to be completed by October 1.

Interstate Electric Railway, St. Joseph, Mo.—It is announced that this company expects to start grading this spring on its proposed electric line from St. Joseph to Kansas City, Mo., by way of Dearborn and Liberty. Right of way has been secured. Smith H. Bracey, 1606 Tribune building, Chicago, will have charge of the construction. (Noted June 15, 1907.)

Inter-Urban Railway, Des Moines, Ia.—We are advised by F. S. Cummins, chief engineer, that the report that this company is contemplating an extension from Woodward to Ogden, Ia., as published in the Electric Railway Review of February 8, is incorrect.

Los Angeles Pacific Company, Los Angeles, Cal.—Right of way for the proposed extension of this company's Hollywood line through Cahuenga pass toward Toluca, Burbank and Glendale, Cal., has been secured. The building of this line is believed to be a part of the joint plans of the Los Angeles Pacific and the Southern Pacific companies to electrify all of the local lines of the steam road in the vicinity of Los Angeles, and to bring the large fruit growing and farming districts of southern California into trolley as well as steam connection with Los Angeles. The proposed line will follow as closely as possible the county highway through Cahuenga pass to Toluca, where it crosses the Southern Pacific's local line from Chatsworth park on the coast through Canoga, Reseda, Encino and Toluca to Burbank and Glendale and from there into the city. The company has five years in which to construct the line, but it is believed that it will be completed and in operation much before that time.

Milwaukee (Wis.) Electric Railway & Light Company.—It is announced that work on the extension from Oconomowoc to Watertown, Wis., will be resumed as soon as the weather will permit and completed as soon as possible.

New York & North Shore Traction Company.—The first 10 miles of this company's proposed electric line from Mineola to Roslyn, by way of Port Washington, N. Y., is said to have been completed. A franchise for six miles additional from Roslyn to the New York City line has been secured and a franchise covering six more miles from the New York City line to Flushing has been applied for. At Flushing it will connect with the New York & Queen's County Railway for entrance to Forty-second street on Manhattan island by way of the Steinway tube. (Noted July 6, 1907.)

North Midland Electric Railway, London, Ont.—The work of surveying the route of this railway has been started. Two surveys will be taken, one via Bryanston and the other via Thorndale, the terminus at present being Stratford. It is estimated that the Thorndale route will save the erection of two bridges, at London and Devizes, and an outlay by the company of at least $70,000. A. E. Welch of London, Ont., will leave shortly for London, Eng., with the object of financing the project.

Puget Sound International Railway & Power Company.—This company, which was incorporated last summer by the Stone & Webster interests to build an extensive system of interurban railways in the state of Washington and to improve its existing street and interurban lines, is now securing options on the right of way over an alternate route by way of Belfast and Lake Samish from Burlington to Bellingham, Wash. By this alternate route the distance between these points will be shortened about two miles. The entire distance which this section of the system will cover from Seattle to Bellingham is 97 miles. (Noted June 22, 1907.)

St. Joseph & Stratford Radial Railway.—We are advised that a company to be organized under the above name proposes to build an electric railway from St. Joseph to Stratford, Ont., and that our item of February 8, page 190, connecting this proposed line with the Ontario West Shore Electric Railway is incorrect.

St. Louis Montesano & Southern Railway, St. Louis, Mo.—This company has begun construction work by erecting the poles for its proposed electric line on the Lemay ferry road. The line will connect St. Louis and Joplin, Mo., crossing the Meramec river, and when completed will be 65 miles long. Charles W. Gutke, 5727 Von Versen avenue, St. Louis, Mo., is president. (Noted October 19, 1907.)

Seattle, Wash.—F. X. Waldron & Co., Seattle, Wash., are said to be promoting the construction of an electric railway on Vashon island, from its northern to its southern extremity, 12 miles. At either end of the island connection will be afforded by fast running ferries to Seattle on the north and Tacoma on the south. The distance by water would be about 12 miles, making a total length of 24 miles by this route between the two cities as against 29 miles by the present water route, 39 miles by the existing interurban routes and 42 miles by the Northern Pacific. It is stated that the road will cost about $350,000, of which enough has been subscribed to warrant starting construction work as soon as franchises have been obtained. It will be practically an air line and the grade is said not to exceed 3 per cent. Application has been made by the promoters to the county commissioners for a 40-year franchise in King county and when this has been secured incorporation papers will be filed and work started on the island.

Spokane & Inland Empire Railroad, Spokane, Wash.—J. P. Graves, president, has made a proposition to the directors of the Lewiston & Southeastern Electric Railway of Lewiston, Idaho, to acquire that company's property and franchises, reimburse the stockholders for the money expended in surveys, etc., and to build the proposed road from Lewiston to Grangeville and Nez Perce, Idaho. The plans are conditional on the success of Mr. Graves' financial negotiations. The Lewiston & Southeastern, of which G. W. Thompson is president, has acquired valuable franchises in Lewiston and elsewhere, and has completed surveys and considerable grading.

Washington Railway & Electric Company, Washington, D. C.—Preliminary surveys for the extension of the Washington & Rockville Railroad, which is controlled by the Washington Railway & Electric Company, from its present terminus in Rockville to the extreme western limits of the city, were started on February 12. The route will lie along the main street of Rockville. It is understood that later on the road will be extended west to Gaithersburg, about five miles. H. W. Fuller, general manager, Washington, D. C.

Waterloo Cedar Falls & Northern Railway, Waterloo, Ia.—This company contemplates building an extension from the business district of Waterloo to Sans Souci, an amusement park, 2½ miles. M. L. Newton is chief engineer.

POWER HOUSES AND SUBSTATIONS.

Des Moines (Ia.) City Railway.—At the annual meeting last week plans were discussed for increasing the capacity of the company's power house by 1,500 horsepower.

Great Northern Railway.—Contractors will begin work early in March on a hydro-electric plant at Leavenworth, Wash., west of Spokane. The plant will furnish power to run trains over the mountains from Leavenworth to Skykomish, and will be one of the largest in Washington. Four electric generators, each having a capacity of 1,300 horsepower, will be installed. The company has been working in Tumwater canyon more than six months preparing a suitable site for the plant and sidetracks.

Lewiston Augusta & Waterville Street Railway, Lewiston, Me.—This company has let contracts for the electrical equipment of two substations to the General Electric Company, Schenectady, N. Y. The stations will be located at Vassalboro and Monmouth, Me. E. D. Reed, general manager, Lewiston, Me. (Noted January 18.)

Waterloo Cedar Falls & Northern Railway, Waterloo, Ia.—It is reported that this company will install one 400-kilowatt generator and an additional water tube boiler. M. L. Newton is chief engineer.

Personal Mention

Mr. P. F. Cassidy has been appointed claim attorney for the Uxbridge & Blackstone Street Railway Company, Uxbridge, Mass.

Mr. J. P. Clark has been appointed assistant to President M. W. Mills of the Michigan United Railways, with office at Jackson, Mich., with full authority to act for the president. Mr. J. M. Bramlette, general manager, will still have full charge of the operation of the road, reporting to the president or to the assistant to the president.

Mr. W. J. Dunston has been appointed master mechanic of the Sterling Dixon & Eastern Electric Railway, effective on February 1. He formerly was connected for five years with the Jacksonville (Ill.) Railway & Light Company and since April, 1906, has been master mechanic of the Winnebago Traction Company at Oshkosh, Wis.

Mr. Joseph Colvin, superintendent and purchasing agent of the Washington Alexandria & Mt. Vernon Railway, with headquarters at Alexandria, Va., has been transferred to the general offices of the company at Philadelphia. He will be succeeded at Alexandria by Mr. R. W. King, a brother of Mr. C. P. King, president of the company.

Mr. H. E. Chubbuck, general manager of the Illinois Valley Railway, Ottawa, Ill., has been appointed superintendent of the Wichita (Kan.) Railroad & Light Company, succeeding Mr. W. B. Morrison, resigned. This is one of the properties owned by the McKinley interests, with which Mr. Chubbuck has been identified in Illinois since 1897.

Mr. J. S. McWhirter has resigned as superintendent of car equipment of the Mahoning & Shenango Railway & Light Company at Youngstown, O., to accept a similar position with the Third Avenue Railroad, New York City. Mr. McWhirter was for a number of years connected with the Brooklyn Rapid Transit Company and the Interborough Rapid Transit Company of New York.

At the annual meeting of the Chicago City Railway on February 17 Mr. Thomas E. Mitten was re-elected president; Mr. R. B. Hamilton, secretary and purchasing agent, was elected vice-president; Mr. F. D. Hoffman, treasurer, was elected secretary also; Mr. J. J. Duck was retained as auditor; Mr. Simon R. Flynn, president of the National Live Stock Bank, was elected a director to succeed Mr. S. M. Felton, resigned.

Mr. S. W. Huff, general manager of the Virginia Passenger & Power Company, Richmond, Va., has been elected president of the Coney Island & Brooklyn Railroad, Brooklyn, N. Y., effective on March 1, succeeding Mr. John L. Heins, resigned, as noted in our issue of last week. Mr. Huff is a graduate of the electrical engineering department of Cornell University and has been with the Virginia Passenger & Power Company since July, 1902. He was formerly assistant superintendent of the Baxter Electric Motor & Manufacturing Company, Baltimore, Md., and later became general manager of the street railway lines in Raleigh, N. C. He also at various times has been connected with the electric railroads of Baltimore, San Francisco and Philadelphia.

Mr. J. S. Pevear has been appointed superintendent of the St. Paul lines of the Twin City Rapid Transit Company, succeeding Mr. Fenwick E. Low, resigned on account of ill health. Mr. Pevear has been connected with the General Electric Company in construction and operation work for seven years, for the past year and a half with the Chicago office of the company. Mr. Lowe has been superintendent of the St. Paul lines for about a year and was previously for one year chief clerk to the general manager. He was formerly for several years general agent of the Pullman Company at Minneapolis. Mr. G. Brigger, superintendent of the Minneapolis lines of the Twin City Rapid Transit Company, has resigned on account of ill health, after 12 years' service in that position. Mr. P. W. Gerhardt, who was recently appointed assistant to the general manager, will succeed Mr. Brigger temporarily as acting superintendent.

Obituary.

J. A. Carothers, for a number of years president of the Bloomington Pontiac & Joliet Electric Railway, died at his home in Pontiac, Ill., on February 19, aged 45 years. His control of the road was terminated last fall when it was acquired by the Fisher interests of Joliet for the purpose of extending it to Dwight, Ill. At the time of his death Mr. Carothers was president of the Pontiac Light Heat & Power Company.

Financial News

Camden & Trenton Railway, Camden, N. J.—William F. Sadler, Jr., of Trenton, N. J., was appointed receiver for this company on February 18 by Vice-Chancellor Walker of Trenton. The proceedings for the appointment of a receiver were begun by Henry V. Massey of Philadelphia, who filed a bill making the following allegations: That the Camden & Trenton line has been operated at a loss for a long period, the deficit for 1907 having been $46,558.90; that on January 1, 1907, the general deficit was $66,951.37, and that it now amounts to $115,000; that the company has other debts and losses aggregating, with the foregoing, about $200,000; that the company defaulted on November 1, 1907, in the payment of interest on its first mortgage bonds, amounting to $17,750, and also defaulted on January 1, 1908, in the payment of interest on its general mortgage bonds, amounting to $15,562; and further that the company is unable to meet maturing obligations. The bill charges that the officers of the New York-Philadelphia Company, which controls the property, have "so recklessly mismanaged the Camden & Trenton Railway that they have entirely destroyed its credit and have produced a condition of insolvency."

Chicago City Railway.—S. M. Felton has resigned as a director on account of his removal from Chicago and S. R. Flynn, president of the National Live Stock bank of Chicago, has been elected to succeed him.

Chicago Lake Shore & South Bend Railway, South Bend, Ind.—A trust deed has been filed with the Cleveland Trust Company, as trustee, to secure an issue of $6,000,000 of 5 per cent 40-year first mortgage bonds, dated August 15, 1907. Issues of $5,000,000 of common stock and $1,000,000 of preferred non-cumulative stock have been authorized.

Chicago & Milwaukee Electric Railroad.—Bion J. Arnold has been employed by the receivers to estimate the cost of completing the road to Milwaukee, supplementing the report of the engineers of the company.—George M. Seward, receiver for A. C. Frost & Co., states that Ravinia park will be operated next year as usual. It is said that the property may be leased to a private corporation.

Chicago Railways Company.—A stipulation has been filed in the United States circuit court at Chicago, extending the time for deposit of the stocks and bonds of the Chicago Union Traction Company and underlying roads until August 1, so that holders who have not previously assented to the reorganization plan now have an opportunity to participate.

Exeter Hampton & Amesbury Street Railway, Exeter, N. H.—In accordance with a decree entered by the superior court of New Hampshire on November 7, 1907, the property of this company will be sold on March 10.

Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.—Gross earnings in 1907 were $1,283,722, an increase of $191,076 over 1906. Expenses were $746,036, an increase of $87,576. Net earnings were $537,686, an increase of $105,500. Other income was $58, a decrease of $102. Total income was $537,744, an increase of $105,398. Interest and taxes were $427,314, an increase of $63,082. The surplus was $110,430, an increase of $42,316.

Gray's Harbor Railway & Light Company, Aberdeen, Wash.—The $150,000 of first mortgage 6 per cent bonds held in reserve has been issued, making the total amount outstanding $500,000. Gross earnings in 1907 were $193,744. Operating expenses and taxes amounted to $105,273, leaving net earnings of $88,471. Interest charges were $24,719, leaving a surplus of $63,752.

Indiana Union Traction Company.—Earnings in the year 1907 were as follows: Gross earnings, $2,089,232.50; operating expenses, $1,111,198.48; net earnings, $978,034.02; interest on Union Traction Company of Indiana, Indianapolis Northern Traction Company, Muncie Hartford & Ft. Wayne Railway and other underlying bonds, also taxes, $728,115; net income, $249,919.02; dividends on stocks of Union Traction Company of Indiana and Muncie Hartford & Ft. Wayne Railway, and interest on Indiana Union Traction Company bonds, $229,896.66; surplus, $20,022.36.

Interborough-Metropolitan Company.—T. P. Shonts, the president, has issued a statement to shareholders, which shows that there was a balance in the income account on December 31, 1906, of $524,924; there was added to this amount in 1907 $3,052,151 dividends on Interborough Rapid Transit Company stock owned, $1,495,900 dividends received from Metropolitan Street Railway stock before the appointment of receivers, and

$205,500 interest on bank balances, making a total for all items of $5,278,485. Interest paid and accrued during the year on Interborough-Metropolitan 4½ per cent collateral trust bonds amounted to $3,052,125, the two dividends paid on Interborough-Metropolitan preferred stock amounted to $1,143,500, expenses were $212,184, and taxes $103,760, making total disbursements of $4,511,569. The surplus in the income account on December 31, 1907, was therefore $766,916. The miles of track of companies comprising the Interborough-Metropolitan system were: Interborough Rapid Transit Company subway, 72.48 miles; Interborough Rapid Transit Company elevated, 118.05 miles; surface lines owned or controlled by Interborough Rapid Transit Company, 154.03 miles; New York City Railway and subsidiary companies, 519.46 miles; total (single track), 864.02 miles. Mr. Shonts adds: "The earnings of the Interborough Rapid Transit Company continue good; the surplus for the year ending June 30, 1907, after the payment of all interest charges, the guaranteed dividend on Manhattan Elevated Railway Company stock and dividends on its own stock, being $566,443, as against $281,390 for the previous year, an increase of $285,053. The surplus for the last six months of the calendar year shows a gain over the corresponding period of last year, and the under-river section of the Brooklyn extension, which was opened for operation on January 9, 1908, is adding to this surplus at the estimated rate of $700,000 per annum. It is also anticipated that a further increase will result from the opening of the remainder of the Brooklyn extension about April 1, 1908." The balance sheet of the Interborough-Metropolitan Company shows $4,545,000 notes payable. The principal assets are stated as follows: Interborough Rapid Transit Company capital stock, at cost in securities of this company, $104,563,042; Metropolitan Street Railway Company capital stock, at cost in securities of this company, $68,684,455; Metropolitan Securities Company capital stock, at cost in securities of this company, $28,329,695.

Louisville (Ky.) Railway.—Gross earnings in 1907 were $2,668,146 and operating expenses were $1,551,949, leaving a balance of $1,116,197. Taxes were $216,000 and interest charges amounted to $368,126. The surplus after the payment of dividends was $35,334.

Macon (Ga.) Railway & Light Company.—Gross earnings in 1907 were $355,387, as compared with $290,345 in 1906. Net earnings were $149,266, as compared with $105,002. Interest and taxes were $67,260, as compared with $59,547. The surplus in 1907, after provision for dividends, was $64,990, as compared with a surplus of $28,440 in 1906.

Manchester & Derry Street Railway, Manchester, N. H.—A trust deed has been given to the American Trust Company of Boston, as trustee, to secure an issue of $500,000 of first mortgage 20-year 5 per cent bonds. The bonds are guaranteed, principal and interest, by the Manchester Traction Light & Power Company.

Toledo & Chicago Interurban Railway, Toledo, O.—James D. Mortimer has been appointed receiver for this road by Judge Heaton of the Allen county circuit court at Kendallville, Ind.

United Railways & Electric Company, Baltimore, Md.—The agreement for deposit of the stock will expire on February 25, 1908, and Alexander Brown, H. Crawford Black and F. A. Furst have been requested by holders of a large amount of stock to act as trustees under a new agreement to continue in force until May, 1911.

ELECTRIC RAILWAY EARNINGS.

Aurora Elgin & Chicago Railroad.

January—	1908.	1907.
Gross receipts	$93,984.99	$88,892.60
Operating expenses	58,903.39	56,167.77
Net earnings	35,081.60	32,724.83
Deductions	28,532.34	26,491.65
Surplus	6,549.26	6,233.18

United Railways of St. Louis.

January—	1908.	1907.
Gross earnings and other income	$827,398	$826,337
Expenses, taxes and depreciation	554,359	577,870
Net earnings	273,039	248,467
Charges	233,454	231,541
Net income	39,585	16,926

Dividends Declared.

American Railways Company, Philadelphia, quarterly, 1½ per cent.

Columbus (O.) Railway, common, quarterly, 1¼ per cent.

Kansas City Railway & Light Company, preferred, quarterly, 1¼ per cent.

Manufactures and Supplies

ROLLING STOCK.

Third Avenue Railroad, New York, has ordered 50 closed and 25 open double-truck cars from The J. G. Brill Company.

Lawrence County Railroad, Little Rock, Ark., under construction from Hoxie, Ark., to Smithville, Ark., is in the market for one passenger motor car.

Aurora Elgin & Chicago Railroad, Chicago, has placed an order with the McGuire-Cummings Manufacturing Company for two sets of trucks, to be placed under old cars.

St. Paul City Railway, St. Paul, Minn., will receive 12 new cars on March 1. These cars are being built in the shops of the Twin City Rapid Transit Company, at Minneapolis.

Interborough Rapid Transit Company will have to show cause to the public service commission of New York why all cars bought in the future, as well as those now in operation, should not be equipped with side doors. Counsel to the commission has been asked to cite reasons, if any, why an order of the sort should not be issued.

Chicago Railways Company, Chicago, is authorized by the board of supervising engineers to secure bids on 400 pay-as-you-enter cars, constructed in accordance with the following general specifications. The detailed specifications are to be prepared by the chief engineer of the board and approved by the board before the order is placed. The center aisle is to be not less than 23 inches wide. All cross seats are to be not less than 36 inches in length and are to be cushioned. The height of the cars from top of rail to top of trolley board is to be not less than 11 feet 8 inches, nor more than 11 feet 10 inches. The length over the end posts of the car bodies shall be not less than 32 feet nor more than 32 feet 5 inches. The length of platform shall be 8 feet 4½ inches and the length of the cars over all not less than 48 feet 9 inches nor more than 49 feet 2 inches. The width over all is to be not less than 8 feet 9 inches. The diameter of wheels is to be 34 inches for steel wheels and 33 inches for cast-iron wheels. The distance between wheel centers must be 4 feet 6 inches and the distance between center pins of trucks 20 feet to 20 feet 5 inches.

SHOPS AND BUILDINGS.

Roanoke Railway & Electric Company, Roanoke, Va.—This company has sold to the Norfolk & Western Railway the property on Earnest avenue, near the center of Roanoke, on which its car barn and power station are located, the consideration being $40,000 cash and three small parcels of land on Walnut street adjoining its new power station, which is practically completed. The electric railway company is to remove the buildings and their contents from the property sold the Norfolk & Western, but retains possession for 18 months. During that time the electric company will build a new and modern car barn on Walnut street.

Williamsport (Pa.) Passenger Railway.—It is reported that this company is contemplating the erection of a new repair shop.

TRADE NOTES.

Quincy-Manchester-Sargent Company has removed its general offices from 90 West street, New York, to its factory at Plainfield.

A. P. Bowen, who has been purchasing agent of the Western Steel Car & Foundry Company and the Anniston Car Company, on February 15 also assumed the duties of purchasing agent of the Pressed Steel Car Company.

Charles T. Mordock, member of the board of expert engineers of the Stone & Webster Engineering Corporation at Boston, Mass., has been transferred to the Chicago office of the company in the First National Bank building.

C. A. Denman, whose resignation as superintendent of the Cleveland & Garrettsville division of the Eastern Ohio Traction Company, Cleveland, was announced in our issue of January 4, is now located with the Perfection Pipe Company at Toledo, O.

Paul B. Patten, Salem, Mass., manufacturer of the ticket-destroying machine which has been found so necessary by the large street and interurban railways in this country, reports that the machine is being recognized as the best device for its purpose by officials in many parts of the world. The West Indies Electric Company, Limited, Kingston, Jamaica, in re-

fitting the road after the earthquake, bought these machines. J. G. White & Co. ordered an outfit for the Manila Street Railway. The Reading Tramways Company of Reading, England, and the street railway company at Sydney, N. S. W., have recently installed machines.

Western Wire Sales Company, 356 Dearborn street, Chicago, has been sold to a new organization, the officers of which are: Richard Wick, president; Fred B. Keller, secretary and treasurer; and F. W. Page, sales manager. J. Allen Haines and A. Conro Fiero formerly owned this company.

Zelnicker Crayon Works, St. Louis, Mo., has just put on the market a new crayon called the "Suremark." This name was adopted, the company states, because the new crayon makes a sure mark that will remain on any surface, particularly highly polished ones, such as tin, brass, glass, paper, etc. The yellow is particularly good for marking iron castings.

Louis J. Bergdoll and **George F. Pawling** announce that they have formed a partnership under the firm name of Bergdoll & Pawling, with offices at Broad and Wood streets, Philadelphia. The new firm will engage in engineering and contracting work in structural steel and iron. Mr. Pawling was formerly contracting engineer for the Belmont Iron Works.

John A. Roebling's Sons Company, Trenton, N. J., on February 5 lost one of its rope shops. The company states that compared with the other shops the one destroyed was of minor importance and the productive capacity of the remaining shops will enable it to continue its usual prompt shipments of wire rope. The shop will be rebuilt immediately.

Alfred Box & Co., Front and Poplar streets, Philadelphia, have been awarded the contract for the crane equipment of a power station and two substations of the Coney Island & Brooklyn Railroad for which Ford, Bacon & Davis, New York, are engineers. A 30-ton capacity hand-power traveling crane will be installed in the central power station now under construction at Smith and Ninth streets, and 10-ton traveling cranes in the two substations located at King's highway and at Sanford street.

William Jennings Company, El Paso, Tex., mechanical and electrical engineer and dealer in railway and general supplies, has recently been organized by William Jennings, who resigned on October 31, 1907, as mechanical and electrical superintendent of the Los Angeles Interurban Railway and the Pacific Electric Railway of Los Angeles, Cal. Prior to going to Los Angeles Mr. Jennings was for about 19 years superintendent of motive power and machinery of the Mexican International Railroad.

Dossert & Co., New York, are making further large shipments of their solderless 2-way connectors, to be used in the wiring of the 85 steel passenger cars now being completed by the Pressed Steel Car Company at McKees Rocks, Pa., for the Pennsylvania Railroad. These cars will be used on the main line between New York and Chicago. They will be electrically lighted and no solder will be used in the splicing. The Dossert joints are installed in junction boxes underneath the car floors, where the No. 0000 feeder cables are connected up.

Chicago Pneumatic Tool Company, Chicago, at its annual meeting held in Jersey City, N. J., on February 17, submitted a report for the year 1907. The income account was as follows: Profits, $848,007; depreciation, repairs and renewals, $161,577; written off for developing new tools, $15,018; net profits, $671,412; bond interest, $115,000; interest on mortgage assumed, $2,129; sinking fund instalment, $50,000; earned on stock, $504,283; dividends, 3 per cent, $190,063; surplus, $314,219. From the surplus of $878,409 on hand on December 31, 1907, there was appropriated $100,000 for foreign subsidiary companies and $84,554 for special depreciation on plants and investments. The balance, added to the foregoing surplus for 1907, made a total surplus of $1,008,074.

Railway Specialty & Supply Company, Chicago agent of the Pittsburg Lamp Brass & Glass Company, states that the bulk of the signal glass, lenses and roundels in the yards of the new Washington terminal is Kopp signal glass. The photometric limits were selected after a series of joint conferences and tests by the signal officials of the Pennsylvania Railroad and Baltimore & Ohio. It is said that at night this yard presents one of the finest displays of signal illumination that can be seen anywhere. The range of the lights and the purity of their hue, both of which are responsible to a large degree for the efficiency of any signal, are especially prominent. The Railway Specialty & Supply Company states that these results are practically due to the elaborate care given in the production and examination of the glass. Each piece is subjected to four tests before shipment and goes out with its individual photometric value as determined from these tests marked upon it. This prevents lenses of inaccurate construction or any glass of poor hue or improper illuminating power finding a place in a signal installation equipped with Kopp glass.

The J. G. Brill Company's report for the year ended December 31, 1907, shows the largest business in the history of the company. The gross business was $9,211,825. This included the results of the operation of the company's five plants at Philadelphia, St. Louis, Cleveland, Elizabeth, N. J., and Springfield, Mass. The Springfield plant was not acquired by the Brill interests until April, so the gross earnings it contributed are for nine months. The company charged off for depreciation $120,441 and for repairs to buildings, machinery and tools, $180,250, leaving a net profit of $1,368,949. Out of this $228,725 was paid in dividends on the preferred stock and $146,849 in dividends on the common stock, leaving a surplus of $993,375, which was credited to surplus. The total surplus account is now $1,703,104.

Electric Traction Supply Company, St. Louis, Mo., following its general policy of expansion, has established an office at 1200-1202 Fisher building, Chicago, in charge of Frank D. Willis. The Chicago office will look after the northwest territory, including northern Illinois, Iowa, Minnesota, Wisconsin, Michigan and northern Indiana, and Mr. Willis will take occasion to visit this territory at an early date. The establishing of this office will facilitate the handling of business in this territory and enable patrons of the company to secure more prompt service. Mr. Willis has been representing the Sterling-Meaker Company of Newark, N. J., in the west for a number of years, and as the Electric Traction Supply Company has been appointed agent for the eastern company, he will continue to sell Sterling-Meaker products, in addition to the large line furnished by his new connection.

Wynn Meredith, member of the American Institute of Electrical Engineers, has become a partner in the firm of Sanderson & Porter and will have charge of the western office which they have opened in the Union Trust building, San Francisco, Cal. After a technical training at the University of Illinois Mr. Meredith in 1888 became engaged in the construction and operation of lighting and railway properties. He was actively connected with the engineering and operation of the electrical plant of the World's Fair at Chicago in 1893, and the California fair in 1894, subsequently becoming associated with Messrs. Hasson & Hunt, and later a member of the firm of Hunt, Dillman, Meredith & Allen, San Francisco, Cal. During 15 years' residence in California Mr. Meredith has been engaged in general engineering work and prominently identified with many of the important hydro-electric and transmission developments on the Pacific coast, in the United States and Canada.

General Electric Company, Schenectady, N. Y., in order to provide for the heavy demand for Edison lamps, and to take care of the new developments in Gem, Tantalum and Tungsten lamps, has in the past year built four new factories at East Boston, Toledo, O., Ft. Wayne, Ind., and Newark, N. J. The factory at Toledo is confined to the production of Gem filament lamps; the Newark factory to Tungsten lamps only, and the factories at East Boston and Ft. Wayne to the regular carbon filament lamps. In addition the General Electric Company has erected a new factory building at Harrison, N. J., adjoining the present lamp factory, which is devoted to the production of Tungsten lamps. Besides these new factories the main factory at Harrison, N. J., continues its large output of carbon and Gem filament lamps. The total productive facilities of the General Electric Company now aggregate 60,000,000 lamps a year, so that it is in excellent position to supply all demands from customers.

Dearborn Drug & Chemical Works.—Robert F. Carr and several of his associates in the Dearborn Drug & Chemical Works have purchased the holdings in the Dearborn Drug & Chemical Works of the estate of the late William H. Edgar, who died two years ago, and the following officers have been chosen: Robert F. Carr, president and general manager; George R. Carr, vice-president; Grant W. Spear, vice-president; William B. McVicker, vice-president and eastern manager; J. D. Purcell, assistant general manager; W. A. Converse, assistant secretary and chemical director; R. R. Browning, assistant treasurer; A. E. Carpenter, superintendent. C. M. Eddy's holdings were also taken over, he desiring to devote all of his time to his personal business interests. Robert F. Carr became connected with the company very soon after it was organized, entering the business shortly following his graduation in chemistry from the University of Illinois in 1893; for the past 10 years he has been vice-president and general manager of the company, and for most of that time, especially the last few years, has been actively in charge of the business and organization. George R. Carr has been con-

nected with the company since he graduated from the University of Illinois in chemistry in 1901. He has occupied the position of assistant general manager of the company for the past four years, devoting his time largely to the railroad department of the business. G. W. Spear, who is a graduate in mechanical engineering, University of Illinois, entered the business in 1895. He has been one of the vice-presidents of the company for five years, in charge of the branch offices in the central district of the United States, having his headquarters at the general offices in Chicago. William B. McVicker has been connected with the company for 13 years, having during most of that time been at the head of the eastern department; for several years he has been second vice-president and eastern manager, having charge of the general eastern offices at 299 Broadway, New York, and the eastern branches reporting to New York, including Havana, Cuba. W. A. Converse, who was elected to the position of assistant secretary, in addition to the office of chemical director, which he has previously held, has been in charge of the laboratories for the past 12 years. Mr. Converse's ability as a chemist is well known. He has for several years been secretary of the Chicago section of the American Chemical Society. J. D. Purcell, the new assistant general manager, has represented the company in the railroad department for five years. R. R. Browning, assistant treasurer, has held a similar position for some years, having been with the company since 1896. A. E. Carpenter, superintendent, has had charge of the manufacturing department for many years, and is the oldest employe in the service of the Dearborn company. The preparations manufactured by the Dearborn company for the treatment of boiler waters, both in stationary and railroad service, are most generally used. The scientific methods originated by the company's laboratories of treating each water individually, as per requirements, after analysis, has made it possible for Dearborn preparations to give the highest efficiency with all classes of boiler feed supplies.

Power Specialty Company, 111 Broadway, New York, manufacturer of the Foster patent steam superheater, has secured among recent contracts the following, covering installation of this superheater in the boilers indicated: Home Electric Light & Steam Heating Company, Tyrone, Pa., 840 horsepower in Stirling boilers; Torresdale Filtration Plant, Philadelphia (second order), 900 horsepower in Heine boilers; Western Clock Manufacturing Company, La Salle, Ill. (second order), 300 horsepower in return tubular boilers; Bernheimer & Schwartz Brewing Company, New York, 1,900 horsepower in Heine boilers; Garden City Company, Garden City, L. I., 200 horsepower in return tubular boilers; National Sugar Refining Company, Yonkers, N. Y., 1,134 horsepower in Babcock & Wilcox boilers. It has also sold Foster superheaters of the independently fired type to the New Jersey Zinc Company, University of West Virginia, Abendroth & Root Manufacturing Company and the Seacoast Canning Company. This latter company has within the past year equipped seven of its plants with the Foster superheater, installed in return tubular type of boilers.

ADVERTISING LITERATURE.

Railway Specialty & Supply Company, Chicago, Ill.—Bulletin S-211 illustrates and describes pin and block "Rapid" wire joints, which are especially adapted to signal work.

American Spiral Pipe Works, Chicago, Ill.—A new catalogue is devoted to spiral riveted pipe, forged steel pipe flanges and hydraulic and exhaust steam supplies. A large number of illustrations are used effectively.

Boston Gear Works, Norfolk Downs, Mass.—Catalogue El, recently issued, contains quite complete information about standard gears, also chains, sprockets, bearings, steering devices, etc. Many valuable tables are included.

Trussed Concrete Steel Company, Detroit, Mich.—A calendar is being mailed to architects, contractors and engineers on which is printed a table of properties of rib metal which will prove of value to the trade. A section of the ribbed metal is fastened to the face of the calendar.

Northwestern Expanded Metal Company, 930-950 Old Colony Building, Chicago.—Booklet No. 26, recently issued, entitled "Theory and Tests of Reinforced Concrete Beams," explains the theory of beam stresses in concrete by dealing separately with the tension flange, the compression flange and the web and describes tests made on beams provided with web reinforcement. Beginning with the knowledge that web stresses are present in a concrete beam similar to those in a steel beam or girder, it is shown that to secure an entirely satisfactory reinforcement, provision must be made for these tensile, compressive and shearing stresses in the web. The booklet further explains the system devised for reinforcing in every diagonal direction against these web stresses and gives results of actual tests made.

CATENARY CONSTRUCTION AND BONDS ON THE OREGON ELECTRIC RAILWAY.

The Oregon Electric Railway has now been completed between Portland and Salem, Ore., a distance of 50 miles. The road is constructed in a very substantial manner. A considerable number of cuts and fills were required to obtain the uniform grade of 2.65 per cent out of Portland, through the difficult country immediately adjacent. The road crosses the Willamette river on a 4-span steel bridge, each span being 200 feet long. With its trestle approaches this bridge has a total length of 3,800 feet. South of the Willamette river there is an 18-mile tangent, nearly level. The track structure consists of 70-pound T-rails laid on gravel ballast. All water courses are crossed on pile trestles, making ample provision for the heavy flows of surface water experienced in this region.

Power is purchased from the Portland Railway Light & Power Company and delivered at Oregon City over a 9-mile transmission line connecting with the railway. There are four substations on the railway, each equipped with a 500-kilowatt rotary converter. The transmission line carries current at 33,000 volts pressure and at a frequency of 33 cycles. The trolley voltage is 600.

Eight 60-foot motor cars with four 75-horsepower General Electric motors each, and two General Electric locomotives

Oregon Electric Railway—Overhead Construction on Curve.

with four 160-horsepower motors each, constitute the present rolling stock equipment.

Overhead Construction.

It was required that the overhead construction should be of as high a standard as the roadway and track, the materials should be of the best quality, the design good and all the parts strong enough to stand operation of heavy trains at high speeds. The Ohio Brass Company's catenary was selected to fulfill these severe conditions. All the fittings of this manufacture are of steel, reinforced by galvanized malleable castings.

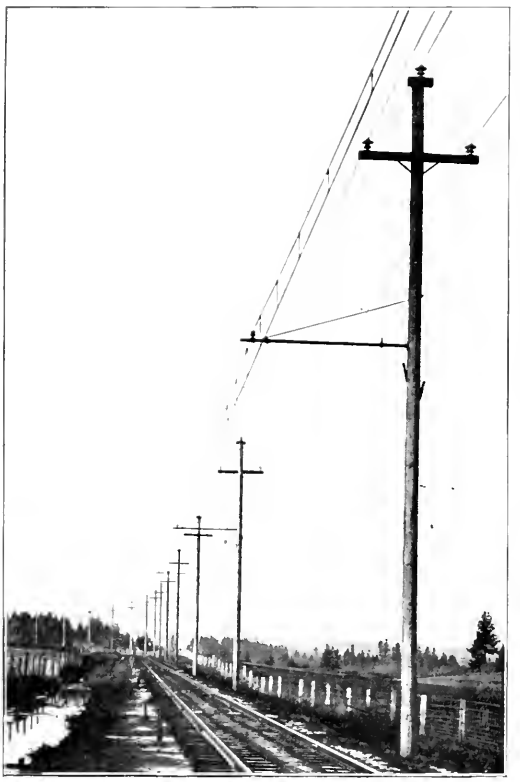
Catenary construction was used to support the trolley wire, as the actual expense would then be but little more than for ordinary direct-current overhead construction. This fact is at once apparent. Fewer poles and brackets are required for the 150-foot spans than for the 100 to 115 foot spans used in ordinary construction. The 3-wire transmission line of No. 2 aluminum is strung on the same poles that support the trolley line, 2-part insulators being used.

Bracket construction is used principally for carrying the overhead, but a small number of cross spans were also found necessary. The brackets consist of a steel T-bar supported by a 5/8-inch steel rod. The T-bar rests in a malleable socket casting fastened to the pole with lag screws, and the supporting rod is attached to an adjustably mounted malleable casting near the outer end of the bracket arm. A porcelain in-

sulator for supporting the catenary cable is mounted on a malleable iron pin, which slips over the T-bar.

A $\frac{5}{16}$-inch high-strength steel messenger cable supports the No. 0000 grooved trolley wire, with hangers spaced 10 feet apart. Each hanger consists of a $\frac{1}{2}$-inch steel bolt, which is screwed into a 5-inch trolley clip at one end, and into a messenger clip at the other. All the parts are galvanized.

For guying on curves a porcelain strain insulator is fastened to the pole by two $\frac{5}{8}$-inch eyebolts. From the insulator a $\frac{1}{4}$-inch stranded steel cable extends to two loops or bridles attached to the two nearest catenary hangers. All poles on curves are guyed, and, where necessary, guy stubs are employed. The porcelain strain insulators for holding the curve are then placed either on the line poles or on the guy stubs, depending on which are on the outside of the curve. This construction obviates the use of compression members in any part of the catenary—a very desirable feature in a high-speed interurban road.



Oregon Electric Railway—Overhead Construction on Tangent.

The accompanying illustrations, showing the details of overhead construction on curves and tangents, were made from photographs taken before the ballast was placed on the roadbed.

Track Bonding.

The bonds used on the new road are Ohio Brass Company's type "G-D," sold through Pierson, Roeding & Co., Pacific coast agents. These are soldered to the ball of the rail. This bond is made of a continuous copper strip wound in a flat coil at the ends and formed so as to have a wedge-shaped terminal at each end. The completed bond is of the general shape of the letter "U." The terminals are formed with small ridges on the surface which is applied to the rail. These ridges hold the bond away from the rail slightly, so as to form a pocket for the solder.

An item of interest in connection with the bonding work was the method of testing the bonds immediately after installation, and as soon as the rail had cooled. A steel bar 48 inches long was made with two hooks hung from a bolt through the bar, one inch from its end. These hooks were so designed that they would fit under the lower edge of the bond terminal. With this device a leverage of 48 to 1 was obtained on the broad under surface of the bond terminal, so that the foreman of the bonding gang, with an ordinary single-handed pull, could bring the shearing stress on the soldered surface to approximately 1,500 pounds per square inch. If the bond stood this shearing stress a satisfactory union between the bond and the head of the steel rail was assumed. The bond terminal, when well soldered, should fail at a shearing stress of approximately 3,000 pounds per square inch.

One of the important advantages of the "G-D" bond was exemplified during construction work, i. e., the safety of this bond against ordinary derailments, even where the bolt heads had been sheared off. The car, heavily loaded, was derailed and sheared off the bolts on about 10 angle plates, but the bonds were hardly touched. The angle plates had thrown the wheels far enough away from the bonds so that the beveled edge of the bond presented no direct bearing surface for the wheel, and the bond was consequently not stripped off, only the base of the contact area being slightly marked.

During the installation of these bonds under favorable weather conditions, 14 men were able to put on from 300 to 325 bonds a day when fully supplied with material and not subject to delays.

The "G-D" bonds above described were applied during the construction period. Frequent steam construction trains were operated, and the condition of the wheels on the construction cars was bad, as is usual in such cases. No trouble with the bonds was experienced. The wedge-shaped terminals exposed so little surface on top that guttered or flat wheels would not touch them.

In addition to 16,000 "G-D" bonds placed on this road, 450 of the Ohio Brass Company's type "G-F" Form 3 bonds were used in city streets. This is the ordinary type of soldered bond placed under the fishplates.

The construction of the road was in the hands of the Willamette Construction Company, a construction organization of W. S. Barstow & Co., New York. R. L. Donald was chief engineer in charge and F. S. Drake superintendent of construction.

SOLENOIDS AND MAGNETS FOR SPECIAL USES.

In electric railway work there are many automatic and labor-saving devices. Quite a number of these are, or might well be, controlled electrically. Frequently various switches, regulators, dampers and similar devices are made in local shops and for their operation electrical circuits are wired so that the apparatus may be remotely controlled. It is not uncommon that electro-magnets are used for the distant means of control when solenoids would answer the purpose much better and be cheaper to install. It is also true that both magnets and solenoids would doubtless be used to a greater extent in home-made devices if it were feasible to properly construct them so that they would perform their duties more reliably. Frequently when a solenoid for a special duty is needed there is no engineer available to immediately make the calculations as to the necessary length and diameter required and the amount and kind of wire to be used, so that the coil will perform its exact duty and neither overheat nor waste power.

The usual method followed in building such a coil is to design it by guesswork and it may be said that nine times out of ten the resulting solenoid will not exactly meet the conditions. It probably is found that although the solenoid and plunger have sufficient travel and lift, they will become useless from overheating, due to the unfamiliarity of the designer with this class of work.

Solenoids and magnets can be constructed by rule and their characteristics determined exactly. Such coils can be built to do the required work without the assistance of levers, cogs, etc., so that the power can be exerted direct. Frequently a well-designed coil will in this manner do away with many small mechanical parts otherwise found necessary. The mechanic or inventor who may be desirous of using a quick operated electrical device remotely controlled will find a valuable assistant in the solenoid or magnet which his ability may not warrant him in attempting to construct.

The Porter Manufacturing Company, 29 Griswold street, Detroit, Mich., is a specialist in the construction of solenoid and magnet coils. This company builds the coils according to definite specifications and is ready to guarantee that the finished coil will be the minimum size to perform the work required with the stated current and pressure.

The specifications necessary to be given when solenoids are to be designed follow: 1. Maximum and minimum voltage of current to be used. 2. Travel of the armature or plunger. 3. Pull to be exerted. 4. Maximum time the current is to be

fed to the coils. 5. Intervening time between operation of the coils. These are simple specifications that anyone desiring a coil can easily determine and it is said that with these few characteristics at hand solenoids and magnets can be designed for a variety of purposes not generally known.

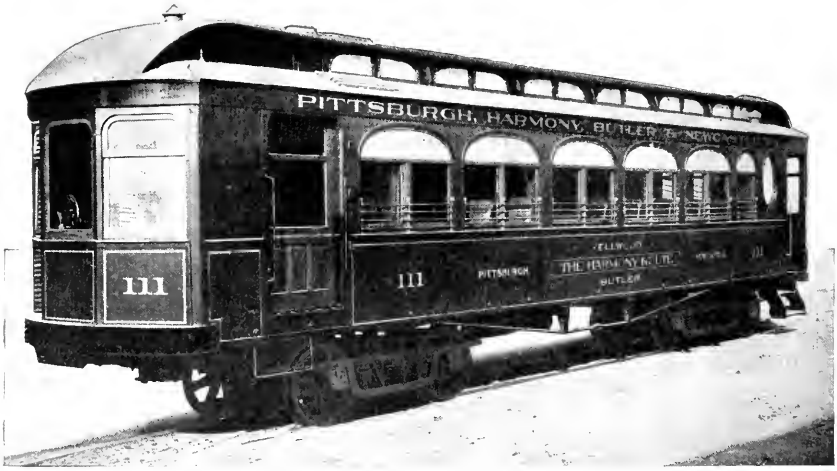
NEW CARS FOR THE PITTSBURG HARMONY BUTLER & NEW CASTLE RAILWAY.

The Pittsburg Harmony Butler & New Castle Railway of Pittsburg, Pa., which now has under construction a line to connect the cities named in the title, has recently received from the St. Louis Car Company 12 single-end combination passenger, smoking and baggage compartment cars, one of which is illustrated in the accompanying halftone engraving.

Some of the principal dimensions are as follows:

Total length, 46 feet; rear platform, 4 feet 5 inches; main passenger compartment, 22 feet 9½ inches; smoking compartment, 7 feet 8½ inches; baggage compartment, 10 feet 4 inches, including motorman's cab.

The cars are of the St. Louis Car Company's semi-steel frame construction. The side sills are composed of 5 by 8 inch yellow pine, reinforced with 6 by 8 inch channels, the center sills of 6-inch I-beams, weighing 12¼ pounds per foot, with yellow pine fillers. The intermediate sills are of yellow pine, 4½ by 6 inches; the end sills are of 6 by 8 inch oak, and the platform sills, of which there are four at the rear end, are of 3¼ by 8 inch oak, reinforced by 6 by 1 inch plates, extending from the bumpers through the bolsters. The bolsters are of the trussed type, made of ¾ by 10 inch and 1 by 10 inch steel plates. All sills extend through from the end sill at the rear to the bumper at the front end, there being only a drop at the rear end.



New Car for the Pittsburg Harmony Butler & New Castle Railway.

The sides are constructed with 12 window sashes and one baggage door. The lower sashes are arranged to raise, while the upper sashes are of Gothic design and are stationary, extending over the two lower sashes. The side sashes are glazed with plate glass and the upper and deck sashes with opalescent glass.

In the regular passenger compartment are 15 St. Louis Car Company's stationary seats, upholstered in brown plush with high head roll. The saloon is located in the rear of this compartment. A water cooler is set in an alcove from the outside. The side walls of the saloon are covered with mettile up to the window capping. The smoking compartment has six stationary seats, upholstered in dark green leather. The baggage compartment has three folding seats to be used when there is no baggage to be cared for. Parcel racks are placed in the main and smoking compartments.

An iron pipe railing separates the motorman's cab from the baggage compartment. A hot water heater is placed on the left side of the motorman.

The interior finish of the main compartment is mahogany with inlaid marquetry decoration. The ceilings are semi-empire, finished in pea green, with gold ornamentations.

Illuminated signs, vertical brake wheels and self-releasing brake handles, all furnished by the St. Louis Car Company, are included in the equipment, and the cars are mounted on high-speed trucks, with air brakes and air sanders.

NEW WESTON INSTRUMENTS.

The Weston Electrical Instrument Company, Newark, N. J., has recently developed and perfected a number of new measuring instruments. Among these are two new lines intended for use as ammeters and voltmeters on direct-current switchboards, designated as the Eclipse. These are of the soft iron or electro-magnetic type, and were given the name Eclipse to avoid confusing them with the Weston permanent magnet switchboard instruments. The features to which attention is especially directed are the absence of working error, chamber error and magnetic lag.

Other new lines are the Model 151 voltmeter and Model 156 ammeter for alternating-current switchboards. The claims made for these instruments are that they have no inductance error, no discernible working error, no chamber error, that they are entirely dead-beat and have remarkably uniform scales.

New portable alternating-current voltmeters and ammeters are designated as Model 155. The voltmeters for potentials up to and including 300 volts are 7 by 7½ by 3¼ inches. Those for higher potentials up to 750 volts are 7⅞ by 8¾ by 3¼ inches. The ammeters and mil-ammeters have the same dimensions as the smaller size of voltmeter. The portable ammeters include instruments adapted to give a full scale deflection with one ampere and instruments adapted to give full scale deflection with 300 amperes. They may be used on alternating circuits having a potential difference not greater than 2,300 volts; above this current transformers must be used. The same claims for accuracy are made for portable instruments as for the others to which reference has been made.

Another new instrument is a wire chief's voltmeter intended for use in telephone exchanges. A specialty for use in switchboard work is the new design of Weston swinging bracket, which is composed of three main parts—a bracket plate to be bolted to the angle iron frame or face of the switchboard; a swinging arm which is supplied in lengths of 15 or 24 inches, according to conditions, and one of a series of sliding adapters which vary in shape and size to conform to the dimensions of the instrument to be attached.

The Boston Elevated Railway will begin construction of the terminal station for its new Forest Hills elevated extension, in Forest Hills square, about the middle of March. Steel for this work has been ordered and is on the way to Boston. The station was approved a number of weeks ago by the railroad commission as a temporary affair, because plans for connection with the Boston & Providence Interurban Electric Railroad at or near this point have not yet become sufficiently definite to allow the permanent form of terminal to be fixed. Alteration of the present Dudley street terminal by adding platforms and rearranging tracks to allow way stops at that point by through Forest Hills trains, will be taken up a few weeks later. The station at Eggleston square, a way station on the extension, is about the only other large piece of construction yet to be taken up on this new line. The main structure and track are already completed from Dudley street to the edge of Forest Hills square.

The Georgia Railway & Electric Company has announced that work will be started this summer on its proposed extension to Buckhead, Ga.

ST. LOUIS CAR CO.
ST. LOUIS-MO.

ILLUSTRATED herewith is one of twelve single-end combination passenger, smoking and baggage compartment cars for the Pittsburgh, Harmony, Butler and Newcastle Railway.

These cars are of the St. Louis Car Company's semi-steel frame construction. Principal dimensions: total length, 46 feet; rear platform, 4 feet 5 inches; main passenger compartment, 22 feet 9½ inches; smoking compartment, 7 feet 8½ inches; baggage compartment, 10 feet 4 inches, including motorman's cab.

The sides are constructed with 12 window sashes and one baggage door. The lower sashes are arranged to raise, while the upper sashes are stationary. The side sashes are glazed with plate glass and the upper and deck sashes with opalescent glass.

The passenger compartment has 15 St. Louis Car Company's stationary seats, upholstered in brown plush with high head roll. In the rear of this compartment is a saloon, the side walls of which are covered with metal up to the window capping. The smoking compartment has six stationary seats, upholstered in dark green leather. The baggage compartment has three folding seats to be used when there is no baggage.

The motorman's cab is separated from the baggage compartment by an iron pipe railing. In the cab is a hot water heater on the left side of the motorman.

The cars are equipped with St. Louis Car Company's illuminated signs on the front of cars, vertical brake wheels on the front end and St. Louis Car Company's self-releasing brake handles on the rear end. They are mounted on high-speed trucks with air brakes and air sanders.

How to Use Advertising Space

ONE-HALF PAGE of space in the Electric Railway Review measures 5 1/16 by 7 1/8 inches —the exact size of this panel—or it may be used in a space 3 1/2 by 10 1/4 inches.

Half pages are ample for advertising many lines of business and will carry strong, attractive advertisements. The cost of such space for one year (52 issues) is $875.

Aside from running a half page of either shape every week, there are other ways of using the space to advantage:

Plan No. 1

Use 2 pages in some one issue, either as the first gun in your campaign, or at a time (such as before conventions) when you have something special to say. Then use 11 full pages—one in each of the other months; also 12 half pages—one each month. Quarter-page advertisements would complete the remaining 28 insertions.

Plan No. 2

Use 8 full pages and 28 half pages (36 issues), which would give you three advertisements of this kind each month. You could lead off with full pages, or you could bunch them at convention time, or at any other season when most valuable to you. Quarter-page advertisements would make up the remaining 16 insertions.

Copy should be changed each insertion, and we will help you do it. You buy the space and our Advertisers' Copy Service (free to all advertisers) will co-operate in the preparation of real advertising, the kind that helps sell goods.

If you do not like either plan, tell us your objections and we will make another.

Electric Railway Review 160 Harrison St. Chicago

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

An experienced business getter and manager would like to secure position as traffic manager for large electric system. Highest references. Address "No. 548," care of Electric Railway Review, Chicago.

Position as auditor wanted by a young man of experience in street railway and electric light accounting. Best of references as to character and ability. Address "No. 545," care Electric Railway Review, Chicago.

Position as auditor or assistant wanted by a young single man. Thoroughly experienced in railway, gas and lighting accounting. Now employed. Address "No. 544," care of Electric Railway Review, Chicago.

Expert armature winder on all types of G.E. and Westinghouse motors is open for a position. Live, up-to-date man, capable of handling men. Excellent habits. A-1 references. Address "No. 552," care of Electric Railway Review, Chicago.

Position by draftsman; have had nine years' experience in electric railway work, instrument work, mechanical and electrical drafting. Experience assistant to master mechanic and inspector of car construction, equipment and maintenance; track work and buildings. Also familiar with operation. Thoroughly reliable. Address "No. 549," care of Electric Railway Review, Chicago.

Mechanical and electrical engineer, 14 years' experience. Experienced in power station design and for 14 months acting superintendent of power stations on one of the largest street railway systems in America. At liberty April 1. Desires superintendent of power or similar position. Would open office in Boston as New England representative of responsible manufacturer. Address "No. 546," care Electric Railway Review, Chicago.

POSITIONS WANTED.

Experienced master mechanic desires position. Has thorough knowledge of high-speed electric railway equipment, on third rail or trolley. Is good executive, tactful and able to organize work of departments. Best of references furnished. Will consider position with high-speed interurban or city railway. Address "No. 550," care Electric Railway Review, Chicago.

Position wanted—The manager of a large railway, lighting and gas plant must make a change in his position owing to an unfavorable climate. Has held managerial positions for 10 years and is thoroughly familiar with the construction, organization and operation of electric railways. Correspondence solicited. Exceptional references. Address "No. 539," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Wanted — Electrical salesman who is selling to street railways to take important side line. J. W. Morrison, 29 Griswold street, Detroit, Mich.

Salesmen with technical knowledge, machinery and electrical installation, also auditors and accountants. Salaries $1,200 to $6,000. Ambitious men write us. HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

MISCELLANEOUS WANTS.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copy of the Electric Railway Review of January 12, 1907, in good condition. State price in your answer. Address "No. 536," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

Wanted—Copy of the Street Railway Review of August, 1903 (Vol. XIII), also complete sets of Vols. X and XI (1900 and 1901). State price, condition and whether latter two volumes are bound or unbound. Address "Street," care of Electric Railway Review, Chicago.

Copies of the Street Railway Review of January and February, 1906, are wanted. Name condition and price. Address "No. 535," care of Electric Railway Review, Chicago.

Copies of the Street Railway Review of March and April, 1904, in good condition for binding are wanted. State price sent postpaid. Address "No. 543," care Electric Railway Review, Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

Ask us about any book on electric railway and allied subjects. We publish some and sell all that are in print. The Wilson Company, 160 Harrison Street, Chicago.

If interested in any phase of steam transportation, you will find every development covered fully and accurately in The Railway Age. It is the leader and acknowledged authority in this field. Ask for free sample copies. The Railway Age, 160 Harrison Street, Chicago.

A copy of "The Motorman and His Duties," the standard handbook on the theory and practice of electric car operation, is worth many times its cost to every man interested in the subject. Send for 16-page pamphlet of sample pages. The Wilson Company, 160 Harrison Street, Chicago.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts expunged from, and the parts added to, the interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

A New Road with a Future.

The new 50-mile interurban line of the Oregon Electric Railway Company, which has just been completed between Portland and Salem, Ore., appears to have every opportunity for a most successful future. From the illustrations accompanying the description of the new road on another page of this issue, it will be noted that the construction is of an especially substantial nature throughout. As the road is to be operated in direct competition with an important steam railroad, which it closely parallels for the entire distance, its success depends on its possessing all the advantages of the steam road, together with the additional benefits, such as low rates and frequent service, which are incident to the electric railway. The Oregon Electric Railway has therefore been constructed and is operated according to steam railroad practice under the management of men whose experience has been in that field of transportation. Although the population between terminals is only that of a thickly settled agricultural community, the fact that the road connects the capital and the metropolis of the state seems to assure a good passenger traffic from the start, especially in view of the fact that the competing steam service is inadequate, and the opportunities for developing a large freight business in such a productive region as the Willamette valley seem almost unlimited.

Car Design and Traffic Capacity.

Mr. Arnold's report to the public service commission at New York recommending the use of additional side doors on the Interborough subway cars illustrates in a most convincing way the immense importance of studying the relations between car design and carrying capacity. If the estimate is correct that the average express train stop in the subway can be cut from 55 to 30 seconds, it is clear that here will be a great saving in time ordinarily wasted. It has been shown repeatedly that the best powers of expensive equipment—motors of great capacity, quick-acting brakes and carefully designed and adjusted automatic multiple-unit control—cannot be utilized properly in maintaining a high schedule speed unless the length of station stops is short. The root of the whole trouble of service delays and overcrowding on city lines where train service handles the traffic is this problem of stops. Given the extra side doors, the pay-as-you-enter features of progressive movement in the subway car and smooth approaching and departing movements on the platforms ought to be readily secured. It practically is impossible to keep clear the platforms of cars without side doors, as passengers can always offer the excuse that they intend to leave at the next station. By putting in end side doors, however, there is no question that the entering platforms would be much freer, in many cases clear, since passengers will pass rapidly into the empty car vestibule and can move at once into the space which has been made vacant by the leaving passengers. In dealing with traffic problems of this character the most apparently trivial conditions are liable to assume great importance. A small feature which affects one passenger favorably or adversely carries large weight when multiplied by many thousands of repetitive occurrences per day. Neither car nor station design can be separately considered. Control of the traffic both inside and outside the car may perhaps never be ideally perfect, but there is room for a great deal of further study along hopeful lines.

Uniformity in Rules in Indiana.

The conference between the members of the Railroad Commission of Indiana and the operating officials of electric railways within that state on February 18 was not called in response to any great public outcry against corporate management. If it had been arranged as a sequel to a senseless cry against the railways, there would not be the promise of fruitful results from co-operation which now exists. As the report of the meeting in last week's issue of the Electric Railway Review indicated, the commission had ascertained, primarily, the complete absence of uniformity in operating rules of the different roads in the state. Its knowledge had been gathered largely by inspectors who were trained in railway service, the chief of whom, Mr. Shane, commendably stated that the railways were entitled to benefit from the experience of employes who received their valuable training and education while in the railway service. It is right that rules, the simpler the better, should be framed for the government of employes, and the committees have a serious task before them to recommend practices which will be adaptable to the varying needs of all the roads in the state. But a good start has been made, and when the reports of the committees are presented and adopted by the roads of the state, their effect should be, if employes are obedient, to lessen the risk of accidents and eliminate the chance that some day, through a combination of unfortunate developments, court proceedings will take place that would be a source of eternal regret.

Limitations of Electric Power.

While the manifest advantages of electricity as a motive power and the economy of propelling a large number of units by power generated at a central station are universally recognized, it is easy to lose sight of the occasional drawbacks inherent in this method of propulsion. This fact is well brought out in a recent editorial in The Chicago Daily Tribune in commenting upon two recent accidents on important electric railroads in which traffic was entirely suspended for a considerable period of time, in each case as the result of a trifling mishap. In the first case, on a Chicago elevated road, one of the main feeder cables supplying a section of the main line became grounded during a storm through a cracked insulator and traffic over some two miles of line was tied up for about two hours until the source of the trouble could be located and the defect repaired. In the second case, in the New York subway, a stray bit of iron caused a short circuit from the third rail to the track rail, keeping the passengers in fear and in darkness and the trains at a standstill on a large section of the road for over an hour. Such incidents not only indicate the necessity for the most vigilant inspection on electric roads in order to insure uninterrupted service, but they should also increase our admiration for those who have so successfully harnessed such a difficult form of energy to handle as electricity and made it serve their

purposes, to the everlasting benefit of humanity. As the Tribune expresses it: "These things being considered, the wonder is that the electrically operated roads have so few accidents of the sort rather than that an occasional delay comes to disturb schedules.

Street Traffic Congestion in Boston.

The recent report of the Boston transit commission upon the subject of traffic congestion in the streets is of interest to electric railways operating in cities handicapped by the lack of wide thoroughfares. The narrow and crooked streets in Boston are constantly a great handicap to the handling of surface traffic by the Boston Elevated Railway. The report charges practically all the congestion on the streets to blocking by teams. The removal of certain cars from the streets upon the completion of the underground routes will tend to reduce congestion, but if the vehicular traffic is properly handled there is little doubt that the whole situation will be vastly improved. The transit commission urges the prompt removal of snow; the separation on certain routes of heavy and light teaming traffic; the restriction of curb markets and push carts; the relocation of certain express offices on broad streets not traversed by electric cars; denial of permits for stands of teams and carriages on congested streets; restriction of hours of deliveriug coal and ice, collecting refuse, etc.; regulation of the movement and stopping of slow and fast vehicular travel on narrow streets, and the confinement of traffic on certain streets to one direction of motion. The benefits of freer movement inside the congested district of a city are far-reaching, for the result is a stimulation of travel all along the line, both for short riding and between suburban points and the business center.

INCREASES IN FARES.

The movements to increase rates of fare on various urban and interurban electric railways are born of necessity. Many incidental causes of such movements will appear, but none is more important in its bearing on the industry as a whole than the failure to appreciate that maintenance charges, although light in the earliest years of an expanding electric railway system, are certain to become an insistent and necessary factor in operating expenses, and that the lapse of franchises must be reckoned with.

The most recent general movement for advances in fares has taken place in Massachusetts, where, with indeterminate franchises and strict laws governing the issue of securities, there has been a deplorable failure to realize profits from investments in street railways. The unit of fare on the Lexington & Boston Street Railway was increased from five to six cents on February 1, 1908. This company operates 32 miles of track and connects Waltham, Lexington, Concord, Billerica, Arlington, Bedford and Wolburn. The Blue Hill Street Railway, which operates 19.6 miles of track from a connection with the Boston Elevated Railway at Mattapan through Canton to Stoughton, increased its rate of fare from five to six cents on January 5 last. Stone & Webster, general managers of this road, state (Electric Railway Review of February 22, 1908, page 237) that as a result of this change the gross earnings have increased so far 8 to 10 per cent, while in view of other conditions a decrease would naturally be expected. The Taunton & Pawtucket Street Railway has also increased its rates.

In its application the theory that the rate is what the traffic will bear relates more to freight rates than to passenger rates, and to steam railways more than to electric railways. The urban street railway fare is usually set at not over five cents for a single ride. This amount has been arbitrarily fixed in strange disregard of any principles and without relation to the length of haul, density of traffic or term of franchise, but it is not more inconsistent than the rates established with the opening of many interurban railways. A rate of one cent per mile on an interurban road, for instance, must be admittedly inadequate or adequate in the beginning. If the rate is presumed to be inadequate it presupposes either (1) increase in the density of traffic to a point which will make such a rate profitable or (2) advances in rates when traffic has been drawn from competitive sources and the territory has been built up. If such a rate was permitted because the management of the property did not appreciate that the true cost of operating would include heavy charges under maintenance for renewals and replacements, the result would be unfortunate alike for the owners, creditors and passengers of the railway. If the management advertised rates that were known to be inadequate while the purchase of a right of way was in process of negotiation, there would be great risk of the establishment of such rates as the consideration for limited-term franchises granted by municipalities. Such franchise-bound rates would thereafter be the maximum gross revenue possible on parts of the system, although there might be flexibility coucerning rates on other parts of lines. Where rates are inadequate at the commencement of operation and an anticipated density of traffic fails to materialize, increases must be made when they are lawful unless the enterprise is to fail. Resort is not infrequently had to advances in rates because of unexpected traffic poverty of the section traversed, but increases are sometimes made in pursuance of a policy, framed in advance, to establish low rates and leave them in force while the territory is undergoing a certain measure of development, the plan being to increase rates later. Such a policy is unwise for the reason that it antagonizes the public and may lead to permanent bad feeling.

The attitude and the decisions of the Massachusetts railroad commission on the subject of fares have not been hostile to the railways. In its thirty-ninth annual report, covering the year ended June 30, 1907, the commission states that "among the smaller companies, especially those serving sparsely settled communities, the period has arrived when considerable sums of money must be spent for repairs and renewals. Many have been unable to earn a sufficient sum above their operating expenses and fixed charges to place them in the dividend paying class and the problem in operation will be not only that of paying dividends, but of making renewals of track and replacements of rolling stock without impairment of capital." The commission also mentions the essential connection between an adequate service and a fair return upon money invested and suggests to the companies the wisdom of proper provision in the present for the inevitable needs of the future. Recent decisions of the commission respecting changes in fares are consistent with its policy as here set forth. In a decision rendered on April 27, 1906, concerning the action of the Boston & Northern Street Railway Company, which had increased the cash fare between Melrose Highlands and Boston from 5 to 10 cents, at the same time placing on sale 10-trip tickets for 75 cents, the commission held that no railway "can carry passengers nine miles for five cents over an interurban railway constructed, maintained and operated like this, and at the same time out of earnings pay * * * a fair return upon investment."

To consider only the cost of operation—i. e., conducting transportation and general expense—disregarding the inevitable expense of maintenance of way and structures and equipment, is to invite disaster. From the moment of operation of an electric railway the property begins to depreciate, and provision for a loss which is undeniable should be made. If the operating expenses fail to make provision for the loss of capital investment which occurs with the passage of time, they do not accurately show the cost of furnishing the transportation service for which the company was organized and its investment made; and neither the owners of the property

nor the people in the communities served can be given an accurate statement of the true cost of providing the service. It follows that when such figures are used as the basis for determining rates, disappointment and disillusion must almost certainly result.

Some of the interurban railways in the central west are confronting the same problem of inadequate fares which has arisen in Massachusetts. It is possible that realization of the necessity for increases in fares would not have occurred at this time had it not been for the decline in traffic which is now reported by most lines.

If increases in passenger fares are inevitable there is no wiser time to announce them than now. The conditions of traffic and general business afford a justification for such a step, which should be appreciated by the public and any public commissions that assume jurisdiction over such matters.

ANNUAL REPORTS.

Chicago & Oak Park Elevated Railroad.

The deficit of the Chicago & Oak Park Elevated Railroad in the year ended June 30, 1907, after provision for taxes, interest and rentals, was $63,945. This amount is less than the deficit in any one of the three preceding years. The principal results of operation compare as follows:

Year ended June 30—	1907.	1906.	1905.
Gross earnings	$892,569	$890,554	$842,944
Operating expenses	527,180	505,538	505,929
Net earnings	$365,389	$385,016	$337,015
Interest, taxes, etc.	429,334	477,794	447,862
Deficit	$ 63,945	$ 92,778	$110,847
Operating expenses, per cent of gross earnings	59.07	56.77	60.02

The detailed statement presented to stockholders by Clarence A. Knight, the president, shows an increase in gross passenger earnings of $6,229 and a decrease in miscellaneous earnings of $4,214. The change in the latter item was due to a loss in the revenue from advertising, news and vending privileges and rentals from real estate. Mr. Knight attributes the small increase in passenger earnings to the electrification of the Madison street surface line of the Chicago Union Traction Company and introduction upon that line of modern cars, and also to the service afforded by modern cars on the Lake street surface line. Mr. Knight states:

Our passenger earnings have increased at the various stations beyond the 4-mile zone and show a decrease inside of that zone. That is, our passenger earnings increased from Fortieth street west, and decreased from Fortieth street east. Another factor which resulted in the loss of passengers was the removal of the plant of Sears, Roebuck & Co. from the line of this company. A loss of traffic may also be accounted for by the lack of facilities upon the Union loop. The loop company has been endeavoring to obtain an extension of the platforms of the loop stations and other improvements, which would greatly facilitate the movement of trains around the loop.

The cost of conducting transportation was $404,731, or 45.3 per cent of gross earnings, an increase of $13,088 over the previous year. The larger expenditure is due in part to a new wage arrangement with employes in the train service. The maintenance expenditures were as follows: Equipment, $50,550; way and structure, $21,405. Taxes were $47,973. The outstanding notes payable amounted on June 30, 1907, to $2,174,500. Interest charges increased $8,984 over the preceding year, largely as a result of the prevailing higher rates of interest.

The train mileage for the year ended June 30, 1907, was 1,678,239 miles, and for the preceding year it was 1,620,208 miles. The car mileage was 4,968,900 miles, and for the preceding year it was 4,868,240.

The management hopes during the coming year to extend the road through the territory lying west of Oak Park, believing that such an extension would add sufficient traffic to wipe out the annual deficit.

Louisville Railway Company.

Operating expenses and taxes of the Louisville (Ky.) Railway Company absorbed 66.3 per cent of gross earnings and other income in 1907, as compared with 60.3 per cent in the preceding year. In his report to the stockholders T. J. Minary, the president, states that while the results were affected by the strikes and general business situation, the results should be entirely satisfactory when compared with those of companies in other cities which have experienced similar troubles. The figures for three years compare as follows:

	1907.	1906.	1905.
Gross earnings and other income	$2,668,146	$2,592,996	$2,355,820
Operating expenses and taxes	1,767,948	1,563,311	1,422,952
Net earnings	$ 900,198	$1,029,682	$ 932,868
Charges	368,126	350,271	351,504
Net divisible income	$ 532,072	$ 679,411	$ 581,364
Preferred dividends	125,000	125,000	125,000
Balance	$ 407,072	$ 554,411	$ 456,364
Common dividends	371,738	471,706	376,707
Surplus	$ 35,334	$ 82,705	$ 79,657
Special appropriations	16,327	70,000	65,000
Surplus	$ 19,007	$ 12,705	$ 14,657

The gross earnings and other income in 1907 were derived from the following sources: From city passengers, $2,497,467; from interurban passengers, $128,126; other income, $42,553. Taxes amounted to $216,000. Mr. Minary mentioned several matters of interest to the shareholders. The company has acquired the franchise for a new double track which will be used by the Northern Indiana Traction Company for its entrance to the city. Fifty new cars were added to the equipment, and the car house and repair shops have been enlarged and improved.

A WARNING.

To the Editors:

The accompanying item, if published in your paper, will be of interest to all your railway patrons. Two crooks have worked this company and its friends for timetable advertisements. A number paid for the advertisements in advance.

All railroad officials should beware of the "Official Folder Timetable" man. His mission is to see you on important business. He offers to supply you for a year with timetables free of charge, you allowing him to advertise in the same. He agrees to pay you 15 per cent of the net receipts in consideration for a letter of introduction. He presents to you letters of introduction containing the signatures of prominent railway officials and you are to copy one of these letters. This letter seems very simple, but, by signing it, you make him your special representative. This letter is the "joker" and binds you to fulfill whatever agreements he sees fit to make. He collects cash for the advertisements from whomsoever he can and leaves his victims for you to satisfy.

It is the duty of someone to catch and punish these crooks.

THOMAS HAWKEN,
General Manager Rockland Thomaston & Camden Street Railway.

Rockland, Me., February 22, 1908.

The Duluth Street Railway Company has removed its general offices from the power house building to a new office building at the northeast corner of Twenty-seventh avenue west and Superior street. The office building has been in process of erection since early last fall. It is located on the corner of the block containing the car barn and the company's shops. The general offices have been maintained at the old power house ever since the company began the use of electricity for its motive power.

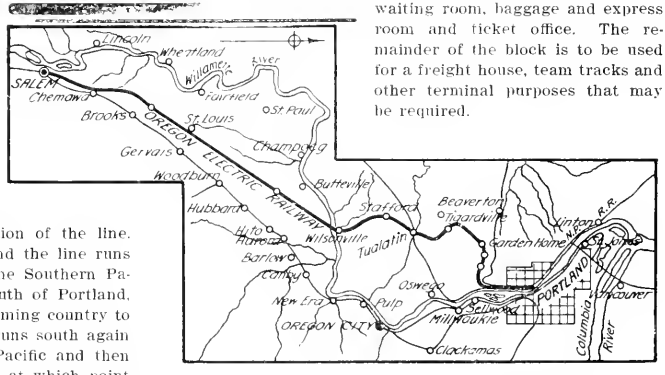
THE OREGON ELECTRIC RAILWAY.

On February 1 the Oregon Electric Railway Company opened for operation the first portion of its proposed system, an interurban line connecting the cities of Portland and Salem, Ore., a distance of 50.72 miles. The company was incorporated on May 15, 1906, under the laws of Oregon, absorbing at that time the Willamette Valley Traction Company, which held franchises covering part of the present right of way. The capital stock of the company is $10,000,000. During the next few months it is proposed to extend the line from Portland to Hillsboro and Forest Grove, 22 miles. An ultimate extension from Salem up the Willamette valley as far south as Eugene is also contemplated, which will make a total of 135 miles.

The accompanying map shows the location of the line. From the Jefferson street terminal in Portland the line runs almost directly south, paralleling a line of the Southern Pacific Company to a point about 2½ miles south of Portland, thence turning west through a magnificent farming country to Garden Home. From Garden Home the line runs south again to Tualatin, where it crosses the Southern Pacific and then continues through fertile land to Wilsonville, at which point it crosses the Willamette river on a steel bridge 110 feet above the low water line, thence making a tangent of 19½ miles through small forests and fertile farming country to a point near Chemawa, at which point it again turns south through Chemawa and toward Salem.

While the only intermediate towns of any size are Tualatin and Wilsonville, the entire section traversed is a thickly settled farming community and there will be numerous stations established at cross roads. Under the schedule which was put into effect at the time of the opening of the road there are 21 stations, including the terminals of Portland and Salem. In naming the new stations the management has selected names of Indian origin. Inasmuch as the Willamette valley occupies a prominent place in the early history of Oregon, especially in connection with the movements and traditions of the Indians, this idea will be carried out to a certain extent in the advertising of the road.

As the line ends for the present at Mill street in the city of Salem permanent terminal facilities at that point are being arranged for. At Jefferson street, Portland, the company owns an entire city block. On one corner of this block a building has been erected which contains six storerooms, a waiting room, baggage and express room and ticket office. The remainder of the block is to be used for a freight house, team tracks and other terminal purposes that may be required.



Oregon Electric Railway—Map of Present Line.

This new interurban line is the outcome of the steady growth of business and population in the Willamette valley, which is very fertile and produces great quantities of fruit, hops, grain and vegetables, besides forest products, etc. The demand for better passenger service between Portland and Salem was principally instrumental in bringing the road into existence. The service between these cities will be quicker, cheaper and more frequent than is at present maintained on the competing steam road, and it is expected that the electric company's equipment will be taxed to its capacity. Salem being the capital of the state and Portland the metropolis the daily traffic between the two places is quite heavy at all seasons, but especially so during the sessions of the legislature and at the time of the state fair at Salem. On one day

Oregon Electric Railway—Long Timber Trestle on Curve Near Portland, 100 Feet High.

Oregon Electric Railway—Steel Deck Bridge over the Willamette River at Wilsonville.

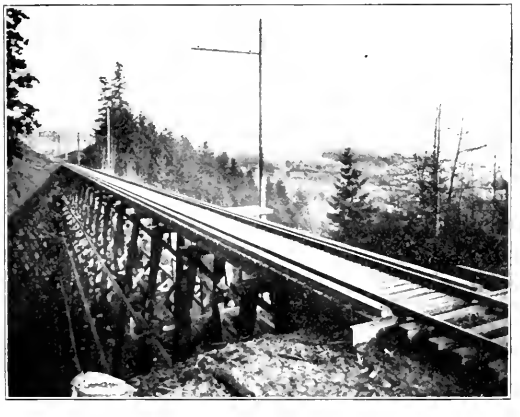
during state fair week last year the Southern Pacific Company was obliged to turn away over 2,000 passengers at Portland on account of lack of equipment and service.

Sources of Traffic.

For some time the Southern Pacific Company has been unable to take care of traffic offered in this district. Freight shippers have suffered because of the inability of the railroad company to furnish sufficient cars, or to move cars promptly. The passenger service has also been unsatisfactory by reason

Oregon Electric Railway—19½-Mile Tangent.

of the trains being habitually late and overcrowded, making the running time far behind the schedule between valley points and Portland. The Oregon Electric Railway will do much to relieve this situation at points served by both lines. The electric line crosses the Southern Pacific Company's west side line at Tualatin and runs parallel to the main line practically



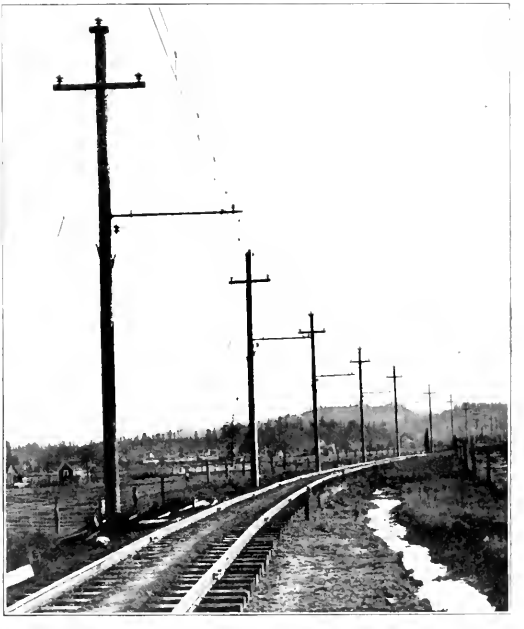
Oregon Electric Railway—Long Timber Trestle Near Portland.

the entire distance from Wilsonville to Salem at a distance of from one to four miles, so that it will be possible for most shippers in this territory to deliver their products or for passengers to travel via either line.

In the past much of the fruit crop of this region has been wasted on account of the inability of the farmers to get it to market, but with this new outlet this fruit can be easily and profitably marketed. It is also expected that there will be several canneries erected along this line to utilize the fruit which does not find a ready market. Already large farms along the line are being divided into 5 and 10 acre patches for truck gardening and fruit culture. Moreover, the onion raising industry is rapidly becoming an important factor in Willamette valley activity and there will be considerable business derived from this source all along the line. Hops are also grown extensively in this section and it will require considerable equipment to move them as well as to transport the pickers when the crop is ready to harvest.

The commodity which will probably require the greatest attention from the management will be cordwood. There are large tracts of woodland adjacent to the line where the timber is not heavy enough for logging but which can be profitably cut into cordwood and shipped to Portland, where there is a constant demand for it. One shipper alone offered 1,300 cars of this class of freight. One sawmill is already located on the line at Tualatin and there are good prospects of more in the near future.

Freight will be interchanged with steam roads at connecting points. Arrangements have been made with the United



Oregon Electric Railway—Transmission Bracket and Catenary Construction on Curve.

Railways Company in Portland for the handling of freight cars between the Jefferson street terminals of the Oregon Electric Railway and the North Portland terminals of the Northern Pacific Railway, Spokane Portland & Seattle Railway and the Harriman lines. As the United Railways Company's track runs directly through the wholesale district of Portland this will afford a splendid opportunity for the wholesale houses to ship direct to points in the Willamette valley. At present there are twelve 400-foot and two 600-foot spurs, also ten 400-foot and four 600-foot passing tracks for the accommodation of freight and the handling of passenger trains, besides the team tracks and terminal yards at Jefferson street, Portland, and the yards near Salem.

Aside from the advantages to be derived in the way of regular freight and passenger business the new road will add another facility for reaching the many points of interest around Portland. This city is already noted for the many enjoyable side trips which are at the disposal of its citizens and the many tourists which visit the northwest every year.

The snow covered peaks in the Cascade mountains can be seen from all parts of the valley on a clear day. The summit of the coast range of mountains can be seen on the west, while in between lies the broad fertile valley studded with farms and woodlands and intersected by sparkling streams which have their source in the perpetual snow of the mountains. An excellent view of Portland is obtained from the hill near South Portland and on clear days Mt. Hood, Mt. Adams, Mt. St. Helens and Mt. Rainier are in full view. An especially pleasing view is that looking down the Willamette river toward Mt. Hood from the Wilsonville bridge. The Oregon Electric Line traverses some of the most picturesque portions of this valley and makes it an easy matter for picnic parties to spend a day in the country.

Track and Roadway.

The track and roadbed have been constructed throughout in accordance with the highest standards of steam railroad practice. The small number of curves and grades and the substantial character of the bridges and trestles make it possible to operate with safety at a high rate of speed. The heaviest grade on the line is one of 2½ per cent over a hill just outside the city limits of Portland; none of the other grades exceeds 1 per cent. Including city streets there are only 50 curves and 85 per cent of the track, including a 19½-mile stretch south of Wilsonville, is on tangent. The sharpest curve is 8 degrees.

The track is standard gauge and is laid with 70-pound rails on fir ties. The bonds are of the Ohio Brass Company's "G-D" type. These were described in last week's issue of the Electric Railway Review, page 253. The track is now being ballasted with 2,300 cubic yards of gravel per mile. A large number of cuts and fills were required. The slope of the

Oregon Electric Railway—Standard Local Passenger Station.

embankment on fills is 1½ to 1 and in cuts 1 to 1. There are 38 pile trestles. At Wilsonville the road crosses the Willamette river on a steel bridge of four 200-foot spans, with a totol length, including trestle approaches, of 3,800 feet.

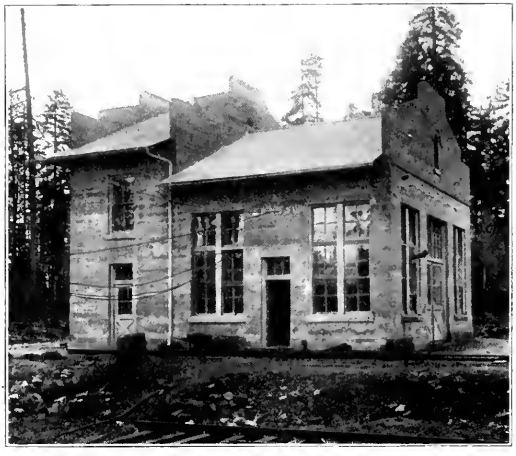
Power.

Power for the operation of the line is purchased from the Portland Railway Light & Power Company and transmitted from its power plant at Oregon City to the railway over a 9-mile transmission line, carrying current at 33,000 volts pressure and a frequency of 33 cycles. The current is converted to the operating pressure of 600 volts in four substations, equipped with 500-kilowatt six-phase 600-volt rotary converters and the necessary switchboards and transformers, all of General Electric manufacture. The substation buildings, one of which is illustrated herewith, are of concrete and are 36 by 42 feet in size.

The overhead construction is of the catenary type, the No. 0000 trolley wire being suspended from a $\frac{3}{16}$-inch galvanized steel messenger cable, supported by 9-foot 9-inch T-bar brackets from poles set 150 feet apart on tangent and 100 feet apart on curves. The poles also carry the transmission line and the telephone and telegraph wires. The overhead construction, which was supplied by the Ohio Brass Company, was completely described in last week's issue, page 253.

Rolling Stock.

The rolling stock equipment of the new road comprises eight passenger motor cars, two electric freight locomotives



Oregon Electric Railway—Standard Concrete Substation.

and 15 freight cars. An order has been placed for 25 flat cars and 25 box cars to supplement the other freight equipments. As shown by the accompanying illustrations, the passenger cars are large equipments of an especially pleasing design. These cars were built by the Jewett Car Company, Newark, O.

The length of the car from bumper to bumper is 57 feet 8 inches. The car body is 9 feet wide over posts and when mounted is 13 feet 7¼ inches high from rail to trolley board. The interior of the car is divided into three compartments: a baggage compartment with four folding seats, a smoking compartment with four fixed and four reversible seats and a general compartment with three fixed and 16 reversible seats. The toilet compartment occupies a corner next to the rear door. As the cars are arranged for single-end operation the motorman will be entirely shut off from the passengers. His cab is provided with a 24-inch door on one side only. The baggage compartment has two sliding side doors each 3 feet 6 inches wide. The doors in the interior partitions and in the rear bulkhead swing on hinges.

Each car body is mounted on Baldwin heavy M. C. B. type trucks with steel wheels and Symington journal boxes. Each car is equipped with M. C. B. coupler heads and one locomotive pilot. The electrical equipment of each car includes four 75-horsepower General Electric motors with multiple-unit control. The brake equipment is the Westinghouse Traction Brake Company's A M R schedule with quick-acting triple valve, quick recharge, quick service and graduated release features. A No. 3 direct-current air compressor and a slack adjuster are included in the brake equipment. The cars are equipped

with De France air sanders. The locomotives are double-ended, of 50 tons weight and are equipped with two 160-horsepower General Electric motors and pantagraph current collectors.

A 60 by 135 foot car house is located at South Portland and a smaller one at Salem.

Operation.

Trains are to be operated in accordance with the standard code of rules of the American Railway Association. All signals, markers, etc., will also conform to those in general use on steam roads. The dispatchers' office is located at Portland and standard telegraphic train orders will be used. A telephone line has also been provided for use as an auxiliary. The policy of the company is to insist on good and regular service. The dispatching system has been very carefully arranged and all trainmen who enter the service are required to pass a thorough examination in the rules of the American Railway Association besides a rigid physical examination.

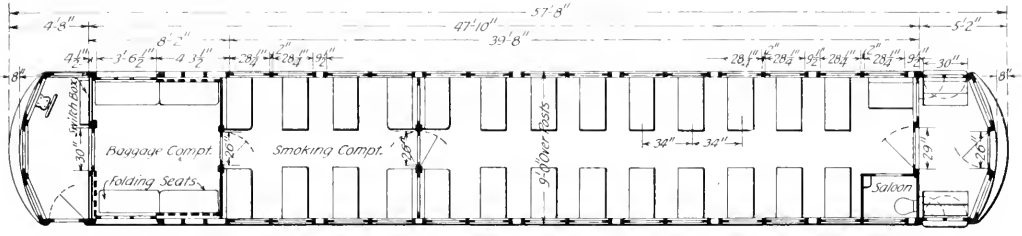
As soon as the ballasting is completed the company will establish a schedule of 10 trains per day in each direction between Portland and Salem. Three trains in each direction will be limited trains making no stops between terminals. It is expected to make the running time of the limiteds 1 hour and 30 minutes and of the locals 2 hours and 10 minutes. At present 1-car trains are used, but it is planned to eventually operate multiple-unit trains of two and three cars each.

Rates.

The local 1-way tickets will be sold on a basis of three cents per mile, or $1.50 for the entire distance, which, on account of the shorter mileage, is less than the Southern Pacific rate of $1.65. The round-trip rate between Portland and Salem is $2.75 and in general the round-trip rates are 5 per cent less than the sum of the 1-way fares. A 1,000-mile mileage ticket is issued at 2½ cents per mile and family commutation tickets are sold at 2 cents per mile. In addition there are reduced week-end rates and special rates for school children will be established.

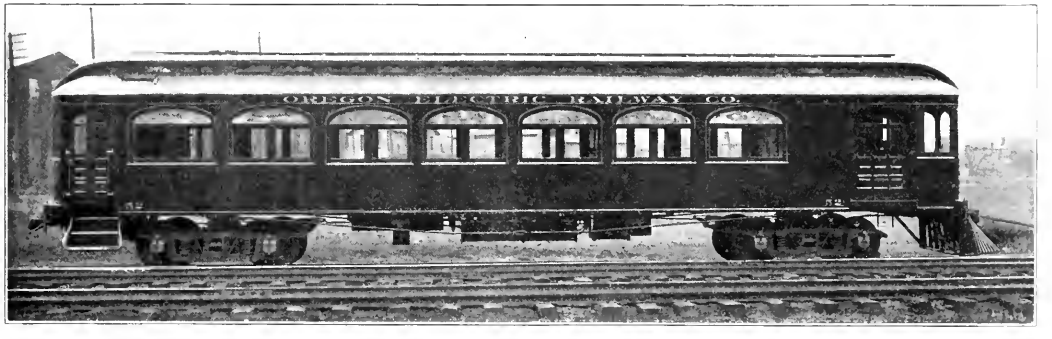
The construction of the road was in the hands of the Willamette Construction Company, a construction organization of the engineering firm of W. S. Barstow & Co. of New York and Portland. R. L. Donald was chief engineer in charge and F. S. Drake superintendent of construction.

The officers of the Oregon Electric Railway are: President, George Barclay Moffat, New York; vice-president and general manager, Guy W. Talbot, Portland; secretary, traffic manager and auditor, George F. Nevins, Portland; assistant secretary, Francis C. Schwab, New York; treasurer, Henry W. Brower, New York; assistant treasurer, C. H. Still, Portland; superintendent, C. A. Coolidge, Portland. The general offices of the company are located in the Corbett building on the corner of Fifth and Morrison streets, Portland.



Oregon Electric Railway—Floor Plan of 3-Compartment Passenger Car, Showing Seating Arrangement and Principal Dimensions.

The Illinois Traction System, which was recently ordered to build an elevated crossing over the tracks of the Illinois Central and Chicago & Alton railroads for the entrance to Lincoln, Ill., of its Lincoln-Mackinaw line, has secured permission to build a temporary line at grade so that passengers may enter the city without transferring to the city cars. It is stated that as soon as the temporary track is laid the company's sleeping cars from East St. Louis will be run through to Peoria instead of stopping at Springfield as at present.



Oregon Electric Railway—Single-End Passenger Car with Three Compartments.

The Seattle Electric Company is making practical tests of various kinds of fenders for the purpose of deciding upon the type which will minimize accidents. Tests have been conducted at the company's shops at Georgetown, Wash., and those which have given promise of proving satisfactory have been attached to cars.

THE NEW YORK SUBWAY CAR.

BY BION J. ARNOLD, CONSULTING ENGINEER, CHICAGO.

[This report on "The Subway Car" is a part of a general report on the present subway system of the Interborough Rapid Transit Company of New York. The report, presented here in abstract, is made for the public service commission of the first district, state of New York, to serve which Mr. Arnold has been retained in a consulting capacity. A preliminary report, including suggestions for facilitating traffic, was presented in the Electric Railway Review for December 7, 1907, page 892.—Eds.]

The Present Car.

That part of the subway which presumably is of the greatest interest to the traveling public is the design and operation of the car. The car equipment at the present time consists of 500 composite cars in which some wood is used, 300 all-metal, strictly fireproof cars, and 50 additional all-metal cars which have been ordered recently and are now being delivered, making a total of 850 cars. All of the cars are practically the same size, with seats and doors similarly arranged. Each car is 51 feet 2 inches over all in length and 8 feet 7 inches in width, and is provided with 52 seats, 16 of which are cross seats near the center of the car, with the other 36 seats placed longitudinally near the ends. The cars are as long as the curvature of the tracks will admit, and as wide at the top as the clearance on critical curves will allow. All the cars have closed vestibuled platforms, with sliding doors, instead of the usual gates. Figure 1 indicates the seating plan and the general dimensions of the car.

On account of the excessive use of the doors, the present type of car, which ordinarily gives satisfactory service, has proved to be extremely inadequate for the subway.

Since the opening of the tunnels to Borough hall, Brooklyn, on January 10, 1908, a schedule or timetable has been prepared calling for 40 express trains per hour between Ninety-sixth street and Brooklyn bridge during the rush periods. The delays of the trains at the station platforms, however, have seriously interfered with the carrying out of the improved schedule. As soon as the demand for seats increases beyond a certain limit the supply of seats begins to decrease.

The present arrangement of loading and unloading passengers through the same end doors of the cars is the chief cause for the inefficient operation during the rush-hour period. The unloading usually requires from 15 to 30 seconds, and in extreme cases 50 seconds during the most congested period at the principal points of transfer.

An analysis of the average time required by an express train at a station platform during the height of the rush hours shows the following figures:

	Average, seconds.
To open doors of cars after train has stopped	2
To unload an average of 163 passengers through 14 doors (15 to 50 seconds)	20
To load an average of 206 passengers through 14 doors (15 to 30 seconds)	20
To close the car doors and give the signal, by means of bell rope to motorman	13
Total average time of express trains at station platforms between stopping and starting during the height of the rush hours	55

Defects.

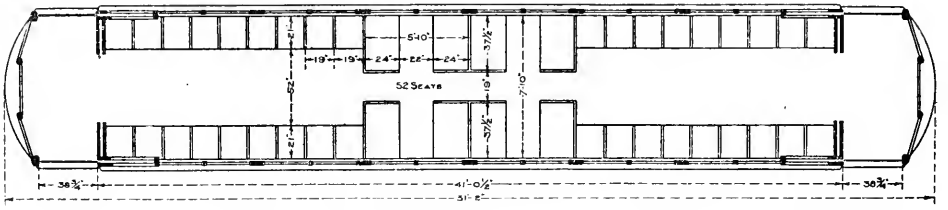
Two of the defects which stand out prominently in the operation of the subway are, first, the excessive use of the transfer privilege and, second, the use of the same end doors in the cars for both the entering and the leaving passengers. Apparently the only permanent way to improve these conditions is either to reduce or abandon the transfer privilege, or to change the cars. While it may be contended that such convenient means of transferring at so many points should not have been provided, it is my opinion that this principle, having been established, cannot now be withdrawn, and that the only remedy, therefore, is to change the cars. To state the case briefly, the principal defect in the present car is due to the fact that a definite and ready circulation of traffic is not provided for and that owing to the lack of sufficient doors properly located the maximum carrying capacity of the car cannot be easily and quickly reached.

Possible Improvements.

If the present arrangement of signals is retained, the only possible way to secure an increase in the capacity of the subway from 30 trains per hour to 40 trains per hour is to scrap or use elsewhere the entire subway car body equipment and build new cars at an expense of at least $5,000,000, and to rearrange the present platforms, which is practically prohibitive.

If, on the other hand, the signal system can be improved in such a way that even the present trains can be passed through the stations on a headway of 105 seconds (1¾ minutes) it will require only a comparatively simple alteration in the car to reduce the allowed stop of 50 seconds to 35 seconds and thus secure the 15 seconds' saving which will make the desired 90-second headway possible. The most economical and efficient, as well as the quickest way, therefore, to secure a capacity of 40 trains per hour in the subway is to improve the signal system (as recommended in my report of January 18, 1908) and at the same time alter the present cars sufficiently to limit the platform waits to a maximum of 35 seconds.

To secure this result it is evident that the loading and unloading must be carried on at the same time. Some improvement should also be expected from the use of pneumatic door handling equipment and an electric door signal. These changes should easily bring the actual wait at the station platform down to the following figures:



New York Subway Cars—Figure 1—Present Subway Car, Showing Seating Arrangement and Single Doors at Ends.

	Seconds.
To open doors after train is stopped	2
To unload 163 passengers through 14 doors, and to load 206 passengers through separate doors, both processes being carried on at the same time	20
To close doors and give signal to motorman	8
Total average time of trains at express stations during rush hours should not exceed	30

No change should be allowed which will reduce the total number of seats per hour now provided by the subway cars. The rule should be that the increased number of seats made available by the extra cars must be at least equal to the total number eliminated on account of the space occupied by the extra doors.

If 40 trains of eight cars each are passed through a station each rush hour, each car having additional doors to provide for the more comfortable and rapid handling of the passengers, it will require but 40 seats per car to provide the same number of seats that are at present supplied by thirty 8-car trains per hour. The new cars, therefore, should not have less than 40 seats. Any greater number of seats than 40 per car will indicate a corresponding increase in the total number of seats available.

A successful car for the present subway should possess as many as possible of the following requirements:

1. Separate entrances and exits.
2. A space which can be cleared so as to be ready to quickly receive the passengers boarding a car.
3. Convenient means of circulation inside the car.
4. Standing room space contiguous to the exits.
5. As many cross seats as practicable.

6. Exit and entrance doors sufficiently removed from each other to allow for the car stopping convenient to guiding rails on the platforms.

7. Doors located so as to minimize the danger from open spaces at curve platforms.

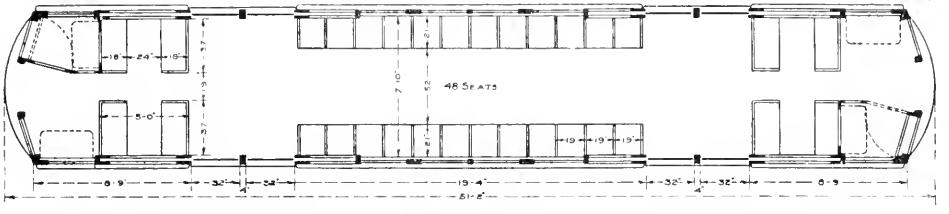
The various cars may be classified in accordance with the number of doors in the sides of the cars as follows:

Cars with central side door and end doors.
Cars with two quarter side doors.
Cars with three doors near center.
Cars with multi side doors.
Cars with double doors near ends.

Each one of these types may have seats of either the longitudinal, the cross "back to back," or of the "walkover" style, or a combination of two or more styles.

Cars with Central Side Door and End Doors.

The present cars could be altered to provide central side doors. I have made a number of studies of details of construction and general arrangement of seats applicable to a car of this type. Cars of this type have been in use on the Brooklyn bridge shuttle trains for many years. They have recently been introduced for subway and elevated service in Boston and Philadelphia, and have been adopted by the Hudson Companies for use in the new tunnels between Manhattan and Jersey City. The successful use of the central side door car in terminal work, however, does not furnish a precedent which demonstrates that this type of car would be satisfactory under subway conditions, whereas the failure of the center door car on the Boston subway to reduce the length of stop to much less than the time required in the New York subway, even with the present end door cars, does not furnish any encouragement toward rebuilding the present subway cars so as to provide them with central doors. To get the full benefit of the introduction of central doors in the sides of the cars, it would be necessary to extend each platform at least 50 feet.



New York Subway Cars—Figure 2—Car with Quarter Side Doors, Cross and Longitudinal Seats.

Car with Two Quarter Side Doors.

Upon roads where the traffic is not as heavy as in the subway, a type of car with two doors, each located about one-fourth the length of the car from the end, is sometimes advocated. This type of car would have as many doors as the present end door car, but the doors dividing the car into quarters would give the quarter door car the advantage of providing the shortest average distance from the door to the seat. This car would therefore cause the passengers to occupy the center of the car and thus use the entire length of the car more effectively than it is now used in the present end door type.

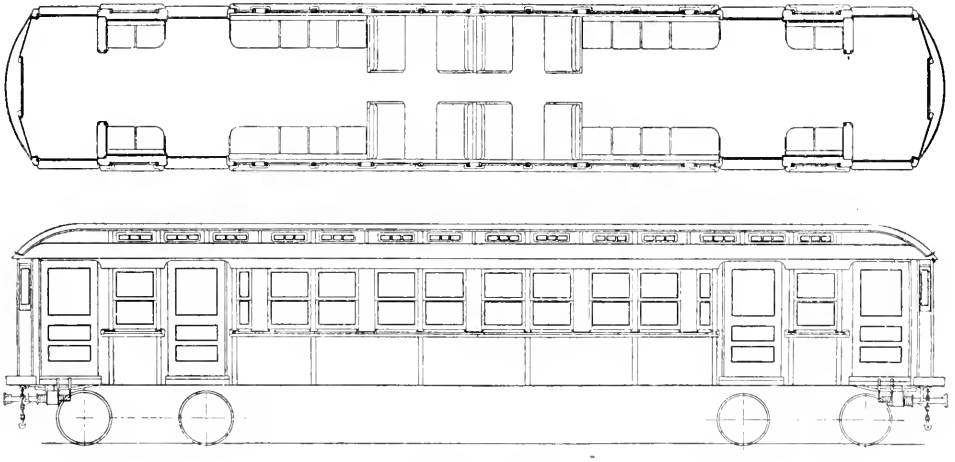
The location of the train guards would be a problem with this type of car, as these guards could not work to advantage from between the cars as at present. If future subways could be constructed sufficiently in advance of the demand for them, then the type of car shown in Figure 2 could be used to good advantage, and cross seats could be substituted for the longitudinal seats. Under present conditions, however, there would be a temptation to move in the other direction and fold up the longitudinal seats during rush hours, thus providing increased standing capacity.

Cars with Three Doors Near Center.

Cars with three doors near center would lend themselves conveniently to an effective system of platform guard rails, but the center door would be a disadvantage at curved platforms.

Cars with Multi Side Doors.

Cars of this type are in successful use in the suburban service of the Illinois Central Railroad in Chicago. These cars are 72 feet long over all, and 10 feet 6 inches wide over the sheathing. There are 12 sliding doors on each side, opening on a level with the platform, and two doors on each side, opening to steps which are used at stations where there are no high platforms. An electric signal apparatus is connected with the doors so that a signal is automatically transmitted to the engineer when the last door in the train is closed by the conductor.



New York Subway Cars—Figure 3—Recommended Type—Present Car After Being Altered into a Car with Double Doors Near Ends.

It is fair to assume that with an 8-door car in the subway passengers would be unloaded and loaded at the rate of not more than four persons per second per car. Without an attendant for each door it is difficult to see how the use of the multi side door car in the subway would reduce the present

time of loading and unloading by more than one-half; that is, the present rate of passenger movement of two persons per car per second maintained with the present end door car might possibly be increased to four passengers per car per second with the multi side door car.

The final serious objection to the multi side door car in the present subway is the fact that practically the entire car bodies now in use would necessarily either be scrapped or used elsewhere, as it would be practically impossible to rebuild them so as to provide eight side doors on each side of each car.

Cars with Double Doors Near Ends Recommended.

Without weakening the present car, or adding materially to its weight, it is possible to introduce additional side doors, one near each end of each side of the car and as near as practicable to the present end doors, the distance between the doors being at least sufficient to furnish a pocket for the sliding doors.

It will be seen by referring to Figure 3 that these additional doors can be added without disturbing the present seating arrangement of the car to any great extent. It is true that the introduction of these doors will make it necessary to remove eight seats from each car, but the operation of the cars in actual service will make it possible to pass so many more cars through the subway that the loss of eight seats in each car will be more than offset by the additional seats in the added cars, and the extra standing room, so convenient to the separate exit, is a feature which will decrease the station waits, and thereby increase the schedule speed.

This car provides a separate space for leaving passengers to collect around the exit doors without blocking the space which should be provided for the passengers entering the car. The result will be that passengers will move in and out much more quickly than at present, and the movement of passengers into the car will facilitate the movement of passengers out of the car.

There is no reason why a rate of flow of passengers in and out of the car amounting to at least five passengers per car per second should not be expected with this car with double doors near the end, and this rate is fully as good as the experience in Chicago would lead us to expect from the multi side door cars, even with eight doors distributed the entire length of the car.

Both the exit and the entrance doors are directly under the eye of the guard. This car lends itself readily to the introduction of platform railings at all of the more important station platforms. These railings can be arranged as shown in Figure 4, which will indicate at once the advantages of collecting the passengers who are waiting for a train at definite loading points, thus leaving the remaining parts of the platform free and ready to receive the unloading passengers.

The present cars can be changed to conform to this arrangement for an expense of about $2,000 for each steel car, and about $1,500 for each composite car.

For the present subway this car seems to me to possess more advantages and fewer disadvantages, both from the standpoint of the public and the operating company, than any other type, and its use will increase the capacity of the subway sufficiently to fully justify the expense of altering the present cars into cars of this type.

My recommendations, summarized, are as follows:

(1) That every car used in regular passenger service in the present subway be provided with two additional side doors, located near the ends approximately, as shown in Figure 3.

I recommend this car for the following reasons:

(a) The double door space at each end of the car will greatly reduce the present station waits.

(b) The separate exits and entrances will remove the present uncomfortable conflict at the car doors.

(c) The present cars can be altered into this type of car without detracting from their structural strength, or materially altering the present seating arrangement.

(d) The result in increased carrying capacity due to the changes will abundantly justify the investment.

(e) This is the only type of car with additional doors that will not materially increase the present trouble due to curved platforms.

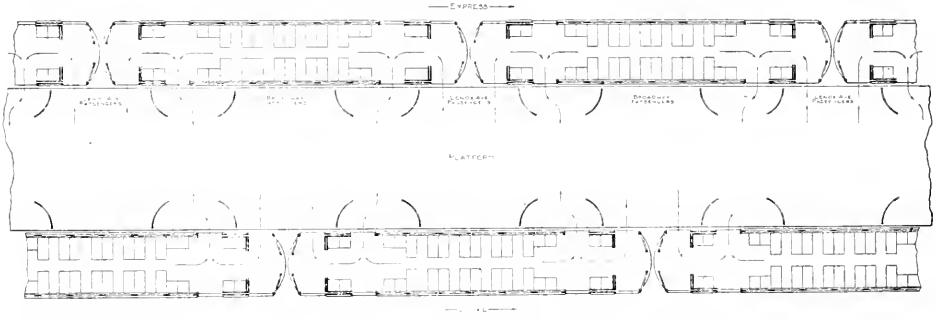
(2) That all cars be provided with either pneumatic or other means for quickly opening and closing the doors and with signals, which will automatically indicate to the motorman when the last door is closed.

(3) That all new cars be of metal and provided with seats more economically arranged.

(4) That when the cars of the double end door type are put into service, a system of platform railings, similar to that shown in Figure 4, be provided to direct the passengers.

(5) That for future subways a wider car should be considered. This car may be a multi side door car, if separate platforms can be arranged for each class of trains, and if the stations can be designed to control the flow of passengers at the entrance to the platform, instead of directly at the car doors. If, however, it is found that it is impracticable to design stations with sufficient room for waiting passengers independent of the station platforms, it will probably be found that the best car for future subways is a wide car of the type with double doors near ends.

(6) That if it is found that future subways cannot be built without the occasional use of curved platforms, the cars for these future subways should be designed so as to allow the station platforms to extend under the car in such a way that the necessity for sliding platforms will be obviated.



New York Subway Cars—Figure 4—Arrangement of Guiding Rails on Station Platforms, to be Used in Connection with Recommended Type.

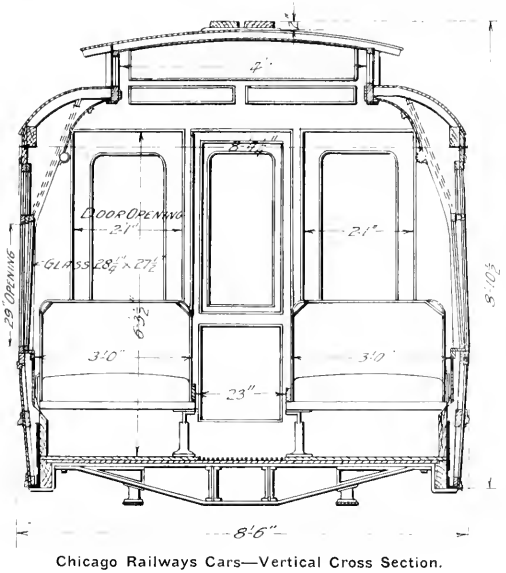
New Pay-As-You-Enter Cars in Service in Chicago.

The Chicago City Railway Company on Wednesday of this week placed 100 new pay-as-you-enter cars in service on the Indiana avenue line. The new service was successful from the start, as most of the passengers have become familiar with the pay-as-you-enter system since 125 cars of that type were put in operation on the parallel Cottage Grove avenue line in November. The company's officials state that the pay-as-you-enter car is no longer regarded as an experiment, but as a complete success. The new cars replace 85 double-truck cars of the older type, which were transferred to the State street line. The old State street cars have been sent to the shops to be remodeled, with longer platforms, so they may be easily converted into pay-as-you-enter cars if it is decided to do so at a later time. The new cars are like those previously furnished the company by The J. G. Brill Company, which were described in the Electric Railway Review of September 21, 1907, page 332.

Besides carrying the mail on the Peoria-Bloomington line the Illinois Traction Company is carrying pouches from East St. Louis to Springfield, Springfield to Decatur, Decatur to Danville and from Peoria to Springfield.

NEW CARS CHICAGO RAILWAYS COMPANY.

The board of supervising engineers Chicago traction has just completed its specifications for the 300 cars to be purchased for use on the Chicago Railways Company's north and west side lines. It will be noted from the accompanying illustrations that these cars are to be of the pay-as-you-enter type. The car from bulkhead to bulkhead is 32 feet 5 inches long with two platforms, each 8 feet 4½ inches long, arranged for double-end operation with details quite similar to those in service on the new pay-as-you-enter cars of the Chicago City Railway. The car body is 8 feet 6 inches wide over all and 8 feet 10½ inches high from bottom of side sills to top of trolley board. The maximum height of the body bolster above the top of the rail is indicated as 30 inches.



Chicago Railways Cars—Vertical Cross Section.

The windows will be arranged to raise into the roof, affording a 29-inch window opening. The height of trolley board above the rail is 11 feet 8 inches. The accompanying drawings show an elevation, a floor plan with seating arrangement and a vertical cross section with general dimensions.

Surface Finish on Concrete Construction.

In a recent paper M. C. Tuttle, secretary of the Aberthaw Construction Company of Boston, gave the results of some of the experience of this company in concrete construction, particularly as relates to the finish of concrete surfaces. Briefly told, the different finishes and their characteristics are as follows:

Granolithic finish secured by careful troweling furnishes a good protection, is water-tight, but is not always satisfactory in appearance.

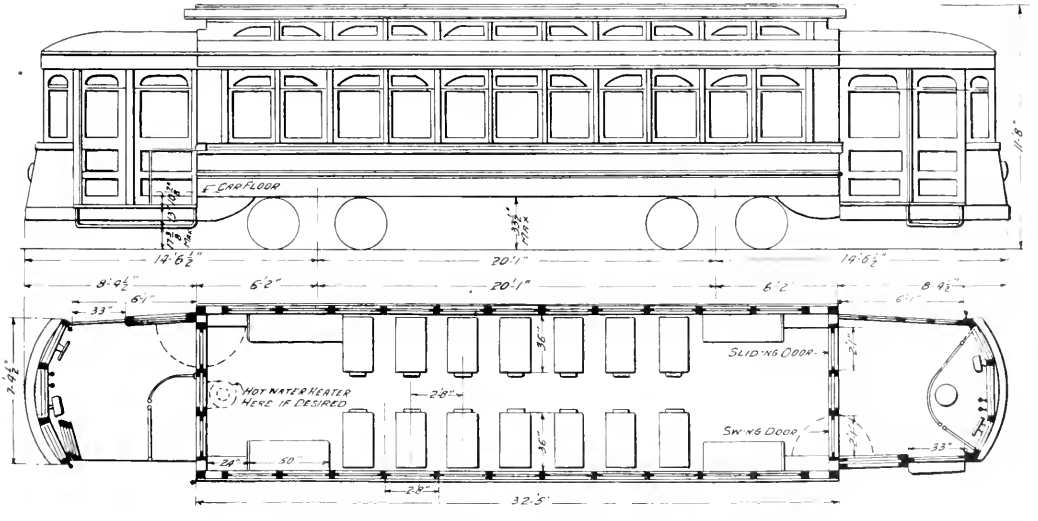
Rough picked work gives a pleasing surface with some variation in color, and if properly done is not injurious in its general effect upon the construction. It is particularly adapted to landscape and ornamental work.

A rubbed mortar surface can be obtained by the use of water and carborundum stone. This is an excellent finish for factory buildings and the like. It costs no more than picking.

An air blast finish can be given by inexperienced men with fair economy. This method was used by the Aberthaw Construction Company in finishing the stadium at Harvard University.

A hammered surface obtained by the use of the ordinary many bladed stone hammer gives a good finish for detail work and for concrete block.

Sulphuric acid is sometimes rubbed into the surface with a steel brush and the cement particles thereby dissolved away from the rest of the material, bringing out the color very effectively.



Chicago Railways Cars—Floor Plan and Elevation.

Mr. Tuttle considers that in the future there will be less attempt to shape the concrete in molds corresponding to the finished size. It will be cheaper to make them smaller and plaster the surface, or use some other means of finishing.

ACCOUNTING CIRCULAR OF THE INTERSTATE COMMERCE COMMISSION.

Circular No. 20 of the Accounting Series, which pertains to electric railways, has just been issued by the interstate commerce commission, though dated January 10. It contains a discussion by Prof. H. C. Adams, in charge of the division of statistics and accounts of the commission, an abstract of which follows:

Acting under the authority conferred by the twentieth section of the act to regulate commerce, as amended June 29, 1906, the interstate commerce commission has undertaken to prescribe a standard system of accounts for steam railways, electric railways, express companies, sleeping car companies, carriers by water (as described in the act) and pipe lines. In view of the nature of this task, and of the public interest involved, the commission regards it as essential that the same fundamental accounting principles should be applied to all the above agencies of transportation, and that the classifications of revenues and expenses should be the same, so far, at least, as the general accounts are concerned.

It should be distinctly understood that the interstate commission represents the interests of the states, as well as its own interests, in this effort to develop a uniform system of accounts for electric lines. There are at the present time 30 states the laws of which give to state railway commissions or other legally constituted bodies, jurisdiction over electric railways, and this circular is issued after correspondence with, and approval of, the representatives of the state governments. This being recognized, it is evident that this is the only practicable means of attaining the results regarded as essential by both federal and state governments.

This circular, addressed to accounting officers of electric railways, conforms to the method of procedure followed in the case of all other carriers for which it is proposed to prescribe a standard system of accounts. It is recognized that the co-operation of practical accountants is essential for arriving at the best results, and, as a means of obtaining this co-operation, circulars have been issued asking specific questions, or, as in the case of this circular, tentative classifications have been submitted, accompanied by a request for criticisms and suggestions. In no other way is it possible to bring the knowledge and experience of practical accountants to bear upon the problem in hand.

The tentative classification of operating expenses is drawn on a plan which indicates four different classes of accounts, viz.: First, general accounts, indicated by a prefix of Roman numerals; second, subgeneral accounts indicated by a prefix of capital letters; third, primary accounts, indicated by a prefix of Arabic numerals; fourth, subprimary accounts, which are optional with carriers, and are to be indicated by small letters.

The general accounts are for use in grouping the items into a condensed form of report, it being understood that in all statements, Group I and Group II under General Account IV "Transportation expenses" shall be shown as separate items. The subgeneral accounts are provided for the use of small electric lines whose operations are not of such magnitude as to warrant greater detail in accounting; such companies are to be designated as those having a gross annual revenue of less than $50,000. The primary accounts are provided for use of the larger lines, including all those having a gross annual revenue of $50,000 or over. Provision is made for subprimary accounts in case a further subdivision of the primary accounts is desired by the individual carriers or by state commissions; but the interstate commission refrains at this time from prescribing any further subdivision of the accounts than is indicated by the primary accounts.

Abbreviated Classification.

The following analysis shows the accounts to be kept by the smaller lines. The reports required of them will call for an accurate statement of expenses assignable to the subgeneral accounts as indicated by capital letters:

I. Maintenance of way and structures:
- A. Maintenance of way.
- B. Maintenance of electric line.
- C. Maintenance of buildings and structures.
- D. Maintenance of service equipment.
- E. Availability maintenance expenses.
- F. Adjustment accounts—maintenance of way.

II. Maintenance of equipment:
- G. Maintenance of revenue equipment.
- H. Maintenance of electric equipment of revenue equipment.
- I. Depreciation estimate—revenue equipment.
- J. Maintenance of power apparatus.
- K. Miscellaneous maintenance of equipment expenses.
- L. Adjustment accounts—maintenance of equipment.

III. Traffic expenses:
- M. Traffic expenses.

IV. Transportation expenses:

Group I.—Power.
- N. Power manufactured.
- O. Power purchased.
- P. Adjustment accounts—power.

Group II.—Operation of cars.
- Q. Wages of car operators.
- R. Other car operating expenses.
- S. Injuries and damages.
- T. Adjustment accounts—transportation.

V. General expenses:
- U. General expenses.
- V. Adjustment accounts—general expenses.

The operating expense accounts proposed for the larger lines are stated in the tentative classification [published elsewhere in this issue.—Eds.], and by comparing the above list of subgeneral accounts with the primary accounts of the classification, the relation of the rules of accounting for the large and the small lines becomes evident. The general accounts are the same for both, but there are 116 primary accounts provided for large lines as against 22 subgeneral accounts for small lines.

Moreover, the small lines are to follow the text descriptive of the primary accounts provided for the large lines, which can easily be done, for the reason that each subgeneral account is in fact a grouping of primary accounts.

The depreciation accounts provided in this classification have been stated as follows: First, depreciation accounts for application to equipment; second, depreciation accounts for application to maintenance of way and structures. Depreciation accounts for maintenance of way and structures have not as yet been prescribed for steam carriers, and their appearance in this classification does not mean that it has been finally decided to require them of electric carriers. Provision has been made for them in the tentative classification herewith submitted, in order that those carriers that desire to charge depreciation on other property than equipment may exercise that liberty in proper form; also that any state commission desiring to prescribe depreciation charges for all classes of property may do so in proper form and in strict harmony with the general system of accounts prescribed for all agencies of transportation.

Joint Facilities.

Particular attention is called to the joint facilities accounts (see accounts Nos. 45, 46, 66, 67, 104, 105, 115 and 116), which are provided in order:

1. To state the operating expenses of each carrier under its own primary accounts without reference to any service rendered by it to another carrier or to any service rendered by another carrier to it; or, in other words, to permit that the participation of any carrier in the operations of another carrier may, by means of the joint facility accounts, be so shown that a combined statement of the operating expenses of all carriers would represent neither more nor less than their true expenses of operation.

2. To exclude from revenues the amounts paid by one company to another for service furnished which do not properly represent revenue derived from the public.

3. To exclude from operating expenses such amounts paid as represent the use of capital.

A payment for use of tracks and power (including rent, cost of power and other operating expense) is subject to analysis which should result in determining what portion is assignable to each of the following classes: (1) Use of capital (or rent); (2) maintenance expenses; (3) transportation expenses; (4) administrative expenses (if any). The determining of these elements will enable both a lessor and a lessee company to handle the subject properly, the lessor company crediting and the lessee company debiting its accounts as follows: (1) Rent, income account; (2) maintenance expenses, Accounts 45 and 46; (3) transportation expenses, Accounts 104 and 105; (4) administrative expenses, Accounts 115 and 116.

By excluding from operating expenses the cost representing the use of outside capital the result is that the amount stated as operating expenses represents the operating cost incident to the employment of the capital to which it corresponds, and by specifically separating all capital charges from operating expenses the relative and proper correspondence is preserved.

This method of accounting is particularly applicable to the needs of the commissions in determining the results of specific capital employed, and also in assembling statistics

TENTATIVE CLASSIFICATION OF OPERATING EXPENSES OF ELECTRIC RAILWAYS.

I. Maintenance of Way and Structures.

A. Maintenance of Way.
1. Ballast.
2. Ties.
3. Rails.
4. Rail fastenings.
5. Frogs, switches and special work.
6. Underground construction.
7. Paving.
8. Roadway and track.
9. Tunnels.
10. Bridges, trestles and culverts.
11. Over and under grade crossings.
12. Grade crossings, fences, cattleguards and signs.
13. Signals and interlocking plants.
14. Telegraph and telephone lines.
15. Other maintenance of way expenses.
Depreciation estimate "Roadway."

B. Maintenance of Electric Line.
Transmission Lines—
17. High-tension transmission lines.
Ditribution System—
18. Overhead feeders.
19. Underground feelers.
20. Track bonding.
Conductors—
21. Overhead trolley lines.
22. Third-rail conductors.
23. Underground conductor rails.
24. Miscellaneous electric line expenses.
Depreciation estimate "Electric Line."

C. Maintenance of Buildings and Structures.
26. Power generating plant buildings.
27. Power substation buildings.
28. General offices.
29. Car houses and shops.
30. Stations, waiting rooms and other buildings.
31. Docks and wharves.
32. Miscellaneous buildings and structures expenses.
Depreciation estimate "Buildings and Structures."

D. Maintenance of Service Equipment.
34. Snow equipment.
35. Work cars.
36. Electric locomotives (utility).
37. Miscellaneous service equipment.
38. Depreciation estimate "Service Equipment."

E. Availability Maintenance Expenses.
39. Care of track.

into totals which will represent the service to the public and remedy a definite and long-felt deficiency in the subject which these particular accounts meet.

This circular is submitted to the electric carriers for consideration and criticism, and in order that the replies received may be as definite and concise as possible, the following specific information is requested: Name of company; number of miles of line operated; number of cars operated under normal conditions; what limit, in your opinion, should be used as a line of demarcation indicating the distinction between a large and a small company? What would be the approximate aggregate charge to operating expenses for the year ending June 30, 1908, resulting from the application of the theory of depreciation to the equipment of your company as outlined in this classification? Explain in detail the method by which you arrive at the amount stated. What is the present surplus (or deficit) from operation of your company, and in what particular years did it accumulate? Please give a list of joint facilities involved in the operations of your company. Do you consider the principles involved in the joint facility accounts as applicable to electric railway carriers?

Professor Adams also invites general criticisms and says that it is not intended that the answers made to the inquiry should be confined to the specific questions enumerated. Replies to the circular are desired in duplicate, one copy to be forwarded to Elmer M. White, secretary American Street and Interurban Railway Accountants' Association, Birmingham, Ala., and the other copy to Professor Adams. It is desired that replies be made not later than March 28, 1908.

Text of Depreciation Accounts.

The text of the tentative classification of operating expenses states under "Depreciation Estimate, 'Roadway,'" that "depreciation charges on maintenance of way property are not required at this time by the interstate commission. It is arranged, however, in this classification to introduce this account to provide rules for computing depreciation charges on maintenance of way property for the guidance of those carriers that desire to make such depreciation charges, and for the use of such commissions of the various states as may

prescribe them. Optional accounts are therefore inserted for the various classes of property included under maintenance of way. The same statement and optional accounts are presented touching electric lines, and buildings and structures.

Formal depreciation accounts for the different classes of equipment as presented as part of the tentative classification. Under primary account No. 59 the subaccount (a) Depreciation Estimate—"Passenger Cars" is divided as follows:

(a-1) Passenger cars—estimate:

This account includes a monthly charge of one-twelfth of ... per cent per annum of the original cost (estimated, if not known) of passenger cars, to provide a fund for replacement when retired.

Note.—Where, in the opinion of the carrier company, depreciation can be more accurately estimated by basing the estimate upon the service rendered by the property, such method of estimate may be permitted, in case the carrier company first files with the ..... commission a statement of the rule or principle upon which it will base its estimates of depreciation, subject to disapproval by the commission.

(a-2) Passenger cars—renewals:

This account includes the original cost (estimated, if not known) of all passenger cars condemned, destroyed or sold, less:

Amount previously charged for depreciation up to date of retirement; plus

Scrap value of salvage or the amount received from sale of passenger cars retired.

Note A.—Passenger cars permanently retired from service but held, pending disposition, should be written out of service through this account, and carried in an appropriate material account at a nominal valuation or at actual scrap value, if determinable.

The circular also contains the discussion relating to depreciation which is published in the classification of operating expenses prescribed for steam railways.

The tentative classification for construction expenditures is changed only slightly from that published in the Electric Railway Review of December 21, 1907, page 958.

THROUGH ROUTES RECOMMENDED FOR CHICAGO ELEVATED LOOP.

Ford, Bacon & Davis of New York have completed the investigation started last June at the request of M. B. Starring, president of the Northwestern Elevated Railroad of Chicago, concerning the subject of improvement of the terminal facilities and especially the enlargement of the capacity of the Union Elevated loop. This firm has submitted a summary of its conclusions, which has been transmitted to the authorities of the city of Chicago by Mr. Starring. An abstract follows:

Through Routing.

Based on a detailed examination we believe that a plan of through routing can be adopted, even under diversified ownership, which will be more convenient for the traveling public than the present operation around the loop and will increase largely the number of cars that can be operated through this terminal district during the rush hours.

This plan contemplates through routing only between the Northwestern Elevated Railroad and the South Side Elevated Railroad, inasmuch as we believe it would be impracticable in addition to through route from the north and south sides to the west side, and through travel in the latter direction can be accommodated by means of transfers. The operation of the west side lines can be made more satisfactory to the public by the operation of loop trains of the Humboldt park and Logan square branches of the Metropolitan West Side Elevated Railway to the loop over Lake street by means of a connection between the Metropolitan and Lake street structures near Paulina and Lake street. This would shorten the time of travel between these branches and points on the loop and would also enable the Metropolitan company to operate into the loop more trains than at present.

The plan for through routing between the north and south sides contemplates the operation of such through-routed trains in both directions on both sides of the loop, supplemented, for the benefit of the west side, by an exchange of transfers without the payment of additional fare, between cars coming from the west side and these through-routed trains.

This plan of routing in conjunction with the lengthening of platforms, rearrangement of station stops and the operation of 6-car trains upon all roads, will enable the operation at the peak of the rush hour of trains at the rate of 1,164 cars per hour, as compared with the recent rush-hour operation at the rate of 588 cars per hour upon which our calculations were based, which practically doubles the present operation on the loop. We see no reason why 7 and 8 car trains should not be operated ultimately.

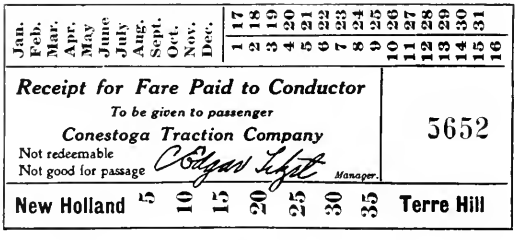
Auxiliary Terminals.

In addition to the increase of terminal capacity above outlined, the Northwestern Elevated Railroad should build an auxiliary stub terminal as contemplated, at North Water street, which would provide stub terminal facilities, which are now used by the other three elevated companies. This stub terminal can later, if deemed desirable, be supplemented by an additional stub terminal crossing the river at Dearborn street, which latter would be a reserve against accident to the present Wells street bridge.

The use of these stub terminals will provide sufficient terminal capacity for the passenger traffic of your company until such time as a subway can be constructed from the north to south side in which the city shall provide space for your trains. We believe that by the time such subway is constructed the elevated traffic will have increased sufficiently to warrant the use both of the present loop, the stub terminals and the subway. We have taken into consideration in our recommendations in this particular the history of electric railway transportation systems, not only in Chicago, but also in New York and other large cities, where it has been found impossible to construct such terminal facilities fast enough to keep up with the increase in passenger traffic.

PRIZES FOR RETAINING FARE RECEIPTS.

With a view to interesting passengers and encouraging them to retain their fare receipts, the Conestoga Traction Company, Lancaster, Pa., has introduced the practice of giv-



Conestoga Traction Company—New Fare Receipt.

ing away each month $25 worth of transportation to persons holding receipt numbers announced by the company at the end of each month. One of these fare receipts is reproduced herewith. On the reverse side of that half of the receipt given to the passengers is the following announcement:

"Keep This Receipt."

"It may entitle you to FIVE DOLLARS' worth of transportation. On the first day of each month this company will give away to holders of CASH FARE RECEIPTS five coupon books, each containing one hundred 5-cent coupons, good for passage on all suburban lines. Watch for the lucky numbers."

SOUTH SIDE ELEVATED RAILROAD EXTENSIONS AND IMPROVEMENTS.*

BY GARRETT T. SEELEY, ENGINEER OF MAINTENANCE.

The opening of the stock yards branch in the early spring will mark the completion of the programme of extensions and improvements that has been in progress on the South Side Elevated Railroad in Chicago for the last five years. Previous to this the system consisted of a double-track road extending from Sixty-third street and Jackson Park avenue, where in 1893 was located a terminal station in the World's Fair grounds, to a connection with the union loop at Van Buren street. This is a distance of 8.56 miles and the total single-track mileage, including the yard at Sixty-first street, was 21.14 miles.

The new construction work in brief was as follows: Extensions to Englewood, Kenwood and the stock yards; the construction of a third track for express service; the construction of yards for the storage of cars; the addition of 150 new cars; and increased facilities for the production and distribution of power.

When fully completed the system will consist of 16.13 miles of single track—including yards and sidings, more than double the former mileage. (A description of the new construction work and of the details of the steel structure appeared in the Electric Railway Review of August 31, 1907, page 251.)

The track construction follows, in general, the standard as adopted on all the elevated lines in the city, except that screw spikes have been used to secure the track rail. It was found that the common square track spike so crushed and destroyed the wood fiber in being driven that decay quickly set in, and that ties that were perfectly sound in the middle were so rotten under the rail as to require removal. In applying the screw spike a hole is first bored in the tie the size of the body of the spike, and when it is screwed down the threads press into the fiber of the wood, completely filling the hole and resisting a pulling effort equal to the strength of the spike itself. The track rail is 80-pound A. S. C. E. standard, with "Continuous" rail joints and laid on flat tieplates, 3/8 inch thick, with a shoulder on the side of the outer edge of the base of the rail.

All junctions and terminals have been equipped with interlocking plants to control the switches and signals. At Sixty-ninth street is located a mechanical interlocking plant, all the rest being electro-pneumatic installations built by the Union Switch & Signal Company. With the completion of the stock yards branch there will be in all a total of 11 electro-pneumatic interlocking plants in service, and 5 mechanical plants, a total for both classes of 16, 14 of which are in daily service.

Express Track.

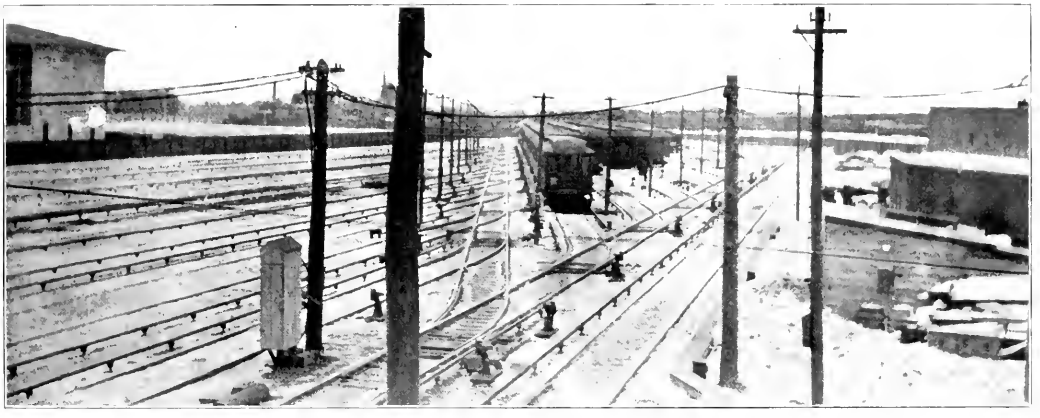
The third track for express service extends from Forty-third street to Twelfth street. Northbound express trains now utilize the middle track from 7 a. m. to 9:30 a. m., and southbound express trains from 4:50 p. m. to 6:30 p. m. The trains attain a maximum speed of 35 miles per hour and make the run between Congress street and Forty-third street in about 10 minutes—a distance of 4.39 miles, which is at the average speed of 26.3 miles per hour.

The construction of this part of the new work was very slow and expensive. It involved shifting all the curves, rebuilding every station, moving the platforms and, at several places, shifting the entire structure to suit local conditions.

Signaling System.

To give protection to the large number of express trains running at a high rate of speed on the middle track, a system of electro-pneumatic block signals has been installed by the Union Switch & Signal Company. The blocks have a maximum length of 1,400 feet, with shorter blocks where the speed is reduced at curves and near terminals. These signals consist of dwarf signal stands of the same design as those at the interlocking plants. The signal arm is held in a clear position when the block is not occupied by the action of compressed air, and when the air is released the arm moves to the horizontal or danger position by the action of a heavy coil spring.

The signals are governed by track circuits. One track rail is insulated both from the structure and from the opposite track rail, and is divided into sections by insulated rail joints. The other track rail is a common ground for the return propulsion current and for the signal circuit. The insulated rail is then connected to a 6-cell storage battery through the proper resistances, and through a relay to the signals governing the section. The differences in potential between the two rails is about five volts, and when a train passes an insulated joint and enters a block it short-circuits the two rails and the signal goes to danger. As long as any pair of wheels is in the block the signal remains at danger, and as soon as the rear end of the train passes the insulated joint at the end of the block the relay picks up and the signal at the entrance to the block clears.



South Side Elevated Railroad—Sixty-third Street Storage Yards.

Storage Yards.

Until the construction of the new extensions the only storage yard for cars was at Sixty-first street. This yard was a wooden structure and had trackage for only about 180 cars, the rest being stored on the middle track on Sixty-third street. The condition of the yard structure was such that it required the expenditure of large sums of money for maintenance and was a constant source of danger from fire. So it was replaced by a yard of steel construction on concrete foundations.

On the Englewood branch a steel yard five tracks wide has been built with a capacity for 100 cars. For the protection of cars from fire in this yard a fire car has been built and equipped. (This car was described and illustrated in the Electric Railway Review of November 9, 1907, page 764.) A similar car has been built for the yard on the Kenwood branch and one will be built for the stock yards branch.

In the Sixty-first street yard a 4-inch water main, with frequent standpipes, extends the length of the yard. This is connected to an electric fire pump, located in the shop, that may be started at a moment's notice and a pressure of 60

*Abstract of a paper presented before the American Institute of Electrical Engineers, Chicago Section, February 18, 1908.

pounds per square inch afforded immediately. A steel yard with a capacity of 42 cars has been built at the end of the Kenwood branch at Forty-second street. The yard for the stock yards branch, also of steel construction, will allow the storage of 60 cars. On the main line between Calumet and Prairie avenues track room for over 280 cars has been provided. All the tracks are laid on the surface, connection with the elevated structure being made by a concrete and steel incline across Sixty-third street. The tracks for storing cars are all located east of the incline track. Just south of Sixty-third street a large area has been reserved for the construction of new shops.

The space west of the incline track is used for the storage of track material and coal. A connection has been made with the Lake Shore & Michigan Southern Railway, over which all material and coal can be switched into the yard and then transferred to any point by electric locomotives. Room is afforded for the storage of from 10,000 to 15,000 tons of coal. This coal is unloaded from the cars by a revolving locomotive crane operated by steam. It will operate a 10-ton load at 12 feet radius and a 3½-ton load at 30 feet radius. The clamshell bucket has a capacity of 1½ cubic yards and will handle one ton of coal at each operation.

The tracks are so arranged that the crane can unload from the railroad car and either dump the coal on the ground or load it into the elevated railroad's coal cars. During the elevation of the Chicago Junction Railway tracks at Fortieth street all the coal for the power house was delivered in this manner for a period of several months. The clamshell bucket will remove about 90 per cent of the coal from an ordinary flat bottom coal car. One crane man and two laborers in 10 hours can unload and load into other cars ten 50-ton cars, and can accomplish about 50 per cent more if storing the coal on the ground.

Car Equipment.

The present equipment of the road consists of 400 passenger cars and 14 work and coal cars.

Originally there were 180 trailer cars, hauled by steam

South Side Elevated Railroad—Coal Tracks in Rear of Power House.

locomotives, but in 1898 the road was electrified and 150 of the old trailer cars were converted into motor cars. These cars were equipped with two G.E.-57 motors, placed on one new motor truck, one of the old Baldwin trailer trucks being retained. The Sprague multiple-unit system of control was adopted and it is interesting to note that this was the first time that the multiple-unit system had received a practical test. But the idea of equipping each car with motors of sufficient power to propel itself—all the cars in a train being controlled from the head car and all acting as a unit—appealed so strongly to the operating department and to the consulting engineers that it was decided to adopt this system without its practicability having been demonstrated in actual service. From 1900 to 1903 seventy additional cars were purchased, equipped with G.E.-73 motors of 75-horsepower capacity each and with the Sprague multiple-unit system of control.

In 1905 the last lot of 150 cars was ordered and these have all been put in service. These cars are 46 feet 5¾ inches long over buffer timbers, with a seating capacity of 52. The electrical equipment consists of two Westinghouse-121 motors, rated at 90 horsepower at 550 volts. The control system is the Westinghouse multiple-unit system. The trucks were manufactured by the Baldwin Locomotive Works, one motor being installed on each truck of the car.

Although the two systems of motor control differ so radically in their method of operation, the new equipment has

South Side Elevated Railroad—Crane for Handling Coal in Yards.

been so designed that the two classes of cars work together perfectly, and it makes no difference how many cars of one system are in the same train with cars equipped with the other system.

Power House.

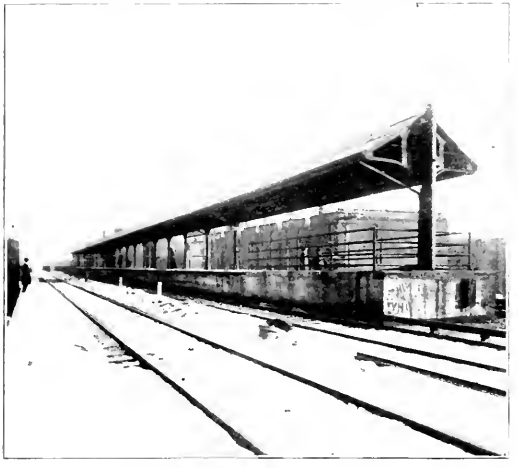
All the power necessary for the operation of the road is generated at the power plant at Fortieth and State streets, being aided by two storage battery installations, one at Fifteenth and State streets and the other at Sixty-first street and Calumet avenue. The power plant is located very nearly at the center of distribution of the road as a whole, being four miles from the loop and five miles from the end of the Englewood branch. In 1905 additional land was purchased and the company now owns the entire block from Thirty-ninth to Fortieth street, between State street and the elevated structure. The building was enlarged and two new units were added, space being provided for a third. The new units are 2,000-kilowatt Allis-Chalmers vertical cross-compound condensing Corliss engines, direct-connected to General Electric direct-current generators. The total capacity of the power plant at present is 11,700 kilowatts rated capacity, or 17,550 kilowatts on a 2-hour rating.

There are a few features of especial interest in connection with the switchboard and feeder installation and the manner of equalizing the generators. The old switchboard was of the double polarity type; that is, a switchboard on which the positive, negative and equalizer buses are installed. This type, at the time the old switchboard was installed, represented the very best design. On the switchboard were located the positive, negative and equalizer switches, thus necessitating all these cables from the generator to be brought to the switchboard, as well as the feeders to be taken away. When the extension of the power house was decided upon the installation of two 2,000-kilowatt units made it necessary with the old switchboard to run twenty 1,500,000-circular mil cables to the switchboard, besides the new feeders required to distribute their output. The distance from these generators to

the switchboard, and the changes necessary to install them, made it very expensive. After making a careful estimate of the cost to connect the new generators with the old switchboard and to install a new switchboard of the single-polarity type, it was found that there was very little difference in cost, while the advantages were all in favor of single polarity, so it was decided to install the latter type. With the old arrangement the machines were equalized on the positive side; with the new or single-polarity type of switchboard the generators are equalized on negative side, only the positive leads being taken to the switchboard.

There are no negative conductors in close proximity to the positive cables. In order to test the lead covering of the cables for any leakage of current each cable is connected to the contacts from the dial head of a rheostat, so that by connecting up a voltmeter to the arm of the rheostat and connecting to ground, each cable may be quickly tested. This is done once each day.

Coal may be supplied to the power house from two different sources. The Chicago Junction Railway has an elevated right of way in Fortieth street, just south of the power house, and from this an elevated spur has been built along the east side of the building. Above and just east of this is a spur from the elevated railroad, on which may be switched a coal train from the Sixty-third street yard. Under these tracks a wooden coal chute has been so built that coal dumped from



South Side Elevated Railroad—Long Station Platform on Kenwood Extension.

either track runs on to a Robins belt conveyor that conveys the coal to the crusher pits and thence into the house. (A view of the coal tracks is presented herewith.)

There is room for seven 50-ton cars on the lower track and for five 30-ton cars on the upper track. The lower track is supplied with a 100-ton Howe track scale.

Storage Batteries.

Until 1905 the railroad company had a storage battery located in a room under the Twelfth street station. The conditions were such that the battery could not be enlarged, so a new building was constructed at Fifteenth and State streets.

This building is a 2-story brick structure with concrete and steel floors and roof, fireproof throughout. The old Twelfth street battery was removed to the upper floor and enlarged by the addition of new plates to a capacity of 1,200 kilowatts, and on the lower floor was installed a battery of 1,000 kilowatts capacity in tanks of sufficient size to admit of increasing it to 2,000 kilowatts capacity for one hour. These batteries, as well as the one at Sixty-first street, were purchased from the Electric Storage Battery Company of Philadelphia.

The acid fumes are carried away by two methods. On the side walls below the ceiling are located openings that lead into ducts built in the wall and carried up to openings located just under the coping of the fire walls. Also in the ceiling are located numerous openings that lead into ducts that are carried to a house located on the roof, in which an electrically driven fan in a separate chamber draws out the acid fumes and discharges them into the open air.

The operation of this battery is a great aid to the power station. It has a capacity sufficient to practically supply the peak load of the north end. In its operation it varies from a discharge of 5,500 amperes to a charge of 2,000 amperes, making the station load for the north end practically uniform.

The storage battery at Sixty-first street is located on the ground floor of the south end of the car repair shops. It was originally installed in 1898, and during the last year was rebuilt and is now practically a new battery. It now consists of 275 cells of G-51 type of the Electric Storage Battery Company, with special deep cells.

This battery is used in connection with a motor-driven booster, manufactured by the Western Electric Company. The booster has a guaranteed output continuously of 1,600 amperes at 70 volts and a momentary load of 3,000 amperes at 60 to 110 volts.

Feeder System and Bonding.

The positive feeder cables are carried in the cable box between the tracks. The feeder system is divided at the power house switchboard into four sections: First, the main line north of Thirty-ninth street; second, the main line south of Thirty-ninth street, including Englewood; third, the Kenwood line; and fourth, the "stock yards" line.

The third rail is fed at each station through quick-break switches, in such manner that the third rail carrying capacity is utilized for the purpose of conducting the power. On the main line the third rail is 40 pounds per yard.

The feeders running north from the power house are eight in number, with a total cross sectional equivalent of 9,000,000 circular mils, all of copper, partly bare and partly with weatherproof covering. By reason of the installation of the enlarged storage battery at Fifteenth street, it was not necessary to increase the feeder capacity on the north end.

The feeders running south are nine in number, with a total cross sectional equivalent of 11,500,000 circular mils. All of these are copper except two, which were installed the last year. These are aluminum, with triple-braided weatherproof covering, each with a carrying capacity equivalent to 1,500,000 circular mils in copper.

With the exception of the copper cable purchased for temporary use during the construction of the third track all the new cable purchased was aluminum, partly bare and partly with triple-braided weatherproof insulation. In all 177,000 pounds of aluminum were purchased.

On the Englewood branch the feeder cables are entirely of aluminum. The joints in the cables are made by slipping aluminum sleeves over the two ends to be joined and compressing the sleeve with a hydraulic press of 25 tons capacity. This pressure is sufficient to make a perfect union between the metal of the cable and of the sleeve.

The third rail on the Englewood branch is the ordinary steel T-rail, weighing 40 pounds to the yard. It is bonded with two No. 0000 compressed terminal bonds, applied in the web of the rail. The joint plates are the common fishplates fastened with four bolts. The 80-pound running rail is bonded with one No. 0000 compressed terminal bond, 10 inches long, applied in the web of the rail.

The steel structure is used in connection with the four running rails, as a conductor for the return current. Each track rail is connected to the structure every 400 feet by one No. 0000 compressed terminal bond. It is necessary to bond the steel structure at each expansion joint. At these points each girder is bonded to the corresponding girder beyond the expansion joint by two No. 0000 stranded bonds with Crown pin-driven terminals, and three soldered bonds of about 400,000 circular mils. This makes a total of eight No. 0000 cable bonds and 12 soldered bonds for the four girders at each expansion joint. The soldered bonds are flat strips of soft copper $\frac{1}{8}$ inch thick, 2 inches wide and 22 inches long. The ends of the bonds are first tinned and then the girder is tinned at the point of application. The bond is then securely riveted to the girder by a $\frac{3}{4}$-inch flat-head iron rivet. Heat is applied and the bond soldered to the iron. The iron rivet holds the bond so that the vibration and strain due to contraction will not break the soldered connection.

The manner of connecting the feeders to the third rail is as follows: At each station is located a switchbox mounted on a concrete base through which enter five conduits. The third rail is broken opposite each box on each track, and each end is connected to a busbar in the switchbox through a quick-break 1,000-ampere switch. The busbar is connected to the feeder cable by a 1,000,000-circular-mil cable. In this way the third rail is utilized as a feeder and yet any section may be cut dead by opening one switch at each end.

At the crossover between Vincennes avenue and Grand boulevard there is an outrider in the third rail located between

the Chicago Junction track and the elevated tracks. To lessen the danger to trainmen from this source, an automatic cutout has been installed through which this outrider is fed. The east end of the outrider is free from any connections and the west end is fed from the third rail on the opposite side of the track through a contactor or switch, such as is used on the Sprague-General Electric type M control. The contactor is normally open and the rail dead.

When a train approaches the crossover the first shoe on the leading car energizes the outrider, which sends a current through the solenoid of the contactor, closing the switch. The outrider is then fed from the third rail on the other side of the track, and the cars passing the crossover may draw current. A train length beyond this outrider an incline has been placed connected to a relay in the contactor box in such manner that when the first shoe of the leading car strikes this incline, the circuit through the solenoid of the contactor is opened and the outrider is dead until the next train passes. A circuit of lights has been so installed in the end of the contactor box that they are lighted as long as the outrider is charged. This device has been installed over two months and has given perfect satisfaction.

Both the third rail and track rails are bonded to the full capacity of the rail with two 500,000-circular-mil concealed bonds, 15 inches long, with Crown pin-driven terminals. To give better contact between bond terminals and the rail, both terminals and rail have been coated with Brown's mercury amalgam. This was done because of the good condition of bond terminals in the original installation of third rail in 1898, on which the bonds were treated in this manner.

The structure, track and stations were designed and constructed under the direction of C. V. Weston, then chief engineer of the company. The additions to the power house, feeder system and storage battery installations were planned and constructed under the supervision of Sargent & Lundy as consulting engineers.

INCREASED FARES IN MASSACHUSETTS.

In last week's issue of the Electric Railway Review letters were published from officials of electric railways in Massachusetts bearing on the movement to increase fares in that state. Additional statements have been received as follows:

Taunton & Pawtucket Street Railway Company.

Arthur C. Ralph, general manager Taunton & Pawtucket Street Railway, Taunton, Mass.: "Our property was started and operated for seven years on a fare of about one cent per mile, which has been found by actual experience, with the most rigid economy, to be insufficient to pay fixed charges and operating expenses. This state of affairs, of course, could not always continue, as we were not putting aside anything for depreciation or paying our stockholders anything on their investment. We finally decided to raise the fare to about 1¼ cents per mile, which was done on February 1, with, so far, quite satisfactory results. We did this by inserting another fare limit where we were carrying people between six and seven miles, most of the way through a sparsely settled community, for five cents. There has not been any great amount of fault found thus far and we believe there will not be, so long as we maintain our present and past good service. We think this is the situation: Keep cars and roadbed in good physical condition, cars clean and warm, and maintain a schedule upon which patrons can absolutely depend, and the price of the ride will not be seriously considered so long as it is within reason, but the minute the property gets run down physically and the schedule is irregular the road becomes unpopular, not only with the patrons of the road, but with its own employes, who will then turn in and help the public to give the road a 'black eye'; then attempt to raise the fares and every man, woman and child on the line will insist on making all the trouble possible. Street railways in Massachusetts have always had too low fares as a rule. We believe a fare should be regulated by distances, rather than a changeable unit. There is no doubt that a 5-cent unit is a convenient one from the standpoint of both the traveling public and the street railway and that people can be carried farther for five cents through a thickly settled territory than through a thinly settled one. It seems certain that a great many roads in this state must do something to increase their revenue, and that quickly, or go into the hands of receivers. Many of them had more burdens than they could carry, before the prices of supplies and labor advanced. Now they are showing a greater deficit each year and becoming physical wrecks besides. There is no state in the union that has a greater number of able street railway men, but they are unable to 'get blood out of a stone' or make 'water flow up hill.' Why not raise the fares by some means? Has any human being a valid argument against it?"

Gardner Westminster & Fitchburg Street Railway.

C. A. Jefts, superintendent Gardner Westminster & Fitchburg Street Railway, Gardner, Mass.: "On the line from Gardner to Fitchburg, over 14 miles, this company operates 11 miles, on which we charge 20 cents fare. The Fitchburg & Leominster Street Railway takes our cars on its line into Fitchburg, charging five cents additional fare, making 25 cents from Fitchburg to Gardner, with transfers at the Fitchburg terminal. We have not made any changes in fares yet and hope the conditions will be such that we will not have to make any. The fare is about the same as that of the average road running in an open country and seems to be satisfactory to all passengers. I am not sure in my own mind about an increased fare. It might cause enough decrease in riding to offset the increase in fare."

CAR DEFECT REPORT.

About the first of the present year, H. H. Adams, superintendent of shops United Railways & Electric Company, Baltimore, put into use the report blank shown in the accompanying illustration. It will be noted that this is a complete yet simple report on which, by means of check marks, the motorman can turn in a statement of the condition of his car. The report blanks are made into pads of convenient thickness. Each sheet of one of these pads comprises two blanks similar to that shown, one of which is backed with manifold carbon, so that it is a simple task to fold one half of a sheet over the other half and thereby obtain duplicate copies of each trouble report. Both copies are sent to the dispatcher, who immediately forwards the original to the shop foreman.

Form L. 22. Revised, 11-9-07

THE UNITED RAILWAYS AND ELECTRIC CO.
OF BALTIMORE.

MOTORMAN'S REPORT OF CONDITION OF CAR.

Car No. ——— *Date* ——— *190* *A M or P. M* *Line*———

Length of Detention *Min's* ——— *Place of Trouble*

Motorman ——— *No.* ——— *Conductor* ——— *No* ———

Make check mark thus ✓ opposite defect to be reported. If the defect cannot be easily located, give in addition particulars which will assist in locating trouble. Report to be made out in duplicate, and both copies sent to Dispatcher, who MUST immediately forward original to shop Foreman. In case the defect is such as to allow the car to remain in service, this Report must be handed in upon arrival at Barn.

1822 General Manifold Co., Pat. Jan. 14,1908, Jan. 6,1903.

United Railways & Electric Company—Motorman's Report for Car Defects.

The British Columbia Electric Railway of Victoria, B. C., is installing a complete water system for fire protection, using standard hydrants and nozzles, on its properties in that city, and has purchased from the Allis-Chalmers-Bullock Company at Vancouver an 8-inch 2-stage Worthington turbine pump direct connected to a 150-horsepower 2,200-volt three-phase 60-cycle Allis-Chalmers-Bullock induction motor, also an electrically driven dry vacuum pump.

PROPOSED DESIGN FOR A PAY-AS-YOU-ENTER CAR.

The accompanying engraving represents a design for a pay-as-you-enter car invented by Charles B. Price of Pittsburg, Pa. The design was patented on September 13, 1904, but was considered too radical by the street railway men to whom it was submitted at that time. The design presents a number of interesting features which are radically different from the pay-as-you-enter cars which have been used in Montreal and have recently been placed in successful operation in Chicago and Buffalo.

This car is designed to make the pay-as-you-enter plan one of easy and practical operation; to secure the collection of every fare and a sure accounting for each fare collected; and to provide a safe exit for every passenger directly under the eye of the conductor, thus relieving the motorman of the necessity of watching the passengers.

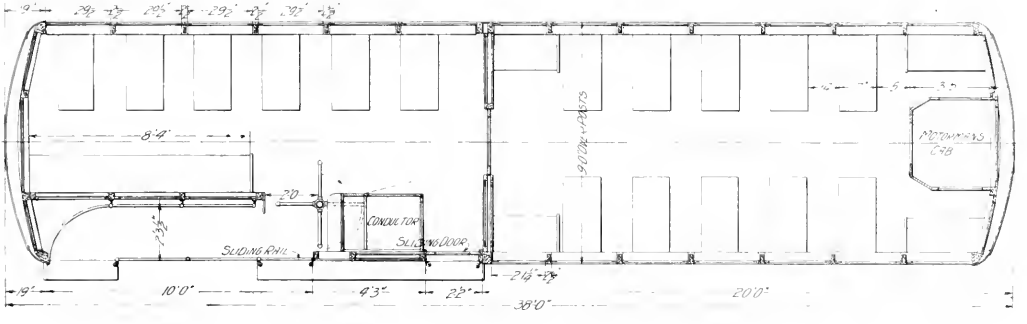
To effect the first of these objects, rear and front platforms are abolished and the only entrance to the car is by a side platform, not too wide, say 28 inches in width, and long enough to accommodate about 15 people or as many more as may be thought best. The pressure of one passenger back of another moves everyone forward toward the conductor, who is stationed in an inclosure near the center of the car.

The second object is gained by the passage of each person through a registering turnstile, controlled by the conductor, who, after the collection of each fare, pushes a spring bolt which releases the turnstile and allows it to make a quarter turn while the passenger enters the car, his fare being thus registered.

The third feature is the central exit, directly alongside the conductor's box. The departure of passengers thus proceeds simultaneously with the entrance of other passengers, neither conflicting with the other; and when all passengers have boarded or left the car the conductor, from his controlling position, can give a push button signal to the motorman.

Among other advantages is the possibility of abolishing the signal cords, which are now used to ring up fares and communicate with the motorman, and which are a frequent source of trouble with drunken and unruly passengers; also, the central entrance and central exit make it possible to divide cars into two compartments, one for smokers, if desired, or, in some localities, into white and colored compartments.

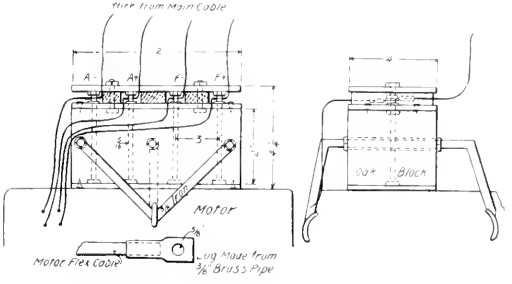
The central position of the conductor is claimed to be an advantage, inasmuch as he is in the best position to observe, and, if necessary, to regulate, his passengers. His box should have a sliding door opening on the street, so that he can readily move to the rear of the car when necessary to adjust the trolley or to the front of the car when necessary to personally flag a grade crossing of a steam railroad.



Design for a Pay-As-You-Enter Car with Side Entrance.

USEFUL MOTOR CABLE JUNCTION SCHEME.

The accompanying sketch shows a device used in the shops of the Consolidated Railways Light & Power Company, Wilmington, N. C., which does away with the former method of tagging, taping and untaping the four motor connections whenever a car has to be jacked up for truck removal. The troubles from grounded wires due to wear on the truck frame, motor casing and cuts from the side bearings are also done away with. The motor cable is neatly taped up to a junction box, where the wires spread out to receive their respective bolts or binding posts. The car cable wires are then led in on the other side of the motors, which makes it practically impossible to have any trouble from that source.



Method of Making Motor Connections.

The box is made of oak and the bolts are insulated with ¼-inch fiber, top and bottom. The lugs are simply pressed out of ⅜-inch brass pipe and stamped according to their respective wires from the motors and car cable, so that an apprentice can connect up a set of motors with no trouble. The useful junction scheme was designed and adapted for use in the shops of this company by F. B. Culp, master mechanic, and has been found to effect a considerable saving in both time and labor, with but little cost. The device is used on the Westinghouse Nos. 56 and 112 motors with advantage.

The Indiana Union Traction Company, which has been running a single car over the streets of Alexandria, has asked permission to abandon the service, leaving the people to depend upon the interurban cars. The city authorities and the people generally are opposed to this plan and assert that the interurban company is making such change on account of the claim of $1,000 against the company for damage alleged to have been caused to the mains of the municipal water plant by electrolysis, due to current escaping from the company's road.

News of the Week

Trial on Account of Charleston Interurban Accident.

Eight directors, officers and employes of the Central Illinois Traction Company were arraigned before the district court at Charleston, Ill., on February 24, charged with manslaughter and criminal negligence in connection with the collision on the Charleston-Mattoon interurban line on August 30, 1907, in which 18 persons were killed and a large number injured. The men who were indicted are: Judge Peter S. Grosscup, Arthur W. Underwood, Francis S. Peabody and Marshall W. Sampsell of Chicago, directors; President E. A. Potter of Chicago; Superintendent Fred Moore, Charleston; and B. F. McClara and Charles Botts, Charleston, the motormen of the two cars involved.

All of the accused pleaded not guilty and a motion was made to quash the indictments as faulty. The two principal counts on which the charge of criminal negligence is based are that the directors failed to prescribe adequate rules for the operation of the road and that they failed to exercise sufficient caution in the selection of employes. Levy Mayer of Chicago, attorney for the directors, argued the motion to quash the indictments and cited authorities to show that the duties of directors as required by law apply only to corporate powers and not to the physical management of the property. He held that the responsibility for the operation of a road rests with the executive officers in control and that the directors are not personally responsible in actions resulting from accidents. Arguments were also presented on Tuesday and Wednesday by counsel for the officers and for the employes. On Wednesday the state's attorney for Coles county made his address for the prosecution, holding that the directors are personally responsible and should take an active part in the management of the property. The arguments for the state were ended on Thursday and the case was again taken up by the defense.

Rapid Transit Affairs in New York.

William R. Willcox, chairman of the New York public service commission of the first district, has issued a statement in which he summarizes the work of the commission since July 1, 1907, as follows:

It has increased the service on the surface, elevated and subway lines from 7 to 60 per cent.

It has ordered a general overhauling of the surface car lines.

It has redrawn the original plans of the Fourth avenue (Brooklyn) subway, making it larger, and has completed plans for the sixth section of that work.

It has changed and enlarged the plans of the subway loop connecting the three bridges on the east side so that it corresponds to the Fourth avenue subway in Brooklyn.

It has completed plans for the Broadway and Lexington avenue and of the Canal street subways, making them fit in a general underground transportation system that is destined to cover the entire city.

With reference to new lines of transit it has completed such plans that if the board of estimate appropriates money for their carrying out there will be going on within four months three times as much subway work as has ever been under way at one time in this city.

The commission has adopted resolutions calling upon the New York New Haven & Hartford Railroad, which controls the New York Westchester & Boston and the New York & Port Chester franchises, to tell why the work on the Westchester road has been discontinued since 1906, when the work will be resumed, when the section from One Hundred and Seventy-seventh street to the city line will be completed and in operation and also the probable time of the finishing of the road from the city line to the Westchester terminal.

The engineers of the public service commission have announced that the extension of the Brooklyn subway from the borough hall to the Flatbush avenue terminal of the Long Island Railroad will be opened for operation about July 1.

August Belmont, chairman of the board, Theodore P. Shonts, president, and George W. Wickersham, counsel, of the Interborough-Metropolitan Company, held a conference with Chairman Willcox of the public service commission on February 20 in regard to the Belmont tunnel, owned by the New York & Long Island Railroad, which is controlled by the Interborough. The tunnel is ready for operation but the company has no franchise. Negotiations are now said to be pending for a purchase of the tunnel by the city and it was understood that the conference had to do with a conditional plan for operating the tunnel. Chairman Willcox has addressed a reply to a resolution of the legislature, asking what the commission had done toward opening the tunnel, in which he says: "If the New York & Long Island Railroad Company has forfeited its corporate rights and franchises, the commission is without present power to compel the operation of the tunnel, and, pending the final determination of the rights of the parties to the litigation, any attempt to do so would be premature and improper."

Comptroller Metz has announced that the city has no money to expend for subways in Manhattan and the Bronx at this time. He says that the city's available funds are all required for other public improvements that have been contracted for and that the city was committed to building the Fourth avenue Brooklyn subway, which would cost about $8,000,000 a year, before it started any other lines. In speaking to a delegation from the Bronx which advocated extensions of transit facilities, he said they ought not to expect the roads to build further extensions without charging an additional 5-cent fare, and that as soon as the people would agree to the additional fare additional lines would be forthcoming.

Holding Company Plan in Cleveland.

Several plans are under consideration for turning over the property of the Cleveland Electric Railway to the proposed holding company. If the pending negotiations result in a settlement it is planned that there shall be a consolidation of the Cleveland Electric Railway and the Forest City Railway, which may be brought about by an issue of Cleveland Electric Railway stock for the property of the Forest City Railway Company, then a renewal to the Cleveland Electric Railway Company of all franchises of both companies for a period of 25 years, at a rate of fare to be agreed upon, this renewal franchise being denominated in the negotiations a "security" franchise, and then, contemporaneously with the passing of the security franchise, a lease to the Municipal Traction Company, or other corporation, of all the street railway property of the city, at a rental of 6 per cent upon the value of all the physical property and of all the now existing franchises (not the security franchise) of the Cleveland Electric Railway Company. It is possible, however, that instead of a consolidation of the Cleveland Electric Railway and the Forest City Railway, or a purchase by the Cleveland Electric Railway Company of the property of the Forest City Railway Company, a new corporation to purchase the property of both companies will be formed, and a lease made by the new corporation to the Municipal Traction Company or other holding company, the stock of the new corporation being equal in amount to the value of the physical property and franchises.

Mayor Johnson and F. H. Goff reached an agreement on February 20 on a plan for ascertaining the average life of all the franchises within the city. A part of this general agreement was a concession by the mayor that the franchises affecting the East Fifty-fifth street line from Broadway, S. E., to the lake did not expire till 1914, in return for the concession by the company that the other portion of the line had no earning power beyond the date of expiration of the Hamm avenue grant. It was also conceded that the Burton line should be given no earning power beyond the date of expiration of the main grant.

Differences still exist on the length of life to be credited the portion of the St. Clair line now in the city, and also that of the Euclid main line. The mayor offered to concede half the time asked by the Cleveland Electric and also offered to allow the additional year on the Euclid Heights line alone. Neither proposition was accepted by Mr. Goff and it was finally decided to proceed with the computation and determine the differences in dollars and cents.

Legislation Affecting Electric Railways.

Virginia.—The legislature has passed and the governor has approved the bill repealing the law which prohibited the paralleling of the Richmond Fredericksburg & Potomac Railroad, and this leaves the way open for the building of the proposed Fredericksburg & Southern Railway, in which Frank J. Gould and others are interested.

New York.—The Wagner 5-cent fare bill, the purpose of which is to secure a single 5-cent fare from Brooklyn to Coney Island, N. Y., was recommitted to the assembly railroad committee on February 1 on the ground that the public service commission has jurisdiction over the matter.

District of Columbia.—The house of representatives on February 22 passed the bill permitting the Anacostia & Potomac River Railroad, the City & Suburban Railway, the Washington Railway & Electric Company and the Capital Traction Company to extend their tracks to the new union station. The bill requires the companies to issue universal transfers and gives the district commissioners authority to regulate the service of the roads. The Capital Traction Company is also authorized to build an extension into the northeast section of the city. An amendment requiring the companies to provide

separate compartments for white and colored passengers was defeated by a vote of 140 to 159. An amendment requiring the companies to establish 3-cent fares was also defeated. The senate has refused to concur on the house amendments to the bill and has appointed a conference committee.—Senator Gallinger and Representative Smith have introduced a bill, at the request of the district commissioners, which constitutes the commissioners as a public service commission, with full power to regulate the rates, service and capital issues of all public service corporations within the district. The principal provisions of the bill, as drafted by the corporation counsel of Washington, were published in last week's issue, page 244.

St. Louis Electrical Show.—The first St. Louis Electrical Show will be held in the First Regiment Armory April 18 to 25, 1908, under the management of the Trades Exposition Company, 618 Mermod and Jaccard building, St. Louis.

Jurisdiction of Chicago Municipal Courts in Personal Injury Suits.—The Illinois supreme court has rendered a decision that the jurisdiction of the municipal courts of Chicago in personal injury suits is not limited to cases involving amounts less than $1,000.

Kansas City Public Utilities Commission Plan Defeated.—The lower house of the Kansas City council on February 12 defeated an ordinance to provide for the appointment of a city public utilities commission, consisting of three members appointed by the mayor and two by the city council.

The Variable Speed Motor.—The Wisconsin branch of the American Institute of Electrical Engineers, Madison, Wis., held a meeting on February 27 at which J. B. Storey, engineer Northern Electrical Manufacturing Company, presented a paper on the "History and Development of the Variable Speed Motor."

American Institute of Electrical Engineers.—The Armour Institute of Technology branch of the American Institute of Electrical Engineers will, on March 12, listen to a paper on "Chicago Traction Problems," by R. H. Rice of the board of supervising engineers Chicago traction. On March 19 the programme includes a paper on "An Electrically Controlled Interlocking System," by E. W. Adams.

Discontinuance of Stops Sustained.—The federal court at Indianapolis has issued a perpetual injunction restraining the commissioners of Hancock county, Indiana, from interfering with the operation of the Indianapolis & Eastern Traction Company over the national road. The company recently discontinued several stops on the line and the commissioners ordered it to restore the stops under penalty of having the tracks and poles removed.

Decision on Manner of Alighting from Cars.—In a personal injury case against the Omaha & Council Bluffs Street Railway, in which the company's defense was that the woman was injured in stepping off a street car backward in direct violation of rules posted in the car, the supreme court of Nebraska has rendered a decision that it cannot take cognizance of the correct or incorrect manner of alighting from a car and that a passenger may alight in any way he chooses without prejudicing his right to recover damages.

The Suburban Railway Club.—The Suburban Railway Club was organized by officers and employes of the Boston Suburban Electric Companies of Newton, Mass., on January 6, for the purpose of promoting good fellowship and exchange of ideas among its members for the good of the service. On February 3 the club held a second meeting at Newton, at which the members were addressed by J. H. Neal, auditor of disbursements, and John Lindall, superintendent of rolling stock and shops, both of the Boston Elevated Railway.

Missouri Electric Light, Gas and Street Railway Association.—Charles Z. Pierson, secretary, St. Charles, Mo., writes that the next meeting of the Missouri Electric Light, Gas and Street Railway Association will be held at the Marquette hotel, St. Louis, Mo., April 23 to 25, the date having been selected so as to give the members an opportunity to visit the first St. Louis electrical show, which will be held under the management of the Trades Exposition Company, April 18 to 25. The programme of the meeting has not yet been announced.

Recent Accidents.—It is reported that 15 passengers were injured on February 21 at Northboro, Mass., when a car of the Worcester Consolidated Street Railway jumped the track and struck a large tree.—On February 22 an interurban car of the Cambridge Power Light & Traction Company, while stalled on a trestle near Cambridge, O., because the trolley wheel had left the wire, was struck by a city car which was following at a high rate of speed. The forward car was badly wrecked and one passenger was killed and 15 injured.—In a collision between two interurban cars of the Inter-Urban Railway at Moran Junction, Ia., on February 25, the motorman and five passengers were injured. Defective brakes on the rear car, allowing it to collide with the car ahead, which was standing at the junction at Moran, are said to have caused the accident.

Illinois Traction System Trainmen Required to Pass Examination.—Employes of the Illinois Traction System, whose duties are connected with the operation of cars, will hereafter be required to pass an examination similar to that required by the steam railroads. The men at present employed are now being examined on their knowledge of the rules and of the car equipment and as to their hearing, eyesight and general physical condition, and all applicants for positions in the future will undergo similar tests. Schools of instruction are also being established.

Des Moines Franchise Case.—Judge Howe of the Iowa state court at Des Moines has handed down a decision in the quo warranto cases brought by the civic league, that the Des Moines City Railway must file an answer within 30 days showing what franchise it is operating under. The decision of Judge McPherson of the United States district court that the company's franchise is perpetual has been appealed to the supreme court. It is stated that the company will secure an injunction against Judge Howe's decision until the supreme court has passed upon the appeal.

Race Separation Law Causes Trouble.—Both the railroads and street railways of Oklahoma have met with difficulties in attempting to enforce the new law requiring the separation of white and colored passengers, which went into effect on February 16. The Muskogee Electric Traction Company has had trouble with the negroes, who have in many cases refused to accept the seats assigned to them and there has been considerable disorder. In Oklahoma City the Oklahoma Railway Company had trouble with the white people, who object to standing while there are seats in the negro section.

Continuation of Grade Crossing Permits.—The Massachusetts railroad commission has granted a continuation of the permit whereby the Holyoke Street Railway maintains a grade crossing with the Boston & Maine Railroad at Race street, Holyoke, to December 1, 1909. Similar extension has been granted the Old Colony Street Railway, crossing the New York New Haven & Hartford Railroad at Central street, East Bridgewater, and Dean street in Taunton. In addition to previous conditions the board now requires that the companies shall notify it seasonably of any substantial increase in the traffic over the crossings.

Hudson River Tunnel Opened.—In accordance with the plan announced in our issue of last week the north tunnels of the Hudson & Manhattan Railroad were officially opened on February 25. At 3:40 p. m. a train of eight cars, bearing officials and guests of the company, some 800 in number, and including the governors of New York and New Jersey, left the New York terminus at a signal telegraphed from Washington by President Roosevelt. At Hoboken there were appropriate exercises and in the evening a dinner at Sherry's concluded the official celebration. The first regular train left the New York terminus at midnight.

Central Electric Accounting Conference Committee.—M. W. Glover, chairman of the Central Electric Accounting Conference, Cincinnati, O., has appointed the following committee to obtain samples of interline freight, ticket and claim account blanks in use on the different lines and to prepare recommendations as to the most suitable forms of blanks for use, the report to be presented at the next meeting of the conference. W. B. Wright, auditor Indianapolis & Cincinnati Traction Company; C. B. Baker, freight auditor Western Ohio Railway; T. C. Dodd, freight claim agent Terre Haute Indianapolis & Eastern Traction Company.

Attitude of Employes to the Public.—President John I. Beggs of the Milwaukee Electric Railway & Light Company delivered an address on Tuesday evening at a social meeting of the employes and their friends at the Public Service building. Mr. Beggs said that public sentiment regarding the company depends largely upon the kind of treatment the public is accorded by the employes, who necessarily reflect the attitude of the company itself and its management. "I appeal to the ladies present,' he said, "to inspire the workers in the employ of this company to render the company at all times cheerful, enthusiastic service." He told the men to believe in their employer or to leave, for, he declared, the company is absolutely dependent upon its employes for the treatment the public receives.

Specifications for Engines and Boilers.—On February 1 the Purdue branch of the American Institute of Electrical Engineers held a discussion on specifications for engines and boilers. Prof. C. H. Benjamin, who led the discussion, divided

specifications into two general classes. The first a general specification of size and type of machine to be supplied, which he called the owner's specification; the second, a more detailed specification made by the manufacturer of a machine he has to offer, and is known as builder's specification and may become the basis of a contract. The owner's specifications should be clear and be confined to indispensable qualifications. The contract in itself should be a simple affair and entirely devoid of technical language. It should state that the builder agrees to deliver at such a time and place a machine according to specifications and guarantee to operate satisfactorily, for which he is to receive payment in accordance with stated conditions. To become a contract this must be accepted by the buyer.

Wage Controversy in Des Moines.—It is reported that the wage controversy between the Des Moines City Railway Company and its employes is reaching a crisis. An arbitration committee composed of a representative of the company and a representative of the employes has had the question under consideration for several days without being able to agree and a list of seven names, presented by the men, from which to choose a third arbitrator, has been rejected by the company. The contract with the car men provides for an adjustment of the wage scale for the ensuing year on February 12. The men have demanded a scale of 23, 25 and 28 cents per hour for the three grades of employes, an increase of about 35 per cent, which the company considers exorbitant, considering the present business conditions. The executive committee of the car men's union has been given authority to call a strike at its discretion. The arbitration committee has been furnished statements of the company's financial condition and operating expenses in support of the claim that the company cannot increase wages at the present time.

Public Service Dinner of the American Institute of Electrical Engineers.—At the annual dinner of the American Institute of Electrical Engineers, held in New York on February 19, addresses were delivered by Theodore P. Shonts, president of the Interborough-Metropolitan Company, who spoke on "The Electric Railways and the Public"; Frederick Stevens, chairman of the public service commission of the second district, who spoke on "The State Control of Public Service, Past and Present"; and Walter C. Kerr, president of Westinghouse, Church, Kerr & Co., who spoke on "The Ethics of Public Service." Mr. Kerr said in part: "To be effective, public service commissions must be supported. To be supported they must be right. Public service is essentially a monopoly, and thus ethics must be based to a considerable extent on this premise. We may talk about competition all that we please, but in the last analysis it will be found that the evils of competition are, as a rule, greater than their benefits. For this reason we permit by franchise only a limited competition, and often we permit too much. Competition is a panacea to which the ignorant fly for help."

Minnesota Commission Wants Jurisdiction over Electric Roads.—The Minnesota railroad commission, in its annual report, recommends that its jurisdiction over electric railways be increased. The report says in part: "Under a recent decision of the supreme court, a certain character of suburban electric railway seems to be placed under the jurisdiction of the commission. In this connection it is contended by some authorities that the jurisdiction would not extend to that portion of the line within the corporate limits of any village or city. It will be apparent that supervision limited as this would limit it, would be entirely impracticable and useless. Undoubtedly these electric lines will in many cases be owned and operated by steam railways, and, in the judgment of the commission, the best interests of the state will be served by placing electric railways under the jurisdiction of the commission. We therefore recommend legislation to that end." The commission also recommends "that legislation be enacted requiring all parties who may desire to build extensions or new lines of railroads, regardless of the motive power to be used, to secure the written consent of the commission upon application setting out in detail the contemplated improvement and after public hearing, the object being to prevent the unnecessary duplication of roads or building of unnecessary lines."

An electric generator in a smelting plant at West Jordan, Utah, is said to have been in constant operation, 24 hours a day, for nearly four years and a half, with a single interruption, which was due to a broken pulley, for which the generator was in no way responsible.

The Chicago South Bend & Northern Indiana Railway is preparing to make improvements at its amusement park near Goshen, Ind., on the Elkhart river.

Traffic and Transportation

Bulletins for the Public in Baltimore.

The new policy adopted by William A. House, president of the United Railways & Electric Company of Baltimore, includes the publication of bulletins regarding the service in the advertising columns of Baltimore daily newspapers. These advertisements have attracted a great deal of attention from the public and have received favorable comment from the newspapers. In Bulletin No. 1 it was stated that "we are making friends with the people of Baltimore," and complaints and suggestions were invited. Bulletin No. 2 discussed the rush-hour problem in this way:

"We are always at work on this problem. We first increased our equipment to the maximum. We next doubled the carrying capacity of the cars themselves. Then we asked for the right to use German street. Now we start cars every day from all sections of the city up to the limit of the capacity of the congested streets, and timed to reach the crowded sections when the rush is on. Any further increase in the service on the lines operated on these streets would mean a blockade."

In Bulletin No. 3 the company said in reference to the transfer system:

"Before the various consolidations which resulted in placing the street railways here under one management, transfers were given only between lines of the same company, and some companies charged three cents for this privilege.

"Shortly after 1899, when the last consolidation took place, the legislature gave this company the right to charge five cents full fare and three cents for children throughout the city on the condition that free transfers would be given inside the city. The company put into effect a universal transfer system on July 1, 1900. Since that date the number of transfer points has grown steadily. By 1902 there were 142 transfer points, and by April 1, 1907, the number had increased to 186, an addition of 44 points. There are at present 195 transfer points, while the 'privileges of transfer'—i. e., the number of lines to which transfers may be had at these points—equals 1,622.

"Over 334,000,000 transfers have been used since this law went into effect. That is to say, about 40 per cent of all passengers take transfers.

"It is only fair that people should not ride twice for one fare, and reasonable regulations are necessary to prevent this. The only restrictions we make on the transfer privilege are such as are necessary for our own protection to prevent those economically inclined from getting a return trip at our expense. No fair-minded man can say that such restrictions are unreasonable. We know, however, that every arrangement is subject to improvements, and we have men at work constantly studying the transfer system.

"It is our business and intention to give you the best street car service that can be had, and we point to these figures as proof of what we have done in this most important particular. What we ask you to do is to read your transfer. If it is not good on a certain line, do not blindly censure us; think out the reason for yourself, and you will find, we hope, that in every case the reason is not an arbitrary one, but a matter of necessity for self-protection."

Illinois Traction System Makes Contract with Express Company.

The Illinois Traction System has made a contract with the United States Express Company providing that the electric railway shall transport over its lines business of the express company. B. R. Stephens, general traffic manager Illinois Traction System, in a letter regarding the contract, says:

"This contract goes into effect on April 1. The United States Express Company will handle its business via our lines. This does not mean that the express company will take over any of the business which we term express operated by the Illinois Traction System. The revenue under the contract is to be a percentage of the gross earnings, with a minimum amount guaranteed per year."

The American Express Company has closed a contract for handling its express business over the lines of the Ft. Dodge Des Moines & Southern Railroad, Ft. Dodge, Ia. The arrangement went into effect on February 18.

Changes in Service Approved by the Court.—Judge Lacombe of the United States circuit court, New York, has approved certain changes made in the operation of cars by the receiver for the Forty-second Street Manhattanville & St. Nicholas Avenue Railway. Judge Lacombe says that the receiver has decided to confine the service of its cars to its own lines, instead of using them to increase the service on the lines

of other roads. His road is now insufficiently supplied with cars, and by calling in cars from outside service he will be able forthwith to obtain better service on his own line, and he expects to still further increase that service with additional cars as soon as he can purchase them.

Fare to Coney Island.—The New York public service commission, first district, entered an order on February 21 requiring the Brooklyn Rapid Transit Company to show cause why the fare between Manhattan and Brooklyn and Coney Island should not be reduced from 10 to 5 cents.

Good Record at Ft. Wayne, Ind., During Snowstorm.—Although the fall of snow was extremely heavy at Ft. Wayne and between that point and Lafayette, Ind., during the blizzard of last week, the greatest delay the Ft. Wayne & Wabash Valley Traction Company experienced on any train was 50 minutes.

Complaint Regarding Brooklyn Rapid Transit Service.—The New York public service commission, first district, has issued an order requiring the Brooklyn Rapid Transit Company to answer the complaint of citizens that the service west of Luna park is defective and that to reach their homes people living there have to pay 15 cents fare or walk about a mile.

Brazil, Ind., Merchants Complain Regarding Fares.—Merchants of Brazil, Ind., have filed a complaint with the Indiana railroad commission concerning the rates of the Terre Haute Indianapolis & Eastern Traction Company. The bill charges unjust discrimination against the city of Brazil and in favor of Terre Haute. The commission is asked to readjust the rates.

Through Routes in Chicago.—Three of the through routes for which provision is made in the Chicago City Railway and the Chicago Railways Company ordinances will be established in Chicago soon. In order to facilitate the operation of cars on these routes the companies will use small cars temporarily. The large cars could not be used without considerable delay while subways under railways are being prepared.

Abuse of Transfers in Philadelphia.—In an endeavor to stop the abuse of the time limit on transfers the Philadelphia Rapid Transit Company has posted the following notice in its cars: "On account of abuse of transfer ticket privileges the public is hereby notified that conditions printed on such tickets will be strictly enforced, and in future conductors will be held accountable for proper issue and acceptance of transfer tickets."

Order Designed to Reduce Accidents.—The Fitchburg & Leominster Street Railway, Fitchburg, Mass., has recently announced an order which the management believes will minimize accidents to passengers leaving moving cars. The order provides that conductors, on approach to a stop, shall stand on the rear platform at the platform exit, facing the front, with left hand on front grab handle and right on the rear handle, preventing exit until the car stops. This order has been in effect several weeks and is working admirably.

Hearing on Petition to Carry Freight.—The Fitchburg & Leominster Street Railway, Fitchburg, Mass., was given a hearing on February 24 on its petition to carry freight in Lunenburg, by the selectmen of that town. There was a unanimous expression favoring granting the petition without any restrictions, save what may be exacted by the state railway commissioners. Final action will be taken at a regular meeting of the selectmen on February 29. If the petition is granted it is not unlikely that similar petitions will be presented in Leominster and Fitchburg.

Service in New Orleans.—Joseph H. Le Grange, vice-president New Orleans (La.) Railway & Light Company, has written a letter to Mayor Behrman of New Orleans in reply to a complaint regarding the service. The letter says that while some of the cars of the company do not present the appearance desired, financial conditions have prevented the company from buying new equipment and have made it necessary to repair the cars now in use. The directors, however, have directed the purchase of a large number of new cars, which will be obtained as soon as possible. Mr. Le Grange also states that the company now has in operation on all its lines more cars than are required by its franchises, and adds: "The public is perhaps not aware that each time the streets become flooded and electric cars are compelled to run through water reaching the motors, the armatures are burned out and the cars put out of service. On one particular occasion an unusually heavy rainfall during a short period of time put upward of 50 cars out of service and entailed heavy expense and inconvenience until the cars could be repaired and again placed in service."

Construction News

FRANCHISES.

Shelbyville, Ill.—The franchise granted two years ago to the Capital Circuit Traction Company, which proposed to build a line encircling Indianapolis, has been forfeited because the company failed to begin construction by February 20, 1908.

South Waverly, Pa.—The Sayre Railway Company, Sayre, Pa., has applied for a 37-year franchise to build and operate a single-track electric railway in South Waverly, Pa., to be completed and in operation by December 7, 1908.

INCORPORATIONS.

Shreveport Suburban Railway, Shreveport, La.—Incorporated in Louisiana with a capital stock of $50,000. John Lorenz, president; J. B. Atkins, secretary and treasurer. S. A. Guy, Shreveport, also is interested. Work already has been started on the line. The road will extend to Marshall, Tex. (Noted January 18.)

TRACK AND ROADWAY.

Bloomington Pontiac & Joliet Electric Railway, Pontiac, Ill.—H. A. Fisher, president, writes that this line will be extended this year from Pontiac to Chenoa, 10 miles, and possibly to Lexington, 9 miles farther south.

Boston Waltham & Western Electric Railroad, Waltham, Mass.—The Massachusetts railroad commission at a hearing last week considered arguments for and against the proposed plan of this company to build an electric railway from Waltham to Marlboro, Mass., 23 miles. The opposition urged that as the company proposed to buy power from the Newton Street Railway and would in other ways be governed by street railway conditions it was not included in the jurisdiction of the commission under the electric railway law of 1906. Charles E. Stevens is interested.

Calumet & Lac la Belle Traction & Power Company, Calumet, Mich.—E. K. Stewart, Calumet, Mich., general manager of this company, writes that construction work on its proposed line between Calumet and Mohawk, Mich., will be started as soon as the weather permits. (Noted January 18.)

Chicago South Bend & Northern Indiana Railway, South Bend, Ind.—We are advised that grading is practically completed on the extension of this line from South Bend to La Porte, Ind., 27 miles. The route includes the following towns: South Bend, Pine Lake, Lydic, New Carlisle, Terre Coupe, Rolling Prairie and La Porte. Samuel Riddle, general manager, South Bend, Ind. It is currently reported that the Murdock syndicate, controlling this company, is about to close a deal for the assets and franchises held by the Chicago-New York Electric Air Line Railroad. This would give the Murdocks possession of the franchises in Gary and enable the syndicate to carry out its long-contemplated plan of constructing a line from La Porte to Chicago and at the same time provide street railway facilities for the city of Gary.

Dallas (Tex.) Consolidated Electric Street Railway.—This company has applied to the board of commissioners of Dallas for a permit to lay a second track on Ackard street, between Jackson and Canton streets, and for several changes in switches and sidings.

Franklin, Pa.—Residents of the Sugar Creek valley, Pennsylvania, are desirious of securing an electric line to connect Franklin and Cambridge Springs, and it is stated that they would be glad to co-operate to this end in securing the necessary right of way.

Jefferson (Ia.) Interurban Railway.—Articles of incorporation are being prepared by this company for the purpose of building an interurban railway out of Jefferson. It is stated that 25 business men have subscribed $100 each for the expenses of preliminary surveys which are to be started at once.

Johnstown (Pa.) Passenger Railway.—It is reported that construction work is to be started soon on a 2-mile extension from Johnstown to Southmont, Pa. G. Nelson Smith, chief engineer.

Joliet & Southern Traction Company, Joilet, Ill.—H. A. Fisher, president, writes that this company's plans for construction work for the coming season are rapidly taking shape and that it is expected to finish the Blue Island extension from New Lenox, the present eastern terminus, through to

Blue Island and possibly to Chicago Heights, with a branch to Frankfort. It is also expected to build south from Joliet as far as Wilmington, a distance of 16 miles.

Lake View Traction Company, Memphis, Tenn.—H. E. Craft, vice-president, is quoted as saying that construction on the line from Memphis to Lake View will be started early in April. The line to Clarksdale, Miss., will not be undertaken until after the completion of the first portion of the line.

Little Falls, Minn.—F. E. Cawley, Minneapolis, Minn., is said to be promoting an electric railway from Little Falls to a point south of Gregory, Minn., on the Minneapolis St. Paul & Sault Ste. Marie Railway, about seven miles.

Matamoras & Santa Cruz Railway.—It is reported that a St. Louis syndicate headed by S. W. Fordyce has purchased this 3-mile horse car line, running from the ferry on the Rio Grande river oppposite Brownsville, Tex., to Matamoras, Mexico, and will electrify it. It is also stated that the syndicate will build a bridge across the river.

Milwaukee & Fox River Valley Railroad, Fond du Lac, Wis.—This company has filed amended articles of incorporation making a change in its proposed route. It is now proposed to build from Milwaukee through the counties of Milwaukee, Washington, Ozaukee, Sheboygan, Manitowoc, Calumet, Winnebago and Ontagamie to Appleton, Wis., with a branch from Fond du Lac northeasterly through the counties of Fond du Lac and Calumet, Wisconsin. John Saemann of Sheboygan is president. (Noted December 28, 1907.)

Mogollon, N. M.—It is stated that the Ernestine Mining Company of Mogollon is planning to build an 8-mile electric line for the purpose of hauling lumber from a new lumber district which it intends to develop in that section. E. Craig, president.

Muskogee (Okla.) Electric Traction Company.—This company expects to place contracts within the next few weeks for the construction of 2½ miles of track. R. D. Long, general manager, Muskogee, Okla.

Oklahoma Railway, Oklahoma City, Okla.—Announcement is made that this company has completed its 8-mile extension to Britton, Okla., and will begin operating cars this month. It is stated that the company now proposes to extend its line from Britton to Edmond, five miles, and later to Guthrie, 16 miles. John W. Shartel, vice-president. (Noted November 9, 1907.)

Oley Valley Railway, Reading, Pa.—Announcement is made that this company intends to complete an extension between Boyertown and Pottstown, Pa., about nine miles.

Peninsular Railway, Bartow, Fla.—It is announced that this company has secured additional right of way for a proposed 37-mile extension to Tampa, Fla. The company has built eight miles of electric line from Bartow to Mulberry and it is proposed to begin work on the new line in a short time. W. H. Evers, Bartow, Fla., is chief engineer.

Pittsburg Canonsburg & Washington Electric Railway, Pittsburg, Pa.—Contracts for grading have been let for the construction of this proposed line as follows: From East Canonsburg to Van Eman, two miles, W. H. Murdoch, Pittsburg; from Thompsonville to Clifton, 1½ miles, W. J. Payne & Sons, Pittsburg; from Clifton to Castle Shannon, two miles, Samuel Gamble, Carnegie, Pa. Bridges are to be built at East Canonsburg, Van Eman, Thompsonville and Clifton. The line will be built from Washington, Pa., to Pittsburg, by way of Canonsburg, Thompsonville, Castle Shannon and West Liberty, a total distance of 31 miles. The company is a subsidiary of the Pittsburg Railways. Grading was started in November, 1907. F. Uhlenhaut, president.

Pittsburg Lisbon & Western Railroad, Pittsburg, Pa.—It is reported that this company contemplates the extension of its road from Darlington, Beaver county, and also intends to electrify its line for the entire distance from Lisbon, O., to the Beaver valley, where a connection will be made at Morado with the proposed New Castle & Beaver Falls Electric Railway, thus giving connection with New Castle and Youngstown. N. B. Billingsley, president, Lisbon, O.

Sioux City Traction Company, Sioux City, Ia.—It is stated that this company will relay about four miles of track in the near future. (Noted July 20, 1907.)

Toronto (Ont.) Railway.—The city of Toronto has made application to the Ontario legislature for an act to amend the acts respecting the Toronto Railway, so as to make it clear that the company has not the right to lay tracks on the Toronto streets without the city's consent. This has been brought about by a long course of litigation between the city and the company, through all the Canadian courts to the judicial committee of the privy council.

United Traction Company, Reading, Pa.—It is stated that this company is planning to build an extension from Womelsdorf to Myerstown, Pa., during the coming year, by which a direct route from Reading to Harrisburg by trolley will be afforded. Walter A. Rigg, general manager, Reading, Pa.

Vincennes Traction & Light Company, Vincennes, Ind.—This company is said to be contemplating an expenditure of about $100,000 in improvements to its property. George E. Henry, general manager, Vincennes, Ind.

Wabash Valley Railroad.—It is reported that this company, which recently was organized to build an interurban railway in Illinois and Indiana, will begin construction in the spring. It is intended to operate the line with gasoline electric motors. It will serve the following towns: Danville, Ill.; Clinton, Newport, Hillsdale, Cayuga and Perrysville, Ind., with a possible connection later with Terre Haute. D. C. Johnson, Clinton, Ind., president; W. S. Lewis, Clinton, vice-president; B. S. Aikman, Newport, Ind., secretary; H. B. Davis, Newport, treasurer. (Noted January 11.)

Warren-Bisbee Railway, Bisbee, Ariz.—It is reported that this line, which now connects Warren and Bisbee, Ariz., a distance of five miles, will be extended to Douglas, a distance of eight miles.

Wichita (Kan.) Railroad & Light Company.—This company expects to double-track about three miles of its line during the coming summer. The old single track is to be removed and relaid with 60-pound 6-inch T-rails. H. E. Chubbuck, general manager, Ottawa, Ill.

Winona Interurban Railway, Winona Lake, Ind.—It is reported that this company is preparing to extend its track in Goshen, Ind., north on Ninth street to the factory district.

POWER HOUSES AND SUBSTATIONS.

Bowling Green (Ky.) Railway.—It is reported that this company is building a new power station. H. D. Fitch, general manager, Bowling Green.

Chicago & Joliet Electric Railway, Joliet, Ill.—We are officially advised that the report published in our issue of February 1, 1908, page 163, that this company proposed to erect a new power station and install new apparatus in several of its substations is entirely incorrect, as the company has no such plans under contemplation.

Indianapolis Columbus & Southern Traction Company, Seymour, Ind.—A. A. Anderson, general manager, writes that it is planned to install a 1,000-kilowatt generator in the power station at Edinburg, Ind., and to put in new substations at Southport and Franklin, dispensing with the one now in operation at Greenwood, which will give an improved distribution of power.

Mobile (Ala.) Light & Railroad Company.—The new power house of this company at Mobile, Ala., is now nearing completion. It will be equipped with a 1,200-kilowatt generator, driven by an Allis-Chalmers Corliss engine, operating condensing on steam at 160 pounds pressure. An overhead system of coal handling will also be installed.

Port Arthur (Ont.) Electric Street Railway.—The city council has completed arrangements with the Kaministiquia Power Company for a supply of 700 horsepower, to be used for lighting and for the operation of the municipal street railway.

United Traction Company, Reading, Pa.—This company is said to be planning the addition of water and steam driven units to its power station at Klapperthal, Pa., so that the operation of the plant will not be affected by low water conditions. Walter A. Rigg, general manager, Reading, Pa.

Wausau Street Railroad, Wausau, Wis.—We are advised by Neal Brown, president, that this company expects to develop a large water power in the vicinity of Wausau, the rights for which it has recently purchased from the Joseph Dessert Lumber Company. The power site is known as the Mosinee water power located in the village of Mosinee, 13 miles south of Wausau. It will develop this power very soon and, in addition to what is used for the operation of its railroad, expects to have a large surplus for sale. It will develop and sell this power electrically at prices ranging from a minimum of $15 per horsepower per year upward. The company expects to engage in an extensive canvass for customers who will build manufacturing institutions and use this power. Money for the development of power has been raised. The Mosinee water power has 4,000 miles of the Wisconsin river drainage area tributary to it.

Personal Mention

Mr. H. C. Green has resigned as superintendent of the Muncie & Portland Traction Company, Portland, Ind.

Mr. S. E. Mahan has resigned as assistant claim agent of the Twin City Rapid Transit Company.

Mr. Hugh McCloskey has been elected chairman of the board of directors of the New Orleans (La.) Railway & Light Company.

Mr. H. A. Fisher of Joliet, Ill., has been elected president of Bloomington Pontiac & Joliet Electric Railway, which was acquired last fall by the Fisher interests.

Mr. George Keegan, secretary of the American Street and Interurban Railway Manufacturers' Association, was married on February 20 to Miss Mary Cecilia Brennan of New York City.

Mr. George Fielder, general manager of the Chatham Wallaceburg & Lake Erie Railway, Chatham, Ont., has resigned. He will be succeeded by Mr. D A. Gordon, M. P., of Wallaceburg, Ont.

Mr. John J. Cleary has been elected treasurer of the Escanaba (Mich.) Electric Street Railway, succeeding Mr. John K. Stack, who has been elected president to succeed Mr. A. R. Moore, resigned.

Mr. H. B. Ritz has been appointed passenger agent and manager of Myers Lake park at Canton, O., controlled by the Northern Ohio Traction & Light Company of Akron, O. He succeeds Mr. W. D. Harris.

Mr. H. E. Farrington, formerly master mechanic of the United Railroads of San Francisco, has been appointed superintendent of car repairs of the Boston & Northern Street Railway, with headquarters at Chelsea, Mass.

Mr. Frank M'Coy has been appointed general manager of the Allegheny Valley Street Railway and the Allegheny Valley Light Company at Tarentum, Pa. Mr. M'Coy formerly represented the St. Louis Car Company at Pittsburg, Pa.

Mr. Arthur L. Smith, whose resignation as superintendent of the Central Kentucky Traction Company and the Lexington Railway was announced in our issue of January 11, has accepted a position with the Cincinnati Northern Traction Company, Cincinnati, O.

Mr. James L. Sullivan of Worcester, Mass., has been appointed purchasing agent of the Berkshire Street Railway, succeeding Mr. Richard T. Lawless. Mr. Daniel E. Burgess will succeed Mr. George R. Scarritt, whose resignation on February 1 as roadmaster of the company was announced in our issue of February 8.

Mr. Thomas Green has been appointed superintendent of the Cincinnati Newport & Covington Light & Traction Company, Covington, Ky., succeeding the late James R. Ledyard. Mr. Jefferson Mains has been appointed general foreman and in this capacity will discharge some of the duties heretofore assigned to the superintendent.

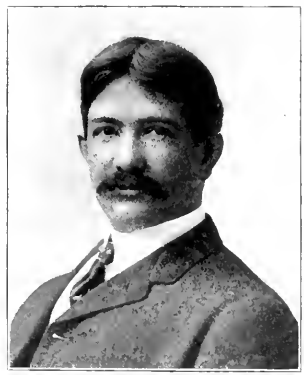
Mr. J. M. Andrew was elected president of the Indianapolis & Louisville Traction Company, Louisville, Ky., at the annual meeting of stockholders and directors, held in Scottsburg, Ind., several days ago. He succeeds Mr. John C. Mayo, who was elected chairman of the executive committee. Mr. James C. Chaplin was elected first vice-president to succeed Mr. John E. Greeley, who was made assistant to the president. The other officers were re-elected.

Mr. J. C. Huston has been appointed superintendent of the Detroit Monroe & Toledo Short Line Railway, effective at once, with headquarters at Monroe, Mich., succeeding the late Murdock McAulay, whose death occurred on February 11. Mr. Huston formerly was a conductor on the Detroit Ypsilanti Ann Arbor & Jackson Railway, and more recently has been car house foreman of the Detroit Monroe & Toledo. Mr. Fred M. Benson, who has been conductor on the line since it began operation, has been appointed assistant superinteudent with headquarters at Monroe.

Mr. W. G. Meloon, general manager of the Atlantic Shore Line Railway at Portsmouth, N. H., has resigned to accept another position with A. H. Bickmore & Co., New York City, the present owners of the property. Mr. Meloon's retirement is due to the ill health of his wife, who is obliged to seek another climate, and it is understood that he will become associated with one of the southern or western properties of the company. Mr. Meloon came to Portsmouth several years ago as superintendent of the old Portsmouth Kittery & York electric road, serving through four successive changes in ownership, and has been instrumental in its development from a comparatively small road to its present system of over 100 miles of track, controlling the Portsmouth Dover & York Street Railway, which is a consolidation of the Berwick Elliot & York, Portsmouth Kittery & York and the Kittery & Elliot Street railways.

Mr. George W. Brine, who recently was elected vice-president and general manager of the Georgia Railway & Electric Company, Atlanta, Ga., has been connected with electric lighting and railway properties since 1890. He was born in Cambridge, Mass., on September 9, 1867. In 1890 he accepted a position as assistant bookkeeper for the southern district of the Edison General Electric Company, with headquarters at Atlanta, Ga. He retained this position until the consolidation of the Edison General Electric Company and the Thomson-Houston Electric Company into the General Electric Company, when he went to New York and later to Boston, in the employ of the new company. He returned to Atlanta in 1892 as auditor of the southern office of the General Electric Company, and on January 15, 1894, he resigned to become cashier of the Georgia Electric Light Company, later being elected secretary-treasurer and manager. In April, 1902, when all of the railway and lighting properties of Atlanta were consolidated Mr. Brine was elected vice-president, treasurer and manager of the electrical department of the Georgia Railway & Electric Company, into which the old companies were merged, which position he held until his recent election as vice-president and general manager. Mr. Brine is also president of the Atlanta Gas Light Company.

Mr. Harold U. Wallace has resigned as president of the Wallace-Coates Engineering Company, Chicago, Ill., to become general manager of the Chicago Lake Shore & South Bend Railway, a new high-speed single-phase line that is now being completed between South Bend, Ind., and Kensington, Ill., at which point it connects with the Illinois Central Railroad. Mr. Wallace was born on November 15, 1872. He was educated at the Chicago Manual Training School and at Purdue University. He entered railway service in 1888 and from January 1, 1894, to March, 1905, was connected with the Illinois Central Railroad in various capacities in the engineering and transportation departments, from April, 1900, to September, 1902, as division superintendent, and from September, 1902, to March, 1905, as chief engineer. He then left the Illinois Central to engage in the contracting business and was connected with Thomas Phee & Co., railroad contractors, of Chicago, until July, 1905, when he was made third vice-president of J. G. White & Co. of New York. For the past two years he has been president of the Wallace-Coates Engineering Company. Mr. Wallace is a son of Mr. John F. Wallace, formerly chief engineer of the isthmian canal commission. He is a member of the American Railway Engineering and Maintenance of Way Association, the Engineers' Club of Chicago and the Engineers' Club of New York.



Harold U. Wallace.

Mr. J. P. Clark, whose appointment as assistant to President M. W. Mills of the Michigan United Railways, Jackson, Mich., was announced in the Electric Railway Review of February 22, 1908, has been engaged in the construction and management of street and interurban railways for the past 18 years. His railway experience dates from 1890, when he was appointed manager of the West Side Street Railway of Kansas City, Kan. In 1895 he went to Tacoma, Wash., as general manager of the Tacoma Traction Company. During his connection with this company Mr. Clark had charge of the rebuilding of the property and electrifying the steam road operated at that time in connection with the traction company's line. He then became manager of the Seattle Traction Company, Seattle, Wash., and later, when all of the lines of that city were consolidated, Mr. Clark had charge of their reconstruction. He resigned from this position to become

general manager of Stone & Webster's Terre Haute Electric Company, with charge of the city and suburban lines and lighting plants. In January, 1903, he was transferred to the Dallas property of this company as general manager of the Dallas Electric Corporation. In October, 1903, he was appointed general manager of the Ft. Wayne & Wabash Valley Traction Company, resigning shortly after to superintend the construction of a branch line for the Indiana Union Traction Company from Marion to Huntington, Ind. After completing this work he was appointed chief engineer for the executive committee of the Bergen County Gas & Electric Company of New Jersey, in the construction and organization of this property. He later engaged as western manager and chief engineer for W. N. Coler & Co. of New York City. Since that time Mr. Clark has served as general manager of the Jackson Consolidated Traction Company and as general manager of the Detroit Ypsilanti Ann Arbor & Jackson Railway.

Mr. S. W. Huff, whose election as president of the Coney Island & Brooklyn Railroad, Brooklyn, N. Y., to succeed Mr. J. L. Heins, was announced in our issue of February 22, is a native of Virginia and a graduate of the electrical engineering department of Cornell University. He has been connected for a number of years with various electric railway companies throughout the east, south and west, his first work having been with the Union Railway Company of Richmond, Va. In 1891 he was appointed assistant superintendent of the Baxter Electric Motor & Manufacturing Company of Baltimore, Md., where he remained until his appointment as general manager of the street railway lines at Raleigh, N. C. Two years later he returned to Baltimore as general superintendent of the Baxter company and later was appointed electrical engineer of the Columbia & Maryland Railway Company, which was engaged in the construction of a line between Baltimore and Washington. Upon the consolidation of the railway lines in Baltimore Mr. Huff was appointed master mechanic of the United Railways & Electric Company, subsequently being promoted to electrical and mechanical engineer. He was afterward engineer and operating expert for the syndicate controlling the San Francisco street railways and later became general manager and acting president. In July, 1902, he was appointed general manager of the railway department of the Virginia Passenger & Power Company at Richmond, Va., in charge of its Richmond and Manchester lines and later was appointed general manager of the company, with entire charge of its railway lines, light and power departments, where he has since remained.

S. W. Huff.

OBITUARY.

Thomas Carson Barr of Orange, N. J., for the past 20 years associated in the development of street railways in New Jersey, died at his home in Orange on February 26 from Bright's disease, aged 50 years. In 1889 Mr. Barr became interested in the street railways of Newark, N. J., having previously been president of the People's Passenger Railway, Philadelphia, Pa. With other capitalists he purchased all the Newark lines with the exception of the South Orange avenue line, incorporating them into the Newark Passenger Railway Company, which later was changed to the Consolidated Traction Company and still later to the North Jersey Street Railroad, of which the Public Service Corporation is the present owner. He was for a time associated with the Worcester, Mass., street railway properties, but returned to New Jersey, where he was elected president of the Elizabeth Plainfield & Central Jersey Railway. At the time of the organization of the Public Service Corporation Mr. Barr was made a director of the company.

S. F. Angus, who formerly was prominently identified with electric railway work, died at Detroit, Mich., last week. He was one of the promoters and chief owners of the Toledo Fremont & Norwalk Railroad, now a part of the Lake Shore Electric Railway, and the Detroit Ypsilanti Ann Arbor & Jackson Railway, now the Detroit Jackson & Chicago Railway.

Financial News

Chicago Railways Company.—The Northern Trust Company, the Harris Trust & Savings bank and the Merchants' Loan & Trust Company of Chicago have offered for sale $2,500,000 of first mortgage 5 per cent bonds at 93½ and interest. The earnings of the lines comprised in the system were as follows in 1907: Gross earnings, $10,538,822.09; operating expenses, including taxes, $7,654,419.13; net earnings, $2,884,402.96. The capitalization comprises $100,000 capital stock, upon which participation certificates are based; the $5,000,000 first mortgage bonds which will be issued in 1908; and $37,500,000 consolidated mortgage bonds. In a letter to the underwriters of the bonds now offered for sale Henry A. Blair, chairman of the board of directors of the railway, says: "The company owns and operates, without surface competition, 303 miles, single track, on the north and west sides of the city, and under the terms of the franchise these properties will be reconstructed, re-equipped and maintained in a manner which will give to the 1,580,000 people in the territory served by the company the finest service that money and the best engineering ability can secure. The territory served is densely populated and is constantly growing, thus permitting very profitable extensions to the company's present system. In view of the extensive improvements to be made immediately to the company's property and opportunities for future development, largely increased earnings are confidently expected." The trust agreement under which the participation certificates are issued provides for the control of the company by the following trustees: A. C. Bartlett, Charles H. Hulburd, Albert A. Sprague, Chauncey Keep and Charles G. Dawes. During the life of the first mortgage bonds a "Finance" committee will have direct supervision of the finances of the company, vacancies in this committee to be filled only upon the written approval of the Harris Trust & Savings Bank, Chicago, trustee for the first mortgage bonds. The present personnel of the committee is as follows: Chauncey Keep, Henry A. Blair and B. A. Eckhart.

Cleveland Southwestern & Columbus Railway, Cleveland.—Gross earnings from operation in 1907 were $756,898, an increase of $111,048 over 1906. Operating expenses were $440,035, an increase of $76,178. Net earnings were $316,863, an increase of $34,870. Charges, etc., were $205,455, an increase of $26,203. The net income was $111,408, an increase of $8,667. The operating ratio in 1907 was 58.13 per cent, as compared with 56.33 per cent in 1906. Car-mile results compare as follows:

Per car-mile, cents—	1907.	1906.	Increase.
Gross earnings	25.43	24.35	1.08
Operating expenses	14.78	13.72	1.06
Net earnings	10.65	10.63	0.02
Deductions	6.91	6.76	0.15
Net income	3.74	3.87	*0.13

*Decrease.

Cleveland Electric Railway.—Gross earnings in 1907 were $5,731,056, as compared with $5,882,589 in 1906 and $5,303,086 in 1905. During more than four months of 1907 the company operated at an average fare of 3.6 cents, selling tickets at the rate of seven for 25 cents and issuing double transfers. These adverse conditions naturally affected the gross earnings.

Coney Island & Brooklyn Railroad, Brooklyn.—The New York public service commission, first district, has approved an issue of $30,000 bonds to meet the cost of 10 new cars.

Georgia Railway & Electric Company, Atlanta, Ga.—Gross earnings from all sources in 1907 were $3,309,341, as compared with $2,894,924 in 1906. Net earnings were $1,646,059 in 1907 and $1,467,073 in 1906. Fixed charges were $784,675, as compared with $635,637. Dividends on the preferred stock aggregated $120,000 in each year. Common stock dividends in 1907 amounted to $428,448, as compared with $390,949 in 1906. The surplus in 1907 was $312,936, as compared with $320,487.

Interborough Rapid Transit Company, New York.—The New York public service commission, first district, has approved the inclusion in the original cost of construction of approximately $190,000 of 4 per cent city bonds to be used to settle damage claims arising at the time the Park avenue subway tunnel was changed to the east side of the street. The holders of the bonds are not to market them for at least six months.

Lancaster & York Furnace Street Railway, Lancaster, Pa.—This company has reduced its capital stock from $280,000 to $170,000, and has issued $150,000 bonds.

New York-Philadelphia Company, Philadelphia.—Following the receivership of the subsidiary Camden & Trenton Railway of Camden, N. J., J. Kearney Rice was appointed receiver for the New York-Philadelphia Company by Judge Lanning of the United States circuit court at Trenton, N. J. Judge Lanning also appointed David F. Carver of Newark, N. J., receiver for two other subsidiary roads, the Trenton & New Brunswick Railroad and the New Jersey Short Line Railroad. The New York-Philadelphia Company was incorporated in New Jersey in 1904 and owned the entire capital stocks of the Trenton & New Brunswick and the New Jersey Short Line roads and a majority of the stock of the Camden & Trenton road. The latter leases the Trenton Terminal Railroad.

Northampton (Mass.) Street Railway.—The issue of $175,000 additional capital stock at 110 per share has been approved by the Massachusetts railroad commission. The proceeds will be used to retire floating debt.

Rochester (N. Y.) Railway.—Gross earnings in the quarter ended December 31, 1907, were $630,068, as compared with $580,030 in the corresponding quarter of 1906. Expenses were $569,713, as compared with $410,032. Net earnings were $60,355, as compared with $169,998. Total income was $62,851, against $179,663. After provision for charges there was a deficit of $43,252 in the 1907 quarter, as compared with a surplus of $77,893 in the 1906 quarter.

Twin City Rapid Transit Company, Minneapolis.—This company has sold to William A. Read & Co. of New York $1,000,000 of the joint 5 per cent consolidated bonds of the Minneapolis Street Railway and the St. Paul City Railway.

United Traction Company, Albany, N. Y.—Gross earnings in the quarter ended December 31, 1907, were $496,938, as compared with $472,974 in the corresponding quarter of 1906. Expenses were $352,449, as compared with $302,641. Net earnings were $144,489, as compared with $170,333. The final surplus after charges was $76,343, against $84,791.

West End Street Railway, Boston.—This company has sold $700,000 of 4½ per cent 15-year bonds, dated January 1, 1908, to a syndicate composed of Parkinson & Burr, Blake Brothers & Co. and E. H. Rollins & Sons.

West Penn Railways Company, Pittsburg.—Gross earnings in 1907 were $1,603,100, an increase of $193,607 over the previous year. Expenses were $841,767, an increase of $67,791. Net earnings were $761,333, a gain of $125,816. Charges amounted last year to $416,734. The final surplus after the payment of dividends on the preferred stock amounted to $207,099, an increase of $87,404.

Windsor Essex & Lake Shore Rapid Railway, Kingsville, Ont.—Shareholders will vote on March 2 on an agreement for the sale of $750,000 bonds, and the procuring of $60,000 to complete the railway to Leamington.

ELECTRIC RAILWAY EARNINGS.

Montreal Street Railway.

January—	1908.	1907.
Total earnings	$285,515.36	$271,956.42
Operating expenses	202,503.94	189,497.60
Net earnings	83,011.42	82,458.82
Total charges	45,955.10	40,165.13
Surplus	37,056.52	42,293.69
Expenses—Per cent of earnings	70.93	69.63

Northern Ohio Traction & Light Company, Akron, O.

January—	1908.	1907.
Gross earnings	$126,125.78	$125,191.09
Operating expense	81,892.36	79,581.26
Net earnings	44,233.42	45,609.83
Fixed charges	42,501.88	41,339.46
Surplus for stock	1,731.54	4,270.37

Dividends Declared.

Chicago City Railway, quarterly, 1½ per cent.

Grand Rapids (Mich.) Railway, common, quarterly, 1 per cent.

Northern Texas Electric Company, Ft. Worth, Tex., preferred, 3 per cent.

Rochester (N. Y.) Railway & Light Company, preferred, quarterly, 1¾ per cent.

Terre Haute (Ind.) Traction & Light Company, preferred, 3 per cent.

Whatcom County Railway & Light Company, Bellingham, Wash., preferred, 3 per cent.

The Municipal Traction Company of Cleveland is rebuilding a car for the purpose of making an experiment with the pay-as-you-enter method of fare collection.

Manufactures and Supplies

ROLLING STOCK.

San Antonio Traction Company, San Antonio, Tex., will buy 10 semi-convertible cars.

Bowling Green Railway, Bowling Green, Ky., is in the market for two single-truck cars.

Chicago & Southern Traction Company, Chicago, will purchase two express cars and one sprinkler.

Petaluma & Santa Rosa Railway, Petaluma, Cal., will buy 10 box cars and 5 flat cars within the next few weeks.

Illinois Valley Railway, La Salle, Ill., has purchased three center aisle open cars from the Danville Car Company.

New Bedford & Onset Street Railway, New Bedford, Mass., has bought an express car from J. M. Jones' Sons.

Quincy Horse Railway & Carrying Company, Quincy, Ill., has ordered one center aisle open car from the Danville Car Company.

Montgomery Traction Company, Montgomery, Ala., has ordered eight double-truck convertible cars from The J. G. Brill Company.

Portland Railway Light & Power Company, Portland, Ore., is building a double-truck passenger car, 40 feet long over all, in its own shops.

Galesburg Railway & Light Company, Galesburg, Ill., has placed an order with the Danville Car Company for six semi-convertible, semi-steel, double-truck cars.

New Orleans Railway & Light Company, New Orleans, La., at a recent meeting of the board of directors, authorized the purchase of a number of cars.

Winnebago Traction Company, Oshkosh, Wis., which was reported in the Electric Railway Review of February 8 to be in the market for new cars, will place an order for six.

Frederick W. Whitridge, receiver for the Dry Dock East Broadway & Battery Railroad and the Forty-second Street Manhattanville & St. Nicholas Avenue Railroad, was authorized on February 26 by Judge Lacombe of the United States circuit court to issue certificates to the amount of $100,000 for the purchase of 25 new cars for the Dry Dock East Broadway & Battery Railroad; also to issue certificates to the amount of $200,000 to pay for 50 new cars for the Forty-second Street Manhattanville & St. Nicholas Avenue Railroad.

Illinois Central Electric Railway, Canton, Ill., as reported in the Electric Railway Review of February 1, has placed an order with the Danville Car Company for two semi-convertible cars. The contract was closed January 25 and delivery is to be made by April 1. The specifications include the following details:

Seating capacity	44 passengers
Weight	About 34,000 lb.
Wheel base	4 ft.
Length of body	30 ft.
Over vestibule	41 ft.
Length over all	41 ft.
Width inside	7 ft. 3 in.
Over all	8 ft. 2 in.
Height inside	7 ft. 6 in.
Sill to trolley base	2 ft. 2 in.
Height track to trolley base	12 ft.
Body	Wood with steel lined side
Underframe	Wood and metal

Special Equipment.

Curtain material	Pantasote
Hand brakes	Peacock
Headlights	Anderson-Smith
Motors	4 G.E.-80
Trucks	Brill

SHOPS AND BUILDINGS.

Williamsport (Pa.) Passenger Railway.—Ernest H. Davis, general manager, writes that this company proposed building a new car house, but has postponed the plan until business conditions improve.

St. Louis Montesano & Southern Railway, St. Louis, Mo.—This company is reported to have purchased property near the St. Louis city limits on which to erect a passenger station and car house. C. A. Gutke, president.

Denver & Interurban Railroad, Denver, Colo.—This road has been issued a building permit for a brick and stone car house on Market street, between Twenty-second and Twenty-third avenues, Denver. The cost is estimated at $20,000.

TRADE NOTES.

Arthur West, formerly chief engineer of the Westinghouse Machine Company, Pittsburg, severed his connection with that company on January 31.

Western Electric Company, Chicago, at a meeting of directors in Chicago on February 19, elected J. I. Waterbury of New York and W. H. Miner of Chicago directors to succeed H. A. Halligan and J. W. Johnston, resigned.

Sterling-Meaker Company of Newark, N. J., is shipping 60 Sterling brakes to Bangkok, Siam. The same firm is also furnishing the New York City Railway with 100 Sterling fenders this week and will supply them with 150 more in the near future.

Wisconsin Engine Company, Corliss, Wis., manufacturer of Corliss steam, gas and pumping engines and air and gas compressors, has opened a branch office in the Candler building, Atlanta, Ga. Julius M. Dashiell has been appointed sales manager.

Weber Gas Engine Company, Kansas City, Mo., is building two 150-horsepower 3-cylinder vertical gas engines, to be direct connected to two 100-kilowatt generators, for the Kansas City & Olathe Electric Railway. These engines will be operated by gas from the company's wells.

J. A. Fay & Egan Company, Cincinnati, O., at its annual meeting elected the following directors: T. P. Egan, S. P. Egan, Clifford Egan, Frank Egan, L. G. Robinson, Rudolph Kleybolte, A. A. Faber, Joseph Rawson and John E. Bruce. Mr. Faber, treasurer, succeeded W. H. Doane, who resigned as a director. All the old officers were re-elected.

Flexible Mesh Rail Bond Company, 114 Woodard street, Ypsilanti, Mich., has appointed J. L. Millspaugh manager of the sales department, effective February 1. Mr. Millspaugh was for a number of years associated with the operating department of the Detroit Ypsilanti Ann Arbor & Jackson Railway and has a large acquaintance among railway men.

Frank R. Coates, formerly chief engineer of the Chicago Great Western Railway and more recently a member of the firm of Wallace-Coates Engineering Company, has become associated with the Stone & Webster Engineering Corporation, constructing engineer of Boston, Mass., and will have charge of the contracting department. His headquarters will be at 147 Milk street, Boston.

Quincy-Manchester-Sargent Company was reported in last week's issue as having removed its general offices from 90 West street, New York, to Plainfield, N. J. This is an incorrect statement in that the company has merely located the headquarters of the machinery department at Plainfield, the sales department still remaining at 90 West street, New York. The headquarters for the track department and for the car and engine department are in the Old Colony building, Chicago.

Southern Railway Supply Company, 417 Walnut street, St. Louis, Mo., has been incorporated with a capital stock of $5,000, fully paid. It has bought the good will and agencies of the H. F. Vogel Contracting & Railway Supply Company, and will conduct a railway supply business, paying particular attention to the electric railway field. Joseph A. Buse is president, Ered Kraushaar, vice-president, and J. F. Bartman, secretary and treasurer. Mr. Bartman was formerly manager of the H. F. Vogel Contracting & Railway Supply Company.

Chase-Shawmut Company, Newburyport, Mass., has placed upon the market the Shawmut rail bond protector, a device designed to protect both the soldered and plug type of bond from being sheared off by wagon wheels, damaged by paving stones or ballast, injured by track crews, and to discourage theft. This protector is made of heavy steel securely fastened to rail by means of bolts, which hold the fishplate in place thus making an application of the simplest nature. It is of such shape as to allow inspection of the bond without removal of the fishplates and can be applied to either new or old rails at a minimum cost without impeding traffic.

Allis-Chalmers Company, Milwaukee, Wis., has stocked and equipped two of the great machine shop units at the West Allis works, known as shops 5 and 6, for the building of large electrical machines, particularly those intended for direct connection to the various forms of prime movers which constitute a large part of the product of this company. Heretofore the large electric generators for driving by gas engine, steam turbine, water wheel or Corliss engine have been built exclusively at the company's works in Cincinnati, O. The construction of a part of these large machines in Milwaukee gives much needed room for the manufacture of motors, transformers and small generators at Cincinnati and does away with the former necessity of shipping heavy engine shafts to the electrical works, to be fitted and keyed to the rotors of engine type generators. On the other hand, the West Allis works are better equipped, through large experience in the building of big equipments, to handle the heavy parts. To indicate the type of work which has already been turned out at West Allis, shipment was recently made of two 2,000-kilowatt 6,600-volt 25-cycle three-phase alternators, which were sent to the Homestead works of the Carnegie Steel Company. These alternators are for direct connection to 42 by 54 inch Allis-Chalmers twin tandem gas engines, also products of the West Allis works. A third alternator was recently shipped to the central furnaces of the American Steel & Wire Company. This machine was a 1,000-kilowatt 13,200-volt 25-cycle three-phase unit, designed for direct connection to a 34 by 42 inch Allis-Chalmers gas engine. These three generators were the first to be completed and shipped from the new shops, and others, including a 6,500-kilowatt unit, will follow in rapid succession during the next few weeks.

Dossert & Co., New York, announce that they have received what is probably the largest order for terminal lugs ever used on a single installation in this country. The material is for use in the wiring of the immense terminal buildings at Cortlandt, Church and Fulton streets, New York, of the Hudson & Manhattan Railway Company operating the tunnels under the Hudson river, which have just been opened to the public. These terminals are all of the Dossert solderless type, comprising front connection, back connection, angle and swivel lugs, and range in size from 2,000,000 circular-mils down to No. 4 cable. Part of the order comes from the Westinghouse Electric & Manufacturing Company of Pittsburg, Pa., and is for lugs to be used on their fuse blocks, inclosed type, 61 to 600 amperes. Approximately 1,000 Dossert solderless lugs are required for the switchboards and panel boards of these great twin buildings.

William V. Dee, who was recently elected secretary and general sales agent of the G. Drouvé Company, Bridgeport, Conn., was for 16 years connected with The Railway Age. He recently acquired an interest in the G. Drouvé Company on terms which opened up an alluring prospect for a young man, so that, while his old associates in The Railway Age office were sorry to see ties of many years' standing severed, they rejoice at Mr. Dee's good fortune and join with all his friends in congratulations and good wishes. Mr. Dee is in every sense of the term a self-made man. He began his creditable career with The Age as an office boy. He was unusually precocious and learned his duties and duties higher up rapidly. His promotion began the moment he began work. From the position of office boy he soon graduated into a clerkship; then he became a solicitor of subscriptions; from that it was but a step to soliciting advertising, and almost before we knew it "Colonel" Dee was assistant manager of the New York office under a wise and fatherly preceptor, F. S. Dinsmore. At an age when many boys are coddled and spoiled Dee bore the responsibilities of a man. He cared for and in large measure supported a widowed mother with several children younger than himself and through it all he was always cheerful, faithful, loyal and manly. He has earned by conscientious hard work and persistence a success that is more than praiseworthy for a man of 25 years of age, and those who know him best know that he has hardly started up the ladder of success.

William V. Dee.

ADVERTISING LITERATURE.

Railway Specialty & Supply Company, Chicago, Ill.—Bulletin S-118, which supersedes S-147, is devoted to the arc lamp lightning arrester in its special application to signal apparatus.

H. W. Johns-Manville Company, 100 William Street, New York, N. Y.—A recently issued leaflet is devoted to asbestos

roll fire felt, which is especially recommended for use where insulation is required to resist very high temperatures.

Western Electric Company, 259 South Clinton Street, Chicago, Ill.—Bulletin No. 5352 is a neat and comprehensive publication showing a complete line of fan motors, practically all standard types of which are illustrated and described. The cover is both unique and handsome.

Weber Gas Engine Company, Kansas City, Mo.—Under the title of "Governors that Govern," a neat leaflet has been issued which answers the question, "Will a gas engine drive an electric generator and furnish steady light?" The ability of Weber gas engines to do this is graphically demonstrated by text and diagram.

Allis-Chalmers Company, Milwaukee, Wis.—Lighting transformers are described in Bulletin No. 1061.—A complete description of type K direct-current motors is contained in Bulletin No. 1057.—Information regarding compound engines, from the first and famous "Centennial" engine to present-day Reynolds-Corliss engines, is shown in Bulletin No. 1512.

Sprague Electric Company, 527 West Thirty-fourth Street, New York, N. Y.—Among recent publications are Bulletin No. 107, devoted to continuous-current direct-driven type S generators for lighting and power; Bulletin No. 224, describing type D direct-current motors; Bulletin No. 310 (superseding No. 301), exploiting direct-current motors for operating ventilating fans and blowers; Bulletin No. 507 (superseding No. 505), the subject of which is flexible steel-armored hose for steam or compressed air.

Murray Iron Works Company, Burlington, Ia.—An unusually handsome publication is Catalogue No. 60, recently issued. It is descriptive of Murray safety water tube boilers, the details of which are most carefully illustrated by a number of fine halftones and line drawings. Ten of the large pages show buildings of widely varying kinds located in different cities and equipped with Murray boilers. The introduction calls attention to the fact that the company has been in its present location for the past 38 years.

Universal Portland Cement Company, Chicago, Ill., and Pittsburg, Pa.—A recent bulletin shows views of a number of important structures built wholly or in part of Universal Portland cement. The most prominent is Montgomery Ward & Co.'s new Chicago building, located at Chicago avenue and the river, said to be the largest reinforced concrete structure in the world. The building covers approximately 3¼ acres, has eight stories and a basement, and 100,000 barrels of cement were used in its construction.

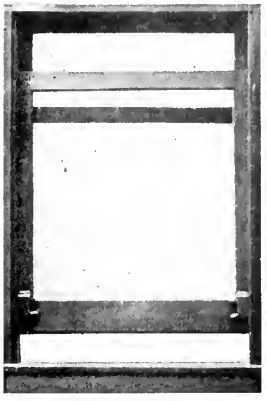
General Electric Company, Schenectady, N. Y.—Recently issued bulletins include No. 4544, the subject of which is continuous-current railway switchboards of the following types: Generator panels, including circuit-breakers and equalizer switch panels, rotary converter panels, feeder panels for one circuit, feeder panels for two circuits with one ammeter per panel, and feeder panels for two circuits with two ammeters per panel. The various forms of apparatus used in connection with the panels, details of construction, etc., are described and illustrated, and complete tables giving catalogue numbers, capacities, etc., and dimension sketches, are given.—Bulletin No. 4563 is devoted to an improved type of switch indicator known as the SI-104. It is neat in design, strong, weather-proof and insect-proof, and every possible precaution has been taken to insure reliable operation.—Bulletin No. 4558 describes a line of isolated plant switchboard panels with circuit-breakers. The panels provide for controlling 125-volt generators of from 5 to 120 kilowatt capacity, and 250-volt generators of from 10 to 240 kilowatt capacity, and are made for controlling from two to six feeder circuits.—Bulletin No. 4564 describes low-pressure air compressors rated from 0.88 to 4 pounds per square inch and from capacities of 750 to 10,000 cubic feet of free air per minute.

SHAWMUT AUXILIARY BOND.

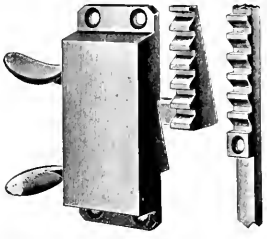
As a means of increasing the efficiency of plug and pin bonds the Chase-Shawmut Company, Newburyport, Mass., presents the Shawmut "Auxiliary" bond—a copper cap with rail-engaging flange filled with solder, heated and applied to end of bond, and thus by giving additional contact surface reducing to a minimum the resistance at the rail joint. A recent test made with "Auxiliary" bonds applied on new plug bonds just installed showed that an improvement of over 15 per cent in conductivity resulted. With a bond 15 per cent better than a new plug bond available, having the advantage of a permanent metallic union, as contrasted with pressure contact alone, the Chase-Shawmut Company believes that railroads will appreciate this means toward cost reduction.

GABA SASH RETAINER AND ANTI-RATTLER.

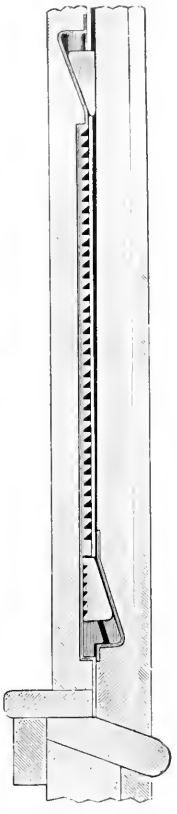
The accompanying illustrations show the mechanism of an improved sash retainer for use on car windows, patented by M. H. Gaba, and manufactured by the Patterson Tool &



Window Partly Raised.



Lock and Lock Strip.



Gaba Sash Retainer.

Supply Company of Dayton, O. With this arrangement the ratchets are inclosed in the window casing and do not show in the interior of the car, and this absence of rough surfaces improves materially the appearance of the car and at the same time makes it easier to keep the window casings clean.

The principle of the device is apparent from the sectional view and the engraving showing the lock separately. Pressing the thumb piece of the lock draws downward the triangular toothed member of the lock, which is guided by the lock casing and moved out so it can clear the ratchet strip. The sash being raised and the lock released, the toothed block meshes with the rack and holds the sash in place.

The weight of the sash coming on the inclined surface of the toothed block, the latter acts as a wedge to hold the sash against the outer casing, making the joint tight and preventing rattling. At the top a triangular block, shown in the sectional view, serves the same purpose. When the sash is lowered the wedge of the lock, actuated by a spring, is pressed up and holds the sash against the outer casing.

This device can be applied to any car without changing sashes or strips.

Arthur S. Partridge, 421 Olive Street, St. Louis, Mo.—Schedule No. 18, issued under date of February 27, is an attractive showing of a large number of generators and other electric railway machinery, together with a list of interurban and city cars, all ready for immediate sale and delivery.

NOVEL USE OF A SCREW PUMP BY NEW ORLEANS RAILWAY & LIGHT COMPANY.

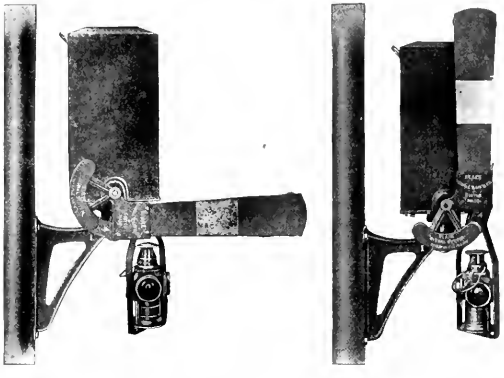
The new Claiborne station of the New Orleans Railway & Light Company, New Orleans, La., which recently has been extended and rebuilt, has among its many interesting features one which relates to the condensing apparatus and the means taken to prevent the sediment from the Mississippi river from being drawn into the condenser intakes.

Four 72-inch pipes have been provided to serve the condenser intake and discharge. They are all extended through the levee, three being installed under the boiler room and one placed under the railway tracks between the boiler room and the levee. The pipes are made in 30-foot lengths of ½-inch riveted steel, protected by a coating $\frac{3}{8}$ inch thick, applied by dipping the sections into a hot compound.

For the purpose of removing sand and silt from the water pipes water jets have been installed at 10-foot interyals in the bottom of the pipes, and by a system of valves the intake and discharge may be connected at the station end with an Allis-Chalmers motor-driven screw pump, so located as to secure a flow of from 8 to 10 feet per second through the pipes. When the cleaning is to be done the jets are first operated to loosen the deposit, which is then worked out by the flow from the pump. The pump is driven by means of a 700-horsepower 550-volt induction motor directly coupled to it. Messrs. Sanderson & Porter, engineers, New York City, were in charge of the design and construction of the power station.

BLAKE SIGNALS WITH OIL LIGHTS.

In order to meet the requirements of single-phase electric roads and steam railroads the Blake Signal & Manufacturing Company has developed the type of signal shown in the accompanying engravings. These signals are similar in every detail to the well-known Blake dispatcher's signals for telephone train dispatching, now in use on many 500-volt interurban electric roads, except the signal light for use after dark. On 500-volt trolley lines the most effective as well as simplest and cheapest method of getting the light for night use is to connect the 500-volt trolley or feeder to an incandescent lamp circuit through a certain amount of resistance, said circuit being closed by a substantial knife blade switch when the semaphore is set in the horizontal position. With single-phase lines or steam railroads this comparatively low voltage electric current is not available at the line signal and it becomes necessary to devise some other means for getting the necessary signal light for night use.



Blake Signals—Semaphore Blade and Lamp in Stop and Clear Positions.

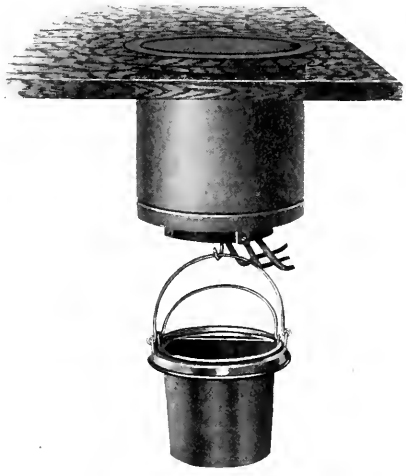
This has been accomplished by supporting a standard 4-lens railway switch lamp on a substantial hanger, the shaft of which goes up through the base of the signal. The end of this shaft is so connected with the semaphore shaft that when the semaphore drops to the horizontal position the lamp shaft and lamp are given a quarter turn so that where the lamp shows a white or green light up and down the track when the semaphore is in the vertical or "clear" position, it will show a red light up and down the track when the semaphore is set to the horizontal or "stop" position.

The weight of the hanger and lamp is supported on a spiral so that not only does the weight of the lamp assist, rather than retard, the dropping of the semaphore to the horizontal position, but should the rod or pin connecting the lamp shaft with the semaphore shaft be broken the lamp would of its own weight make a quarter turn and show a red light. This is on the side of safety and makes it impossible for the lamp to show anything but red when the semaphore is set at danger. As with all switch lamps, whether fork or socket type, it is impossible for a lamp to be put up showing the wrong light, that is, a light at variance with the position of the semaphore.

All of the working parts of this lamp hanger are under the signal cover, where they are thoroughly protected against the weather. It is this type of signal which has been furnished for the Annapolis branch of the Washington Baltimore & Annapolis Railroad, described and illustrated in the Electric Railway Review for February 15, 1908, page 200.

ELECTRICALLY HEATED GLUE POTS.

The Westinghouse Electric & Manufacturing Company is putting on the market a line of improved electrically heated glue pots that represent the application of electricity in the simplest and most convenient form. The pots are made in 2-quart and 4-quart sizes, in both portable and bench types. There is nothing to get out of order or to require any more attention than is given the ordinary glue pot.



Electrically Heated Glue Pot for Bench Use.

The pots themselves are of seamless drawn copper with brass bail and wiper rod. The water bath is made of seamless copper, and the heating element, which is wrapped around the lower portion, is inclosed in a water-tight tin envelope. The water bath is provided with a patent circulating device, which gives it the maximum heating efficiency. This device consists of a hollow ring, the lower end of which is closed by a diaphragm having a central opening. This confines the heating action to the thin film of water outside of the device, and sets up a rapid circulation in the water, which brings the glue up to the working temperature in a short time.

To further promote economical heating the pots are provided with heat regulating switches, by means of which the glue can rapidly be brought to the desired temperature, and then maintained there by a lower temperature of current.

A 4-quart portable pot is one of the sizes made. The illustration shows a bench pot with the cover in place, giving an unobstructed working surface on the bench. The glue pot and water bath are hung underneath, so as to be out of the way. When the pot is in use the cover is hung on the hook underneath the table.

Electrically heated dry glue pots are made for those industries where the water bath glue pot is undesirable.

It is reported that the Boise & Interurban Railway, Boise, Idaho, has purchased a 22-acre tract of land to be equipped for an amusement park. The new tract is on the interurban line of the company adjoining Pierce park. W. E. Pierce, president, Boise, Idaho.

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

An experienced business getter and manager would like to secure position as traffic manager for large electric system. Highest references. Address "No. 548," care of Electric Railway Review, Chicago.

Position as auditor wanted by a young man of experience in street railway and electric light accounting. Best of references as to character and ability. Address "No. 545," care Electric Railway Review, Chicago.

Position as auditor or assistant wanted by a young single man. Thoroughly experienced in railway, gas and lighting accounting. Now employed. Address "No. 544," care of Electric Railway Review, Chicago.

What can you offer young man with eight years' railway supply experience in sales department? Office or selling. Good correspondent. Unimpeachable reference. Address "No. 557," care of Electric Railway Review, Chicago.

Expert armature winder on all types of G.E. and Westinghouse motors is open for a position. Live, up-to-date man, capable of handling men. Excellent habits. A-1 references. Address "No. 552," care of Electric Railway Review, Chicago.

Position Wanted—Accountant and auditor thoroughly qualified to take full charge of office. Ten years' experience as auditor, bookkeeper and office manager. Can establish and maintain complete system of accounts. Street and interurban railway properties a specialty. Address "No. 554," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Superintendent operating 200-car city division of a well-known trolley system must change. Desire similar position with smaller system, where there would be opportunity to make friends for the line and increase traffic. Experienced in railroad and electric line organization. Age 34. References: Every former superior officer. Address "No. 555," care of Electric Railway Review, Chicago.

Experienced master mechanic desires position. Has thorough knowledge of high-speed electric railway equipment, on third rail or trolley. Is good executive, tactful and able to organize work of departments. Best of references furnished. Will consider position with high-speed interurban or city railway. Address "No. 550," care Electric Railway Review, Chicago.

Position by draftsman; have had nine years' experience in electric railway work, instrument work, mechanical and electrical drafting. Experience: assistant to master mechanic and inspector of car construction, equipment and maintenance; track work and buildings. Also familiar with operation. Thoroughly reliable. Address "No. 549," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Twelve offices, covering the entire street railway and manufacturing world. Positions open everywhere; office, sales and technical. Write today, HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Ask us about any book on electric railway and allied subjects. We publish some and sell all that are in print. The Wilson Company, 160 Harrison Street, Chicago.

Copies of the Street Railway Review of January and February, 1906, are wanted. Name condition and price. Address "No. 535," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

BUSINESS OPPORTUNITIES.

Exclusive sales agency wanted for Chicago and west for several street railway specialties. Appliances for cars only. Address "No. 556," care of Electric Railway Review, Chicago.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copy of the Electric Railway Review of January 12, 1907, in good condition. State price in your answer. Address "No. 530," care of Electric Railway Review, Chicago.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

If interested in any phase of steam transportation, you will find every development covered fully and accurately in The Railway Age. It is the leader and acknowledged authority in this field. Ask for free sample copies. The Railway Age, 160 Harrison Street, Chicago.

A copy of "The Motorman and His Duties," the standard handbook on the theory and practice of electric car operation, is worth many times its cost to every man interested in the subject. Send for 16-page pamphlet of sample pages. The Wilson Company, 160 Harrison Street, Chicago.

The "New Policy" in Baltimore.

A policy which should be successful has been adopted by William A. House, president of the United Railways & Electric Company of Baltimore. On January 8 the Baltimore News published an interview with Mr. House which was introduced by the statement that "because of the many expressions of approval heard during the past year" on the new policy of the company the reporter was prompted to ask what had led to the change. The tenor of the answer was that the most valuable asset a public service corporation can have is the good-will of the public. Mr. House showed what had been done to strengthen the right of the company to the favorable opinion of the people. In pursuance of this policy the company has recently printed advertisements in the daily newspapers relating to the service and the papers have called attention thereto by articles in their news columns and editorials. In the performance of its duty the electric railway makes impressions which materially affect its earnings and expenses. As an individual has very largely in himself the determination of the impression which he creates upon the minds of others with whom he comes in contact, so a corporation influences by its acts the opinions of people regarding it. The United Railways & Electric Company has already printed several bulletins designed to develop a fair-minded attitude on the part of the public. The substance of the advertisement relating to transfers was published in last week's issue of the Electric Railway Review, page 276. In this advertisement the company showed that it was performing a valuable public service by its liberal privileges of transfer.

The Spread of the Single Phase.

It is interesting to learn how extensively the single-phase system of current distribution for electric railways has been adopted in North America. M. N. Blakemore, in the February issue of the Electric Journal, presents a table showing general characteristic data on the single-phase electric roads in America. Thus we learn that there are 28 single-phase roads with a combined route mileage of 966.3 miles. If we take into account the fact that some of those roads have electrified two, three and even four tracks, a probably accurate estimate of the total mileage of single-phase electrically operated track would be 1,105 miles. Since the issue of the journal, earlier referred to, two single-phase roads, the Washington Baltimore & Annapolis and the Hanover & York railways, have begun operating. We therefore may readjust the totals as presented, thus finding that there are in operation 771.8 route-miles and under construction 194.5 route-miles of single-phase operated track. For the handling of passengers these roads require 240 cars, 162 of which, on 11 different roads, are equipped for combined alternating and direct current operation. There are also 57 electric locomotives used for freight purposes. The motive power equipment of the electric motors on these cars and locomotives has a total rated capacity of 137,400 horsepower. The alternating-current voltages carried on the trolley wires range from 1,200 to 11,000, a wide variation. The first single-phase road to be put in service was the Indianapolis & Cincinnati, which began operating in December, 1904, but little more than three years ago. Bearing in mind the shortness of its growing period and remembering that there are now or soon will be in operation more than 1,100 miles of single-phase operated electric railway track, the rapidity of the new system's growth is at once apparent.

T-Rail Replaces Grooved Girder.

For any but metropolitan railway track the grooved girder rail seems to have had its day. A striking example of how a city council, at first favoring the grooved rail, after a fair trial willingly authorized the use of high T-rail, is told by C. W. Kellogg, Jr., in the March Stone & Webster Public Service Journal. In the winter of 1906 and 1907 the El Paso Electric Railway endeavored to obtain permission from the city council to install T-rails. The city council did not differ from a thousand and one other city councils and therefore insisted that the grooved girder rail should be used in the paved districts. Under protest the railway company built the track with grooved rail. It is now in a position to say to the city, "I told you so." The grooved rail has grown into disfavor because of its noisiness. The city council is now convinced that the T-rail is most acceptable for tracks in the paved districts of El Paso, and so, on January 9, 1908, permission was granted the railway company to use T-rail in future paving extensions. The track substructure approved by the city comprises wooden ties embedded in concrete. These ties carry 80-pound T-rails 7 inches high with a 2½-inch head. Between the rails the concrete is filled in above the tops of the ties and given a surface of Bitulithic paving material. Special nose brick are not used, but vitrified paving brick are laid parallel with the rail, three in a row, with the edge of the inner row set under the head of the T-rail. This track substructure combines many desirable features and we predict that the T-rail therein used will give entire satisfaction to the city authorities.

Electrified Swedish Railways.

Without statements of total mileage and construction cost, which are placed at 1,300 and $50,000,000, respectively, it would hardly be possible to realize the extent to which the Swedish government will electrically equip its state railways. In the February issue of the Electric Trunk Line Age is presented a descriptive article outlining the proposed plans for this enormous electrification project. Practically the entire mileage controlled by the state between the southern end of the Scandinavian peninsula and a line across the peninsula 150 miles north of Stockholm will be equipped for single-phase operation at 15,000 volts. The trains to be operated, from our point of view, are light, hardly comparing in weight with most of the equipments operated on the American interurban lines; therefore the decision to use single-phase motors rather than direct-current or three-phase equipments is justified. Current for the operation of the electrified railways will be generated at water power stations, of which there are a plentiful number in Sweden. Wooden poles will be used to support the trolley brackets carrying the catenary overhead wire, and steel poles set in concrete will be used for the independent

transmission circuits. In the preliminary report are estimates of cost and depreciation that are particularly interesting when compared with similar quantities for railway construction and operation in America. Interest was put at 3.8 per cent; copper wire was estimated at 30 cents a pound for the transmission lines and 31 cents a pound for the hard-drawn contact wire, the depreciation charges being 0.7 per cent and 2.5 per cent respectively for transmission and contact lines. On account of the possibility of double-tracking before the present plans are entirely consummated in 1920, the poles carrying the trolley wire will have to be renewed in 10 years' time. This great project of electrifying 1,300 miles of operated railways is actually under construction and the execution of the work will undoubtedly bring forth a vast amount of data of value to engineers interested in the many electrical projects in America.

THE FUTURE OF THE INTERURBAN ROAD.

At a recent hearing in Boston before the legislative committee on street railways, Bentley W. Warren, counsel for the Boston & Northern Street Railway, presented an argument against a bill providing for privately owned elevated or subway lines, intimating at the close of the discussion that the trend of the times indicates that the coming electrification of steam railroads will obviate the needs of electric railroads; that it will be easier and cheaper to provide additional tracks for the electrified steam railroads than to build anew; and that the possession of great city terminals by the railroads will give them an advantage which the new interurban lines cannot hope to equal. There is no more interesting question in the transportation world than the future of the interurban railway in relation to the electrification of the steam roads.

In the main, the high-speed interurban railway development of the past has been confined to populous terminal cities, separated by thinly settled intermediary country, but there has lately come into existence a distinct demand for faster service in and between the cities and towns of the older communities of the east—a service that cannot possibly be given on the highways even with restricted stops. The possibilities of modern engineering are far from exhausted in the field of interurban rapid transit.

There is little question that the interurban line has come to stay. Each type of road fills a certain need of its own. The main issue is whether the electrified steam road, cooperating with the existing street railway development, can supply the class of service which at present the interurban lines are furnishing or are likely to furnish in the event of their construction in populous territory. A critical study inclines one to the belief that the existing steam railroad properties, serving sections that are thickly settled, cannot, even through electrification, provide the precise service of the high-speed electric interurban road. On the existing trackage of the steam roads, stops cannot be much increased in populous territory without interference with the movement of traffic. Separation of suburban from through travel is imperative. The addition of new tracks to a long established steam line is, in populous regions, an enormously expensive task, particularly as such tracks must inevitably conform fairly closely in alignment and grade to the older tracks, in order to allow steam locomotive service or heavy electric freight and passenger trains to be operated on the new rails in the flexible manipulation of the whole service.

A new high-speed interurban railway cannot, of necessity, be an enterprise of low cost, but in view of the fact that the route can be selected with particular reference to the requirements of interurban coupled with suburban travel, and without the same physical limitations which restrict even the electrified steam road, it is difficult to escape the conclusion that in many cases the new interurban right of way will cost less per mile than the additional right of way assumed by an expanding electrified steam railroad. In the case of the latter it is probable that if electrification of existing 4-track lines is carried out to the greatest possible extent additional right of way can be deferred for many years. Even if this means a greater cost per mile of track in the case of the competitive interurban road, it does not follow that the converted steam road can duplicate the former's service. The reasons are not obscure.

The interurban line of the future will inevitably be in closer touch with the local street railway systems than the electrified steam lines. This means superior facilities for the collection and distribution of passengers within the terminal cities. The total time of transit from a station on an electrified steam railroad to the great city terminal station will inevitably be much less than the schedule of the interurban, even with the latter on a private right of way. The transportation problem is never solved, however, until the passenger or commodity completes the journey from the point of origin to the point of destination. Collecting and distributing facilities along the line of the interurban road are obviously superior to those of the former steam line, for, while the interurban cannot at the same time furnish the door-to-door service of the original street railway and give fast transportation from terminal to terminal, it can give a service intermediary between that of the street car and that of the electrified steam line, sufficiently flexible in its more frequent stops than the latter, its higher schedule speed than the former, and its superior distributing facilities or multiplex discharge points in convenient sections of the terminal cities to attract a traffic that should insure its future against displacement by any policy likely to be adopted on the electrified steam railroad. The many defects of interurban operation will need to be remedied before the best service can be given. Not the least of these is the prevailing practice of routing interurban cars built for fast running in and ont of large towns over the most crowded tracks of the local street railway companies. Few interurban lines can afford to buy private right of way into large cities, bnt in many instances the routing of the cars by less frequented streets near enough to the main thoroughfares to attract traffic would enable very substantial savings to be made in the elapsed time from one end of the route to the other.

ARRANGING CAR LIGHTS.

Attention was called at a recent meeting of the American Society of Mechanical Engineers to the poor distribution of the artificial light in use in steam railway cars. Until within the last few years, within which electric lighting has been introduced on steam lines, a number of center lights suspended from the upper deck were employed. These were oil lamps in pairs or later two or more gas burners, and the arrangement for the most part gave a sufficiently brilliant light directly under the lamp.

However, between the lamps there was a deep shadow and under all conditions the passenger was confronted with a row of lights shining in his face. With the adoption of electric lighting by the steam railways the practice of carrying a row of lights under the lower deck as on trolley cars was given some attention with the result that more even and better light was obtained. The objection of the tiresome glare of a row of lights shining directly into the eyes remained, however.

In buildings the modern system of illumination provides for an evenly diffused light approaching as nearly as possible the effect of daylight. Such an effect has been secured by many incandescent lights concealed behind a cornice near the ceiling and so located that the light is reflected first to the ceiling and then downward.

The steam railways, on the one hand, have not been able

to introduce a lighting system of this character in cars because of the illuminant employed and electric railways, on the other hand, have not had the complaint of the objectionable nature of the lights because their passengers have for the most part been making such short trips that the tiring effect of the lights upon their eyes has not been felt. But with the increasing length of trips taken by passengers on electric lines an opportunity is offered for the distribution of light which is not open to the steam railways because of the lack of an entirely successful electric lighting system.

With the general use of electric light on trolley cars the electric railways should be able to point the way for improvement in light distribution. It has been suggested that the way lies in the utilization of the molding at the junction of the upper and lower decks for concealing the lamps themselves and effecting a distribution by reflection from the upper and lower decks similar to that obtained by the lights concealed behind a cornice in buildings.

ANNUAL REPORT.

Twin City Rapid Transit Company.

The annual report of the Twin City Rapid Transit Company of Minneapolis for 1907 shows a much smaller increase over 1906 in net earnings than in gross earnings. The result of the financial crisis was felt to some extent in the last quarter of the year. The actual gain in gross passenger earnings was $428,463, and Thomas Lowry, the president, estimates that had it not been for the development of unfavorable conditions, the increase would probably have amounted to $500,000. Miscellaneous earnings amounted to $35,201, as compared with $52,909, but the reason for this decline is not stated. The earnings for three years compare as follows:

	1907.	1906.	1905.
Aver. miles track operated.	360	335	283
Gross earnings	$6,055,743	$5,644,988	$4,759,262
Operating expenses	2,980,436	2,675,380	2,119,145
Net earnings	$3,075,307	$2,969,608	$2,640,117
Taxes, charges, etc.	1,223,171	1,137,428	1,050,797
Net divisible income	$1,852,136	$1,832,180	$1,589,320
Preferred dividends	210,000	210,000	210,000
Balance	$1,642,136	$1,622,180	$1,379,320
Common dividends	1,005,000	952,500	881,387
Surplus	$ 637,136	$ 669,680	$ 497,933
Special appropriations	506,000	482,000	340,000
Surplus	$ 131,136	$ 187,680	$ 157,933

The operating expenses given in the foregoing table equaled 49.2 per cent of gross earnings in 1907, as compared with 47.4 per cent in 1906. Operating expenses, plus taxes and allowance for depreciation, absorbed 63.84 per cent of gross earnings, as compared with 61.83 per cent in the preceding year. The total of all the maintenance expenditures was larger than in 1906, being as follows for the two years: Way and structure, 1907, $192,209; 1906, $195,024; equipment, 1907, $269,748; 1906, $240,230. Car service cost $1,340,962, as compared with $1,167,999. Upon the operation of power plants the company expended $513,867 in 1907, as compared with $467,264 in 1906.

The figures for 1906 as presented in the comparative table published in the 1907 report are somewhat different from those contained in the report issued one year ago. The reason is that decisions against the company in court on claims pending at the close of 1906 amounted to much more than was anticipated, and it was therefore found that the reserve for injuries and damages was inadequate. The sum of $50,000, the estimated amount of the deficiency, was accordingly added to the injuries and damages account of 1906, causing a corresponding reduction in the surplus. The total reserve for injuries and damages amounted at the close of 1907 to $89,995, an amount which the company considers in excess of probable requirements. There was set aside from surplus a special reserve fund of $250,000 for contingencies and $141,855 of this amount was on hand at the close of the year. The specific purpose of this reserve fund is to furnish funds for "extraordinary outlays other than operating expenses, such as discounts on bonds and legal expenses." The insurance fund amounted on December 31, 1907, to $84,743; the sum of $19,671 was added to this fund during the year. With relation to the renewal fund the following is shown: There was appropriated from the surplus of the year $506,000, and this was added, with $17,500 interest on investments, to the renewal fund, the charges to which aggregated $258,929 during the year; the fund stood on December 31, 1907, at $855,920. Nearly all of the money in the renewal and the insurance funds is invested in the 5 per cent bonds of the company. In his statement to the stockholders, Mr. Lowry says:

> The car service has been considerably improved, the car mileage being increased 2,513,089 miles. The rates of wages paid to all employes have also been increased, as has been done on previous occasions when the earnings warranted it, without any demands from them. The company thus keeps in its employment a body of men who are fully satisfied that their interests, at all times, receive fair consideration. No organization has, in consequence, existed among them at any time in the past 14 years. The management feels that the action in both of these matters was well advised, occasioning much favorable comment by the press, and likely to show, in the near future, that it has paved the way to still larger earnings. It recognizes that there is no better asset in the street railway business than a satisfied body of employes and the good-will of the traveling public. Your company is fortunate in having its relations in these respects on a most satisfactory basis.

Mr. Lowry mentions the decision of W. A. Lochren, judge of the United States circuit court, declaring illegal an ordinance passed by the city of Minneapolis requiring the company to sell six tickets for 25 cents. Although the city has appealed to the United States supreme court, Mr. Lowry states that the company is advised by its counsel that they have the utmost confidence that the case was correctly decided and that the judgment will be affirmed.

The figures of traffic compare as follows:

	1907.	1906.	1905.
Revenue passengers	117,414,647	109,194,985	94,666,696
Transfer passengers	35,261,823	31,533,846	26,612,347

The outstanding bonds at the close of the year amounted to $17,900,000, an increase of $1,354,000 during the year. The company sold $800,000 consolidated mortgage 5 per cent bonds, and purchased $574,000 additional bonds for the renewal and reserve funds, making a total of $1,374,000 issued. There were redeemed $20,000 Minneapolis Street Railway 7 per cent bonds. The common stock and preferred stock issues were unchanged at $20,100,000 and $3,000,000, respectively.

Elevated service on the Brooklyn bridge was interrupted from 6:30 to 9 last Saturday night because two elevated cars were derailed and one torn from its rear truck, near the Brooklyn terminal. Service on the trolley lines was maintained with difficulty, because of the unusual press of traffic. Incoming trains at the Brooklyn terminal were switched into the yard or sent around the loops and the passengers received transfers to the surface lines. Although the north track of the elevated road over the structure was not blocked, it was found impracticable to operate shuttle trains because of the new switching system at the Manhattan end of the bridge. A wrecking crew from the Bay Ridge station, Brooklyn, was rushed to the Brooklyn terminal and the cars were jacked back onto the tracks.

The power house of the Wilmington (Del.) City Railway was flooded on account of an overflow in Brandywine creek on February 26 and the plant was shut down and the street railway service interrupted for several hours.

THE HANOVER & YORK SINGLE-PHASE RAILWAY.

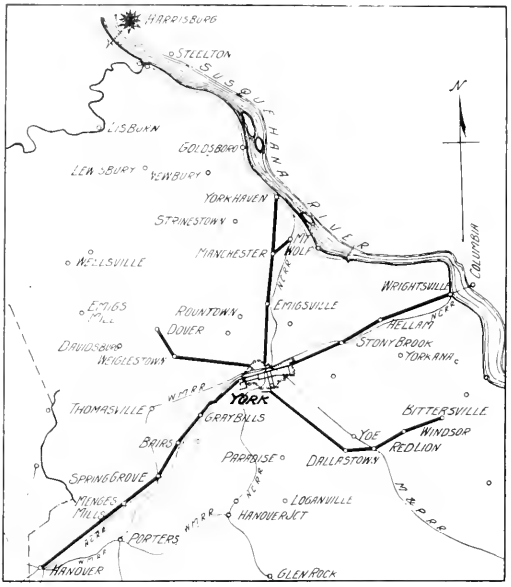
The York Railways Company, York, Pa., has just added to its interurban system a 20-mile single-track line between York and Hanover, Pa. An accompanying map will serve to show the lines of this company, which radiate in five directions from York. The old lines are all operated with 600-volt equipment, while the equipment for the new Hanover division is designed to operate either on 6,600-volt alternating current or 600-volt direct current.

Track and Roadway.

The route of the Hanover & York railway follows closely that of the Pennsylvania Railroad, serving the same territory. The steam road is crossed twice, but the grades are separated in each instance. Leaving the center of the business district of York, the cars will operate for two miles over the city tracks to the southeast limits of York, where the private right of way of the interurban line begins. This private right of way is continuous to within about four blocks of the center of Hanover. Inasmuch as the general surface of the country is comparatively rough, a large amount of earthwork was required to obtain a roadbed with maximum grades of 2 per cent and curves of long radius.

The track, which includes 80-pound T-rails, connected with Weber 4-bolt joints, is ballasted with crushed rock. The rails are electrically connected with 15-inch No. 0000 American Steel & Wire Company soldered bonds, one at each joint. There are no surface crossings with railroads and each of the bridge structures is of a permanent type, built of steel and resting on concrete piers and abutments. Two of the accompanying illustrations will serve to show the types of through truss and deck girder spans employed. The structural steel work was built by the York Bridge Company. The general contractors for the roadway work were Dodge & Day, Philadelphia, and John H. Dobbling of York.

station is stepped up to 23,000 volts and transmitted to York, where the power company has a step-down station in which



Hanover & York Railway—Interurban Lines of York Railways.

the pressure is lowered to 2,300 volts. At this voltage current is delivered to the station of the York Railways Company,

Hanover & York Railway—Overhead Crossing with Highway and Stream.

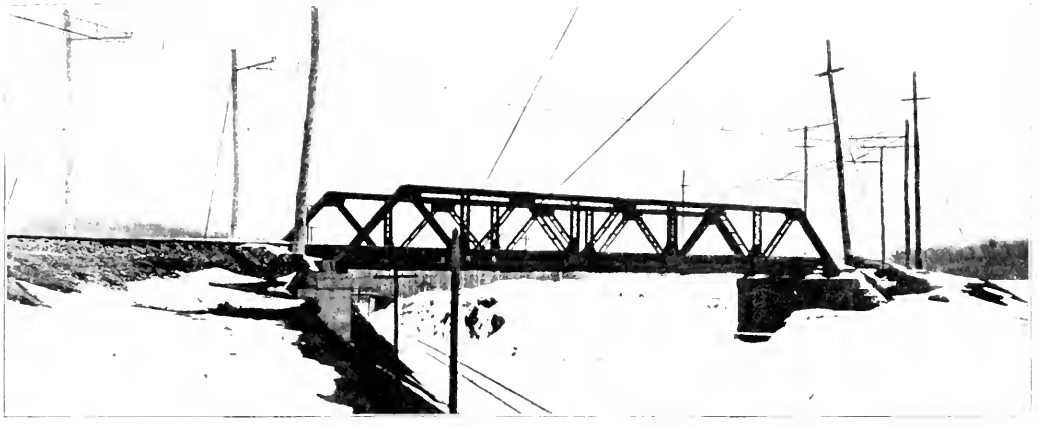
At each important highway crossing the company has erected a shelter shed of the attractive design illustrated herewith.

Power Distribution.

Current for the operation of the line is purchased from the York Haven Water Power Company, which has a hydraulic plant on the Susquehanna river, 12 miles north of York. The power is generated at 2,300 volts, which in the generating where it is fed to two 450-kilowatt Westinghouse motor-generator sets. Each of these units comprises a 2,300-volt three-phase 60-cycle synchronous motor, driving a single-phase 6,600-volt 25-cycle generator. Exciting current is furnished by a 3-machine set, comprising an induction motor driving two 125-volt direct-current Westinghouse generators. The regulation of the motor-generator sets is effected with a Tirrell regulator, which controls the field current of the exciting generators.

From the line switch at the power house in York the 6,600-volt current to feed the interurban trolley wire is carried across the city on an independent pole line supporting one No. 0000 feeder and one track return wire of the same conductivity.

The trolley wire throughout the length of the private right of way carries current at 6,600 volts pressure. The wire is supported by catenary construction and fittings of standard

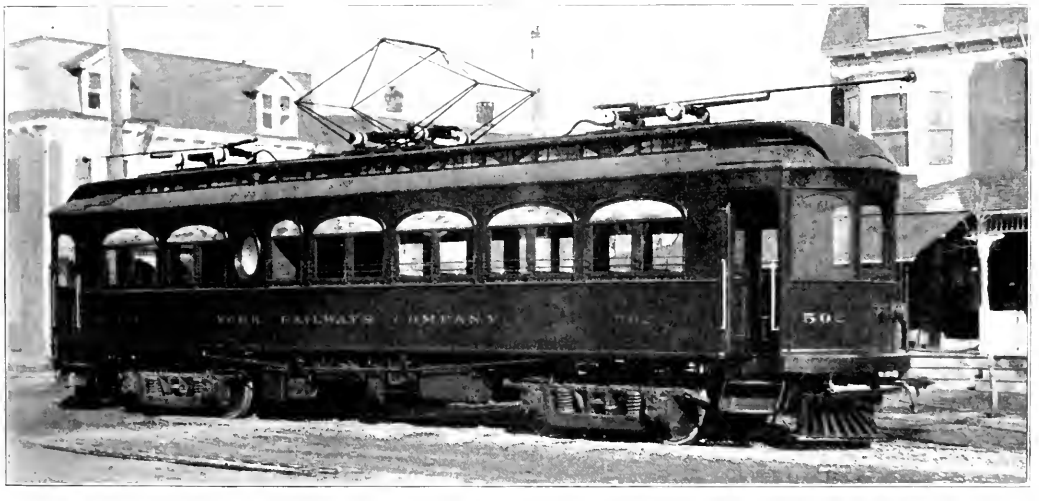


Hanover & York Railway—Overhead Crossing with Steam Railway.

Westinghouse manufacture, with vertical hangers spaced 10 feet apart. The side brackets which support the messenger wire are carried on chestnut poles 55 feet high with 7-inch tops, spaced 100 feet apart. A 4-pin arm supports a telephone circuit and wires for an automatic block signal system, now

The rolling stock equipment, recently built by the Niles Car & Manufacturing Company, Niles, O., comprises four double-end passenger cars with smoking and passenger compartments, toilet rooms and separate heater closets. The general specifications of these cars follow.

Length over buffers	51 ft. 3 in.
Over vestibules	49 ft. 11 in.
Of car body	40 ft. 5 in.
Of vestibules	4 ft. 9 in.
Passenger compartment	28 ft. $5\frac{1}{4}$ in.
Smoking compartment	11 ft. $11\frac{3}{4}$ in.
Height under sills to top of roof	9 ft. 5 in.
From track to top of roof	12 ft. $11\frac{3}{8}$ in.
Between truck centers	27 ft. 6 in.
Wheel base of trucks	6 ft. 6 in.



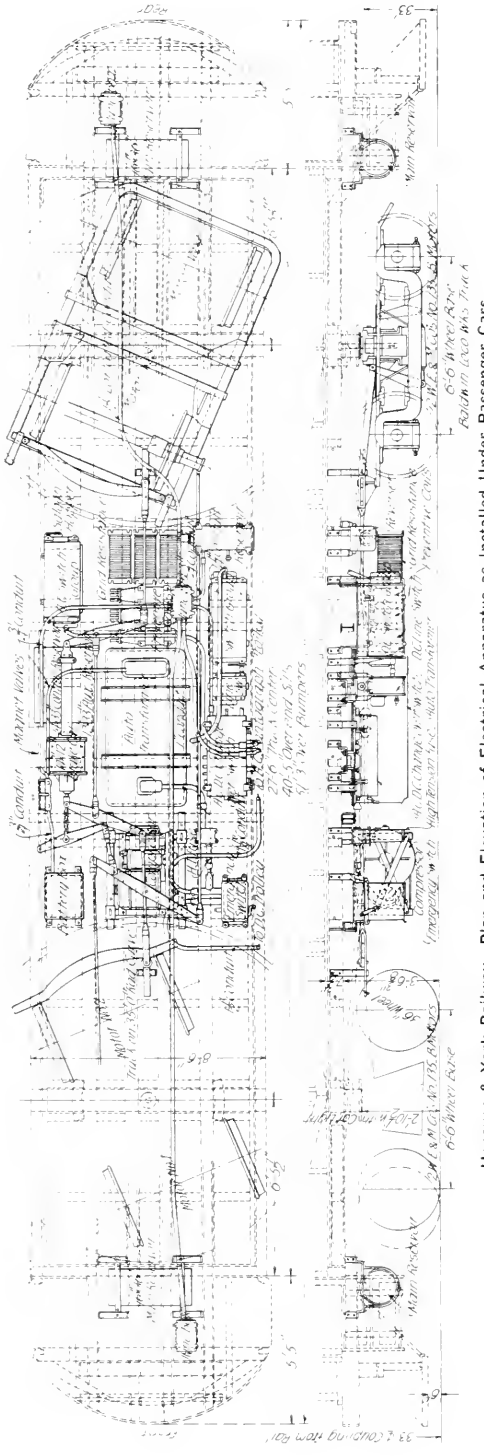
Hanover & York Railway—Passenger Car for Combined Direct and Alternating Current Service.

being installed by the W. S. Jackson Automatic Signal Company of York, Pa.

Where the high-tension trolley wire passes under bridges these structures are protected by a wooden ceiling of substantial construction. The design is such that should a trolley wheel or a pantagraph collector leave the wire it will not be possible for it to ground the trolley wire or messenger on the overhead bridge structure.

Width over sheathing	8 ft. $7\frac{1}{2}$ in.
Over all	8 ft. 10 in.
Of aisle	19 in.
Length of seats	37 $\frac{3}{4}$ in.
Weight of car body, about	30,000 lb.
Total weight, approximately	82,000 lb.
Seating capacity	52 persons

The cars are mounted on Baldwin Class 78-30 trucks, with Standard rolled steel wheels and Symington journal boxes. The braking equipment comprises Peacock hand brakes and Westinghouse schedule A M M automatic air brakes with a

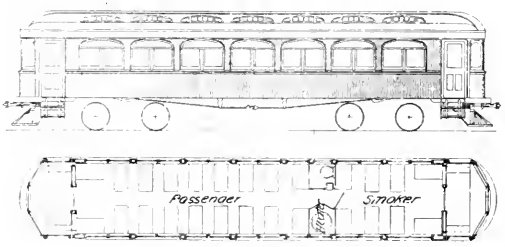


Hanover & York Railway—Plan and Elevation of Electrical Apparatus as Installed Under Passenger Cars.

combination alternating and direct current air compressor. The air brake equipments have 12 by 14 inch cylinders.

The electrical equipment of the cars was supplied by the Westinghouse Electric & Manufacturing Company. Each car is equipped with four 135-B motors of 75 horsepower each, connected for multiple operation with the Westinghouse company's unit switch control system.

An accompanying engraving from a line drawing shows the arrangement of the electrical apparatus under the car, in plan and elevation. It will be noted that the autotrans-



Hanover & York Railway—Sketch of Car Seating Arrangement.

former, which receives the 6,600-volt alternating current, is carried under the center of the car and the auxiliary switches, resistance grids, etc., are grouped systematically around this transformer. The coupler heads for the train line are built in the dash of the car. All the electric wiring in the car is inclosed in loricated conduit.

The new cars are equipped with both wheel and pantagraph current collectors. The operation of the pantagraph is

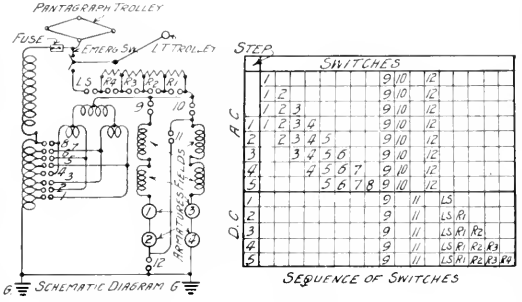
Hanover & York Railway—Passenger Coach Interior.

controlled by two buttons located underneath the master controller. By pressing one button the air pressure releases a catch which holds the pair of springs serving to force the sliding bar against the trolley wire. Pressing the other button permits air to flow in between two pistons connected with the pantagraph springs, forcing them apart and pulling the trolley down. The wheel trolley is insulated for 6,600 volts and can be cut in for alternating-current service by throwing an emergency switch. The car body has a roof covering of 16-ounce copper.

Accompanying sketches show the multiple-unit control

wiring in a condensed form and also exhibit the sequence of the unit switch operation on various controller notches for alternating and direct current service.

The interiors of the car bodies, a view of which is presented, are lighted by thirty-five 16-candlepower lights along the deck rails and three clusters inclosed by holophane bowls. The car interiors are finished in quartered oak and have full Empire ceilings. The window construction is the Niles Car & Manufacturing Company's double Gothic Pullman type. The seats, which are of Hale & Kilburn manufacture, are upholstered in green, leather being used in the smoking compartment and plush in the main compartment. Some of the special features of these cars are as follows: Franklin heaters, Knutson retrievers, Lintern marker lights, dry hopper with cement floor in the toilet room, Sterling-Meaker registers, Providence fenders, Tomlinson automatic couplers and Lintern sand boxes and traps with National cab valves.



Hanover & York Railway—Diagram of Main Car Circuits and Table of Switch Sequence.

Hanover & York Railway—Station Building for Road Crossing.

An interesting method is used to deliver sand from the air sanders to the rails. An iron pipe is clamped to the truck frame in front of each wheel. These pipes are connected with the bottom of the traps by coil springs of steel wire, the coils being 1¼ inches in diameter and having their upper ends fastened to the traps and the lower ends sliding inside of the delivery pipes. Over each coil is placed a length of canvas hose, which serves to keep the sand within the coils of the spring and assures that no matter what radius curve the car may be on the sand will be carried from the trap to the delivery pipe, which is rigidly fastened to the truck frame.

The new line will operate cars on 1-hour headway, making the 20-mile run from the center of York to Hanover in 50 minutes, thus allowing a 10-minute layover at each end.

NEW CONSTRUCTION OF THE STEUBENVILLE & EAST LIVERPOOL RAILWAY.

The Steubenville & East Liverpool Railway & Light Company and the Ohio River Passenger Railway Company, which constitute extensions of the East Liverpool Traction & Light Company to Steubenville on the south and Beaver and Rochester, Pa., on the east, are putting into operation now from time to time parts of the new lines which are nearing final completion. Recently the opening of that part of the line between East Liverpool, Toronto and Steubenville was made the occasion of a celebration, in which the mayors and officials of all of the cities through which the lines pass and many prominent people took part.

The Steubenville & East Liverpool Railway & Light Company of Steubenville O., was incorporated in 1906. It purchased and has since operated the property of the Steubenville Traction & Light Company, which owned and operated the street railway system in the city of Steubenville and an interurban single-track electric railway between the cities of Steubenville and Toronto, O., a distance of 10 miles. This company also owned an electric light plant in Steubenville. The Toronto Electric Light & Power Company was also acquired. The new company has constructed a new double-track high-speed interurban railway from Toronto, which point has been the northerly terminus of the single-track interurban railroad between Toronto and Steubenville to the city of Wellsville, a distance of 7.63 miles, where connection is made with the double-track system of the East Liverpool Traction & Light Company. The new company is also now constructing a second track paralleling the present existing track between the cities of Steubenville and Toronto, and has improved and shortened the old route by taking out curves and reducing grades.

The power house at Steubenville has been entirely rebuilt and greatly enlarged by the installation of two 500-kilowatt turbo-generators, new electric lighting machinery, new switchboards, new and enlarged boilers; also by the installation of a cooling tower. The old power house of the Toronto Electric Light & Power Company at Toronto has been remodeled into a substation.

The entire track has been constructed of 85-pound A. S. C. E. T-rails in 60-foot lengths, laid on white oak ties, upon a first-class roadbed, ballasted with gravel and crushed stone. A small portion of the road is located upon the highway, but the greater part is upon private right of way.

New rolling stock purchased for the through interurban service consists of 18 cars, 42 feet long. They are finished in mahogany throughout and seat 44 passengers. The smoking compartment seats 16 passengers. The cars are painted a rich yellow and bear the legend "Ohio Valley Scenic Route" in aluminum letters bordered with black. The cars are equipped with four 60-horsepower motors, Brill trucks, electric arc headlights, electric heaters and Lintern signals.

Construction is now in progress from East Liverpool to Beaver and Rochester, Pa. At Steubenville a track connection is made with the track of the Wheeling Traction Company, which reaches Wheeling, a distance of 21 miles to the south, and on the east it has contracts for running rights over the tracks of the Beaver Valley Traction Company, which has perfected a connection between Beaver and Pittsburg, a distance of 25 miles, except for a short distance through Sewickley.

On the north track connections will soon be made at East Liverpool with the line of the Youngstown & Ohio River Railroad and the Youngstown & Southern Railway, from

Youngstown to East Liverpool, a distance of 50 miles, which is now completed and operated within six miles of East Liverpool.

The cars will operate on a half-hour schedule, leaving Steubenville and East Liverpool on the hour and half hour.

The officers of the company are: Van Horn Ely, president, Edward McDonnell, secretary and treasurer; J. C. Rothery, general manager.

Westinghouse, Church, Kerr & Co. of New York are in charge of the construction work. The Ohio Valley Finance Company of Buffalo, N. Y., of which Hon. W. Caryl Ely is the president, has financed the construction.

SHELTER STATIONS OF THE DULUTH STREET RAILWAY.

BY HERBERT WARREN, GENERAL MANAGER.

The Duluth Street Railway has recently erected a number of shelter stations, as shown in the accompanying engravings, to meet the requirements at points in the residence districts where a considerable number of persons are in the habit of

Duluth Shelter Stations—Front View.

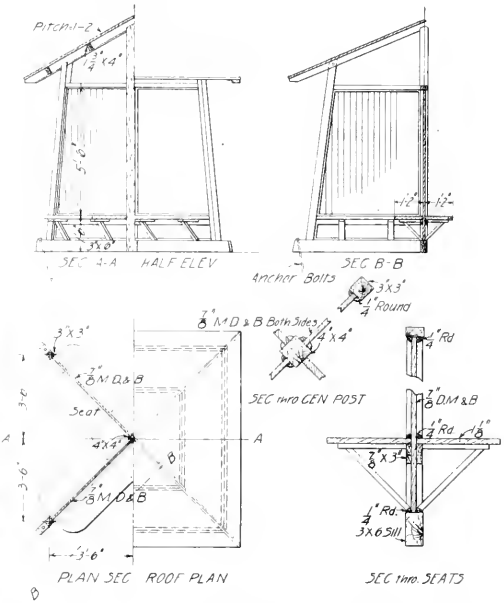
waiting for cars. The type of shelter chosen is simple, yet very practical. There are no side walls, but protection from the weather is afforded by the arrangement of the interior partitions. The shelter is divided into four equal compartments by these partition walls, which radiate from the center to the four corners. The details of the construction are shown in the engraving.

We formerly placed old car bodies in such locations, but they were unsightly from the start, and they were invariably demolished by vandals in a very short time and became a nuisance in the neighborhood. We found this to be the invariable fate of such inclosed shelters even in the best residence districts, and we had to discontinue using them.

Of late years when there has been a demand for us to set up an old car body in such a location we have replied that we would furnish the car body and bear the expense of setting it up, provided we could get someone in the neighborhood to accept a bill of sale for it at a nominal figure and become responsible for it. We made it plain to such persons that they were likely to be put to the expense of moving the car in case it was found to be a public nuisance. Some that were put up in this way fared a little better than those which we formerly took the responsibility of putting up. Vandals seem to have a little more respect for the property of private individuals than they have for the property of corporations. However, they were in most cases treated almost as badly as when we owned them, and we gave up entirely having anything to do whatever with any inclosed shelter at such places unless conditions were such as to warrant an attendant being kept constantly in charge.

In some localities and at transfer points we have put up small inclosed buildings which are rented to be used as confectionery and cigar stands, with the understanding that they are to be kept open at all hours during which cars are passing, but such buildings are not welcomed in the best residence districts, and even if they were there would be nothing to warrant maintaining such stands in those districts.

After we had found from experience that it was absolutely impracticable to maintain any sort of inclosed shelter in the residence districts we decided to put up something that would merely break the force of the wind and keep off heavy



Duluth Shelter Stations—Details Showing Method of Construction.

rain, and the present shelter is the result. It does not make any pretensions of being a waiting room, but in a blizzard it is a great deal better than nothing. It is so constructed that it is not as likely to become a nuisance as if it were inclosed and it will take a small boy with a jackknife some time to whittle it down. The shelter was designed by German & Lignell, architects, of Duluth.

Western Pacific Not to Use Electricity Immediately.

E. T. Jeffery, president of the Western Pacific Railway, denies the recently published reports that the road would use electricity as a motive power. Mr. Jeffery is quoted as follows: "We have discussed the question of electricity for the Western Pacific from time to time for a year and a half or more, but have not yet reached any definite conclusion. The probabilities are that when we open the railroad for operation we shall have steam power, but we shall continue our studies of the uses and merits of electric power with a view to its adoption in the future."

SIGNALS AND AUTOMATIC TRAIN STOPS IN THE HUDSON TUNNELS.

The signal equipment of the tunnels of the Hudson & Manhattan Railroad under the Hudson river between New York and Hoboken is a good example of the latest and best practice in block signaling, interlocking and automatic train stopping. When the order was placed it was specified that every known means for providing safety of train operation should be furnished and that the cost of the system was to be a secondary consideration.

The installation comprises a complete automatic block signal and automatic train stopping system, covering all tracks between Nineteenth street, Manhattan, and Hoboken. Between Hoboken and Greenwich avenue—the river section of the tunnels—signals are placed on an average of 367 feet apart. The minimum distance where speed is low is 115 feet, and the maximum is 1,620 feet. On steam railroads block signal sections average about one-half mile in length; on the express tracks of the New York subway the distance is 800 feet, or nearly seven signals per mile. In the Hudson tunnels the signal distance is only 367 feet, or more than 14 signals per mile.

The signals give three indications: Proceed, indicated by a green light; proceed with caution, a yellow light; and stop, a red light. As the consequences of a train passing a signal in the stop position may be disastrous, a device for automatically stopping such a train is used at each signal. This consists of two movable short arms or trips placed alongside each rail. When the signal is in the stop position these arms are raised to engage with the trigger of a valve in the air brake pipe of the train, releasing the air and setting the brakes. Each car is eqnipped with two of these valves, one on each end and on opposite sides of the car. When the signal moves again to the proceed position, the electric motor moves these train stop arms out of stop position, thus permitting the train to pass without setting the brakes, the arms being returned to stop position by gravity after the train has entered the block. This automatic method of train control is in successful use on the Boston Elevated and on the New York Subway express tracks. On these lines, however, but one antomatic stop is used to protect a train. In the Hudson tunnels two stops are used, thus insuring a greater measure of protection.

The arrangement of the block section is unusual and is designed to provide a maximum of safety, together with the greatest possible train capacity. In steam railway signaling, with few exceptions, the block sections end at the home signals, no clear space being provided at each signal in case a train should accidentally overrun the home signal. In the New York subway a space is provided at each signal eqnal to the distance between signals—this distance being called the overlap—that is, the block sections (a space in which one train is permitted at a time) overlap each other for half their length. This is termed a double or one block section. To provide for maximum safety and maximum train capacity in the tunnels, it was found necessary to use a triple or two block overlap—that is, one block section is the length of three overlaps. Under this arrangement, if a train should stop in the tunnel, it would be protected by three stop (red) signals, four caution (yellow) signals and two automatic train stops. The overlap lengths are made long enough to permit of stopping a train at maximum speed, and include an allowance of one-third as a safety margin.

Another important feature of the system is that both rails of each track are used for the train propulsion current and also for the signal current. This permits of broken rail protection—that is, a broken track rail will interrupt the circuit and so cause the display of a stop signal and the operation of the automatic stop if the stop signal be displayed.

The block system as described fully provides for the safe spacing of the trains. If the indication of the signals be not obeyed the automatic train stops compel obedience by setting the brakes and bringing the train to rest.

The switches are all under the control of the interlocking devices, consisting of seven plants—one at the Hoboken terminal (the largest), two at Caisson No. 1, two at Caisson No. 2, one at Greenwich avenue and one at Nineteenth street. The interlocking is the well-known all-electric system, the switches being operated by electric motors at each switch. The signals are the same type as used in the block system and are all controlled from the machines, the levers of which are so interlocked that it is only possible to make such movements as have been previously arranged for; conflicting movements are in this manner absolutely guarded against.

An interesting and novel feature of this plant is the illuminated track diagram. This is a diagram or chart of each track layout painted on glass and placed in front of each machine for the information of the operator. Each line of track has a row of small electric lamps placed back of the glass; these lamps are controlled from the different track sections; when the tracks are unoccupied the lamps remain lighted, showing a bright green light; as soon as a train enters the limits of the interlocking, the lights controlled by the track on which the train is running are extinguished, so that movement of a train along the track can be followed by observing the corresponding movement of the dark space along the track on the diagram. Without this method of indicating train movements it would be difficult for the operator to follow closely the train movements because of his field of vision being limited by the construction of the tunnels.

The system is one of the most complete that has ever been installed, the exacting requirements of operating frequent train service in the tunnels being such that the best that could be obtained was imperatively necessary.

The number of signals is 182, divided as follows: Home signals, 90; dwarf signals, 10; distant signals, 82. The number of switches is 13 and the number of automatic train stops 85.

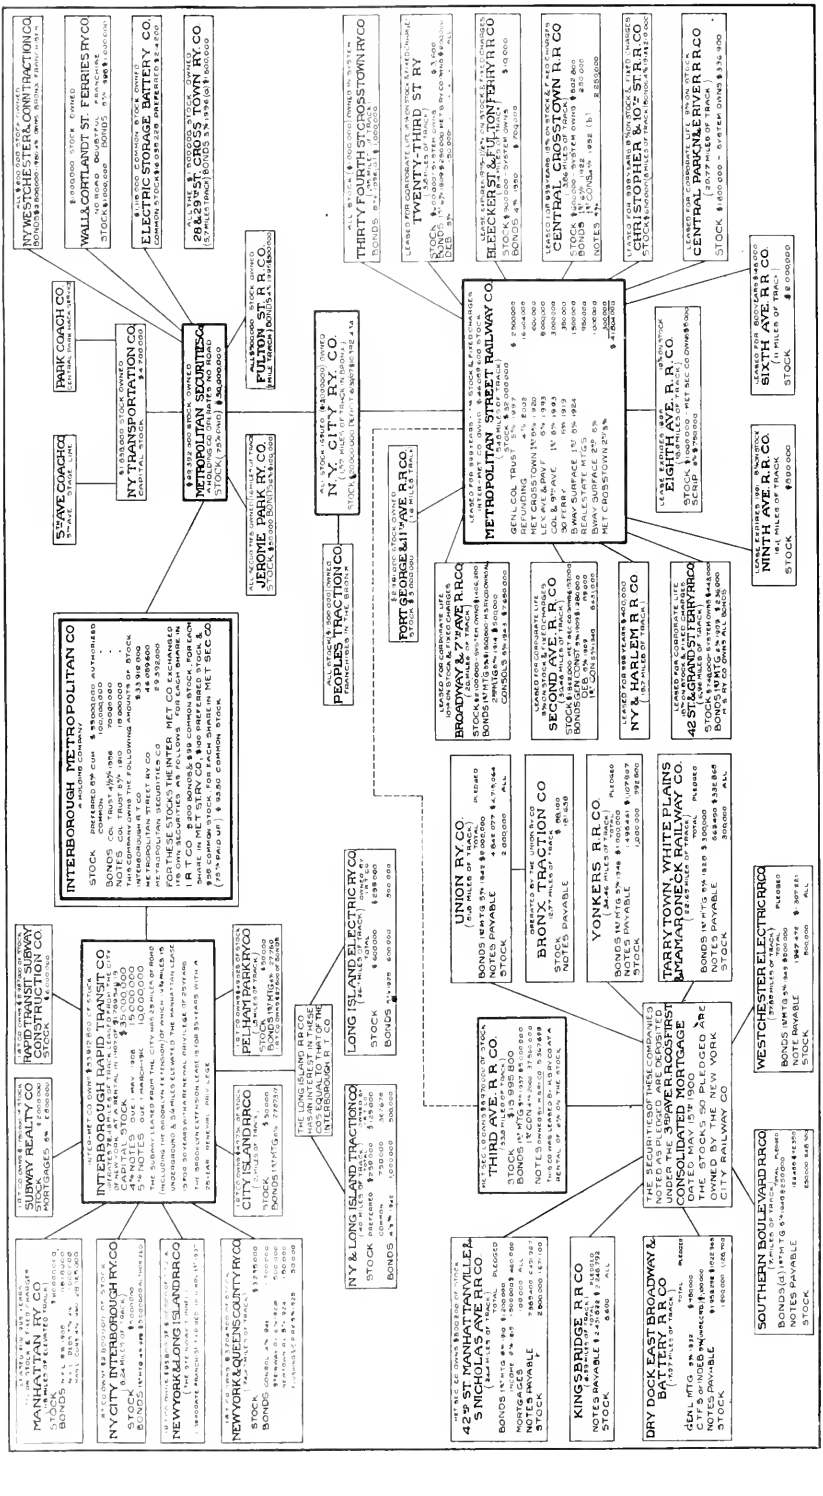
The signal system was furnished by the General Railway Signal Company of Rochester, N. Y., and the automatic stopping system was furnished by the Kinsman Block System Company of New York.

RENEWABLE TROLLEY WHEEL.

Trolley wheel patents of an interesting nature have just been allowed Thomas Langen, Brooklyn, N. Y. The new design is made with a view to affording a wheel of which the wearing parts may be renewed. The side discs of any trolley wheel have a much longer life than either the bottom of the groove or the bushing forming the center bearing. In Mr. Langen's type of wheel both the bushing and the groove in which the wire runs can be renewed at a small cost for labor and there also is afforded a large oil space.

When a wheel is worn in the groove until too thin for use it can be cut through on a lathe at the bottom of the groove and the sides separated. Each side can then be turned out and threaded deep enough to screw onto a short tube threaded at each end. A new grooved wearing surface in the ring form fits over the short tube and is clamped into place by screwing the side discs onto the short tube. The center bushing is forced in, leaving a large oil chamber between the bushing and the short connecting tube. For the smaller 4-inch wheels the sides can be malleable or sheet metal pressed into form and connected as described.

The increasing use of electrical means for the rapid transportation of the United States mails is shown by the statement that at the end of the last fiscal year there were 487 electric and cable routes in operation, with a length of 6,343.89 miles, and an annual travel of 11,302,554.95 miles.



Interborough-Metropolitan System, New York—Chart Compiled by Public Service Commission, First District.

William M. Ivins, special counsel for the New York public service commission, first district, in its investigations into the Interborough-Metropolitan system, has prepared with the aid of special accountants assisting him and submitted to the commission a chart showing the interrelation and interdependence of all the corporations directly or indirectly under the control of the Interborough-Metropolitan Company, including the entire elevated, surface and subway railroad system of Manhattan and the Bronx. The chart shows in sufficient detail the capitalization and funded debt of the different companies. Three large holding corporations formed the foundation upon which the Interborough-Metropolitan Company rests: The Interborough Rapid Transit Company, of the $35,000,000 of capital stock of which the Interborough-Metropolitan Company owns $33,912,800; the Metropolitan Securities Company, with a paid-in capital stock of $30,000,000, of which $29,392,900 is owned by the Interborough-Metropolitan Company; and the Metropolitan Street Railway Company, having $52,000,000 of capital stock, of which the Interborough-Metropolitan Company owns $46,059,600. The Metropolitan Street Railway Company controls 14 subsidiary corporations besides the Third Avenue Railroad. Under the control of the latter are nine corporations. The Third Avenue Railroad is taking legal steps to have the lease held by the Metropolitan Street Railway terminated because of the default of the interest guaranteed and it is probable that a segregation will be effected in the near future. Controlled by the Interborough Rapid Transit Company are 10 subsidiary companies, including the Manhattan Railroad, operating 118 miles of elevated track and having a total stock capitalization of $60,000,000, and also the New York & Long Island Railroad Company, which owns the Steinway tunnel. The Metropolitan Securities Company controls nine companies; two of these are back lines in operation in Fifth avenue and Central park.

INDEX BUREAUS AN AID TO CLAIM AGENTS.

At the meeting of the executive committee of the American Street and Interurban Railway Claim Agents' Association in New York on January 30 a resolution was passed providing that a circular letter be issued to member companies, describing the operation of the local index bureaus. It is desired that many local bureaus be formed, followed by a national index bureau. The circular letter has been issued, signed by H. R. Goshorn, president of the association, Philadelphia, and B. B. Davis, secretary, Columbus, O. An abstract follows:

At present local bureaus are in operation in New York, Chicago, Philadelphia and Boston. Those in New York and Boston were organized over two years ago, and now have in their card indexes many thousands of names of claimants, lawyers and doctors. They have detected many fraudulent claimants, many "repeaters," and have saved the subscribing companies thousands of dollars. The Chicago and Philadelphia bureaus were organized recently, but they are showing good results.

No other method yet devised has been so effective in keeping track of the fakirs who prey upon corporations through claims. With a national bureau it is believed that a check can be placed upon the claimants who travel from city to city having "accidents" in preference to earning their bread by honest labor.

The method of organizing a local index bureau is simple. In the cities mentioned the number of subscribers varies. Chicago has nearly 40 subscribers, Boston has 18, Philadelphia and New York about a dozen each. The cost to the subscribers in each city is $150 per year. Chicago, having so many members, has been able to reduce the cost to $98. Each city should include in its territory all companies within a radius of about 50 miles.

"A"

Name—Smith, John. No.—33456.
Residence—Philadelphia, West Ninth street, No. 53.
Occupation—Carpenter. Age—31.
Date of accident—June 25, 1907.
Physician—Dr. Thomas Jones, 1239 North Broad street.
Attorney—John Brown, Real Estate Trust building.
Remarks—Fracture of left tibia.
This claim reported by Philadelphia Rapid Transit Co.

Index Bureaus an Aid to Claim Agents—Sample Card.
(Original 5⅛ by 3⅛ inches.)

In the smaller cities the radius could be increased. In some instances it will probably be found that a single bureau can be operated so as to include the whole state. If this should be found to be impracticable any member company of our association can receive the benefits of the proposed plan by establishing an index of its own. The plan will be found to be well worth the small trouble and expense involved. Should the national bureau prove a success it is expected that the cost will be so trifling that no company, however small, need hesitate to secure the benefits of membership.

It is particularly requested that all local bureaus adopt the exact size of the sample cards [5⅛ by 3⅛ inches] and the same general form of printing, so that a uniform system can be put into operation at the proper time. These cards are standard size and can be furnished by any card index manufacturing company.

The local index bureau consists of a series of card indexes in which are kept names and addresses of claimants, lawyers and doctors, who figure in suits or claims for damages against the subscribing companies. One operator can easily conduct the bureau. He, or she, receives the cards sent in daily or weekly by subscribing companies and files them. If a repeater is found the matter is promptly reported by the operator to the companies which have sent in the suspected name. Each company is advised of the claim against the other and the companies at once compare notes. Even if the claims are not fraudulent the value of this information will be apparent to everyone who has had experience in claim work. In many other ways the value of the index bureau has been proven to far exceed the cost wherever it has been established.

In the larger cities a separate index is kept of the streets and house numbers, the cards being duplicates of those first mentioned. By means of this index it is possible to keep a reliable record of the number of claims made for each house. The value of this information has been shown in a number of instances, as many as six claims having been traced to a single house within one year.

The records of doctors are made up by the index operator. To each doctor is given a separate card upon which are given the names of claimants treated, the name of the company which reported the claim, and the company's record number, so that at a glance the record, from a claim department standpoint, of each doctor can be ascertained. The record of the lawyers is kept in the same manner, in a separate index.

In the cities where index bureaus now exist the subscribers include steam and trolley roads, electric light, telephone, gas, ice, ferry steamboat, theater, department store, manufacturing and contracting companies. The larger accident insurance and liability companies are also subscribers in each city and their records are frequently of value.

The cards inclosed with the circular are four in number, "A" is used for the alphabetical index, "B" for the street index, "C" for the index of physicians, and "D" for the attorneys' index.

OHIO ELECTRIC RAILWAY BENEFICIAL ASSOCIATION.

The employes of the Ohio Electric Railway Company have recently organized the Ohio Electric Railway Beneficial Association, the objects of which, as stated in the constitution, are to improve the mental, moral, social and intellectual qualifications of its members; to aid and assist its members while they are disabled by reason of sickness or injuries, and at their death to provide for their families. All white male employes of the company are eligible for membership, but new employes will be required to pass a physical examination. The association now has about 1,000 members.

The association is composed of five local bodies known as chapters, located at Hamilton, Dayton, Columbus, Newark and Lima, and the administration of its affairs is delegated to a grand council, composed of the officers of the chapters, who in turn elect grand officers. The number of chapters may be increased or diminished if found desirable.

Each chapter will hold regular meetings once a month and members in good standing of one chapter may attend the meetings of any other. Members may be transferred from one chapter to another upon moving into another district.

Applications for membership are voted upon by the chapter and five blackballs are sufficient to reject an applicant. Members are required to pay $1.00 initiation fee and dues of $3.00 per year. Fines are imposed for failure to pay dues promptly.

In case a member in good standing resigns or is dismissed, provided he has not received any benefits, he may receive a rebate of one-fourth the money he has paid in as dues.

Any member in good standing who is sick or disabled may receive $7.50 per week out of the funds of the association for the first 16 weeks, after which he may receive $3.75 per week for 16 weeks, and $2.00 per week for 16 weeks thereafter. Trustees of each chapter are to visit the sick in their chapter and report at each meeting. Medical examiners appointed by the grand council will examine applicants for sick benefits and report to the chapter whether the applicant is entitled to receive benefits. They shall also visit the sick and report upon their condition at each meeting of the chapter. Benefits will be granted only on the written certificate of the medical examiner and the trustee for the chapter. The medical examiners will also examine all candidates for membership.

Each member is required to pay $1.00 toward a special death fund and upon the death of a member another assessment of $1.00 per capita will be made. A sum equal to at least $1.00 for each member of the association must at all times be held in the grand treasury as a special death fund. Upon the death of a member in good standing the sum of $800, or, if the membership in the association is less than 800, $1.00 for each member, shall be paid to the widow or other designated beneficiary of the deceased.

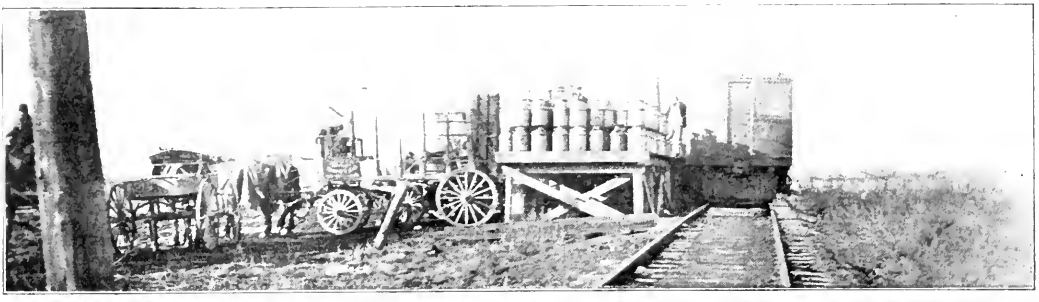
George F. McDonald of Columbus, O., is president of the association and F. L. Boyer of Dayton, O., is grand secretary-treasurer.

MILK TRAFFIC ON THE AURORA ELGIN & CHICAGO RAILROAD.

The Aurora Elgin & Chicago Railroad is the only electric railway which carries milk into Chicago. In developing its milk business this road has had as competitors four steam roads. While statistics are not at hand showing the total number of cans of milk carried since the practice of running trains each day especially for this traffic was first started, figures showing recent changes in the business can be given. During October, 1905, the first month for which complete figures can be shown, the total number of cans carried was 6,514, a daily average of 210 cans. In June, 1907, a total of 16,828 cans was handled or an average per day of 561 cans, making the largest monthly milk traffic in the history of the company. As June, owing to natural causes, is the month of greatest production of milk, the business has declined since that time, owing to the decline in production, but there has also been a reduction in the consumption on account of an increase in the price of milk by producers to dealers, and a consequent advance in prices by retail dealers to consumers in Chicago. The following figures show the number of 8-gallon cans carried per month, with the daily average:

	Total.	Daily av'ge.		Total.	Daily av'ge.
October, 1905...	6,514	210	February, 1907 .	12,447	445
October, 1906...	11,444	369	March, 1906....	9,545	308
October, 1907...	14,268	460	March, 1907....	14,620	471
November, 1905.	7,417	247	April, 1906.....	10,098	336
November, 1906.	10,278	343	April, 1907.....	14,486	483
November, 1907.	13,482	449	May, 1906.....	13,467	434
December, 1905.	8,631	278	May, 1907.....	16,498	532
December, 1906.	11,725	378	June, 1907.....	16,828	561
December, 1907.	14,524	468	July, 1907.....	16,721	537
January, 1906...	9,010	290	August, 1907....	15,577	502
January, 1907...	13,082	422	September, 1906.	12,164	405
February, 1906..	8,168	292	September, 1907.	14,328	478

The milk carried into Chicago is collected by two trains, which leave the car house at Wheaton at 6 o'clock every morning for Batavia and Wayne, which are on different branches.



Milk Traffic on the Aurora Elgin & Chicago Railroad—End View of Chicago Receiving Platform.

Milk Traffic on the Aurora Elgin & Chicago Railroad—Delivering Milk from Train of Motor Car and Box Trailer.

Milk Traffic on the Aurora Elgin & Chicago Railroad—Delivering Milk from Train of Two Motor Cars.

The trains return to Wheaton, collecting cans of milk at platforms located at the principal road crossings. When the cars reach Wheaton they are combined into one train and the trip is made from there to Fifty-second avenue, Chicago. It is at this point that the line of the Aurora Elgin & Chicago road connects with the elevated structure of the Metropolitan West Side Elevated Railway, over which it secures entrance to the business district of Chicago. The companies have not the right, however, to carry milk into the center of the business district. If this right could be secured the business could be multiplied largely. At the Fifty-second avenue station a switch track and a large wooden platform have been provided.

THE AURORA ELGIN & CHICAGO RR. CO.

Good for Transportation of One

8 Gallon Can of Milk

FROM ANY MILK STATION TO

Fifty Second Ave. (Chicago)

Subject to Instructions on the other side.

Form 101 President.

INSTRUCTIONS.

Agents will require of all parties shipping milk that they attach a ticket to each can before placing upon Depot platform or in the car.

Conductors must not receive a can of milk into their trains unless a ticket is attached to the can by means of the eyelet hole.

The ticket must in all cases be torn off and punched by Conductors and sent to the Auditor with other ticket collections.

Agents and Conductors will be particular to see that the capacity of the can is not greater than is represented by the ticket attached.

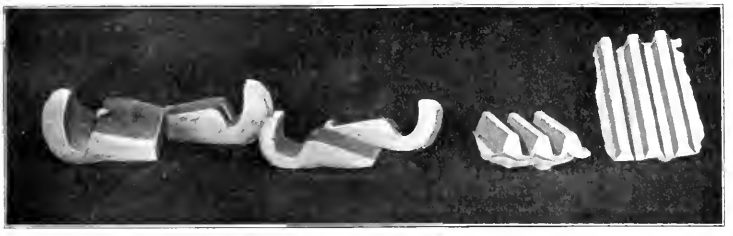
Milk Traffic on the Aurora Elgin & Chicago Railroad—Sample of Ticket.

Trains of two motor cars are usually used in the milk business when the volume is no greater than at the present time. During the times of heavier business two motor cars and a box car are required to handle the traffic. The rate charged by the company for carrying an 8-gallon can of milk from any point on its lines where the cars are operated to the Fifty-second avenue terminal and returning the empty can is 15 cents. Each can is supposed to have a ticket affixed when it is put on the car. This ticket is taken up by the conductor and is turned in with his report. Five men are employed on a 2-car train, the motorman, conductor and three helpers.

The foregoing information has been supplied by Richard Breckinridge, traffic agent of the Aurora Elgin & Chicago road.

FLANGE AND GEAR WEAR RECORDS.

In an electric railway repair shop it frequently becomes desirable for the head of the department to make permanent records of the contour of various wearing parts. When, for instance, gear wheels or various makes of chilled iron or steel car wheels are being used with a view to determining their comparative wearing qualities, some form of accurate record taken during the service of the wheel or gear may become very important at a later date. H. H. Adams, superintendent of shops United Railways & Electric Company, Baltimore, obtains accurate and permanent records of the wear of wheel treads and flanges and gear teeth by making from time to time plaster of paris impressions. A number of such casts are illustrated in the accompanying halftones. It will be noted that these casts were taken part from wheel treads and flanges and part from gear wheels. The great variety of uses to which this simple method of obtaining permanent records of wearing parts can be put should commend it as a useful shop kink.



Baltimore Shops—Plaster of Paris Impressions from Wheels and Gears.

LIFE GUARD TESTED BY CHICAGO CITY RAILWAY.

The Chicago City Railway, in conjunction with the board of supervising engineers of Chicago traction and the city transportation officials, on February 1 made tests of a new type of life guard, 200 of which it is proposed to put into

Chicago City Railway—Front of Car, Showing New Life Guard.

experimental service on 100 cars of the Chicago City Railway. As shown in the accompanying illustration, the life guard comprises a heavy wooden plank set under the car platform at an angle of 45 degrees with the rails. This plank is of oak, 2 inches thick, 12 inches high, and of such a length that it extends in its diagonal position from one edge of the car body to the other.

Contrary to the usual practice in the construction of such life guards this guard does not have a plow shape, but extends in a straight line from one side of the car to the other. The board comprising the life guard is supported on iron brackets bolted to the sills of the platform. The connection between the brackets and board is such that the life guard has vertical play up and down the brackets. Normally the bottom of the guard is 2½ inches above the rails, but bolted to the back of the guard are trailing iron wheels which will serve to raise it off the pavement when a car passes over a vertical curve at a subway or any other point where there is excessive break in the grade.

The lower edge of the guard board carries a cushion which comprises a strip of rubber belting on which is fastened a section of 2-inch rubber hose. The simplicity of this guard and its location entirely under the platform of the car are desirable features. In the tests earlier mentioned a dummy was hit a large number of times and in each instance was rolled to the side of the track, out of the way of the wheels.

The Portland (Ore.) Railway Light & Power Company has instructed its motormen on the city lines in Portland to stop on the near side of street crossings within the city where there are railway intersections. Heretofore motormen have had instructions to stop on both sides of such streets.

ELECTRICAL EQUIPMENT OF THE RICHMOND & CHESAPEAKE BAY RAILWAY.

The Richmond & Chesapeake Bay Railway exhibits several novel features in connection with its single-phase electrical equipment. The construction features of the track and roadway were described in the Electric Railway Review for October 19, 1907, page 666.

The railway company has at present no power station of its own, but the generating apparatus is installed in the

Richmond & Chesapeake Bay Railway—Catenary Construction at Turnout.

Twelfth street power house of the Virginia Passenger & Power Company. This equipment is of special interest, owing to the manner in which provision is made for securing operation under varying conditions at the power house. The generating apparatus consists of two 750-kilowatt 25-cycle three-phase generators running at 128.5 revolutions per minute and designed to supply current at 6,600 and 13,200 volts.

One of these generators is direct connected to a 1,450-horsepower hydraulic turbine at one end of the shaft and to a 750-kilowatt 60-cycle 2300-volt three-phase generator at the other end, both of the units being mounted on a common base. Should there be insufficient water to operate the turbine, the 60-cycle generator will be run as a motor. The other 25-cycle machine is coupled to a water turbine, and also to a 750-kilowatt direct-current generator, the latter machine being used as a motor in the event of low water. From the above it will be seen that when water power is plentiful the 60-cycle generator and the direct-current generator can be used for city lighting. Under the present operating conditions only one phase of the generators is used to supply the line voltage of 6,600 volts.

The electrical equipment of each of the four motor cars which at present comprise the rolling stock consists of four G. E. A.-603-A railway motors, and a full complement of multiple-unit type M Sprague-General Electric control apparatus.

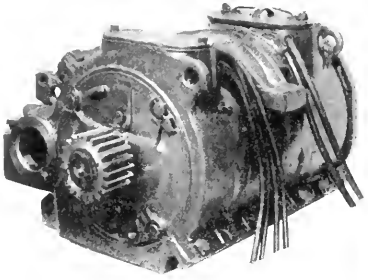
The motors are of the latest pattern, known as the series-repulsion type. These motors have excellent commutating qualities, which have been secured by what is known as the fractional pitch winding of the armatures. This winding performs the same function as do commutating poles in direct-current motors. Each motor has a capacity of 125 horsepower. The capacity and high starting torque of these motors was well illustrated on one of the trial trips. On this occasion one car was coupled to a train of five Norfolk & Western standard railway passenger coaches, carrying 300 passengers, and hauled the load with ease. To further test their capacity, two of the motors were cut out and the remaining two started this same train on a 1 per cent grade.

Each pair of motors with a compensator and contactors forms a practically independent equipment. This feature has the advantage that should one motor or any part of one-half of the equipment become damaged, the car can then be operated as a 2-motor equipment by throwing one blade of a double knife disconnecting switch. The actual control apparatus is practically standard throughout. These are the first General Electric equipments ever put in operation with two compensators. The compensators are oil-cooled and are provided with taps to give 600, 450, 400, 340, 280 and 113 volts. The 600-volt taps are used only on the auxiliary circuits.

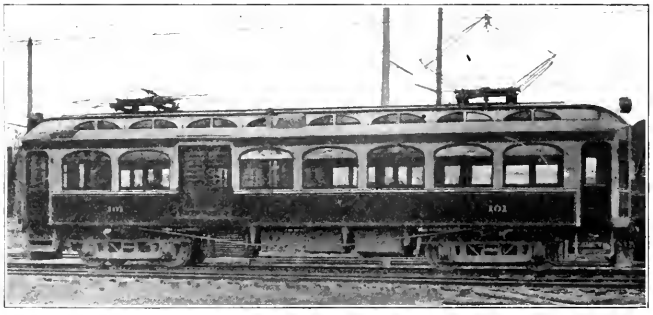
Each car is equipped with two trolleys of the pantagraph type. The trolleys are constructed with steel pans, this material having been found to give greater satisfaction than either copper or aluminum.

The car bodies were built by the St. Louis Car Company and resemble very closely the standard Pullman car as used in steam road service. Each car has separate accommodations for white and colored people. The combination passenger and smoking car has a seating capacity of 64 persons. The seating capacity of the combination passenger and baggage car is slightly less.

The overhead construction is of the catenary suspended type, the trolley itself being of No. 0000 grooved copper wire. The messenger cable is of steel and has seven strands. On the first section of the road between the Richmond depot and the car barns the track is laid on a reinforced concrete viaduct, the trolley being supported by a system of steel spans. Bracket supports are used on the other sections of the road. The Ohio Brass Company supplied a large portion of the catenary material.



Richmond & Chesapeake Bay Railway—Exterior of Single-Phase Motor.



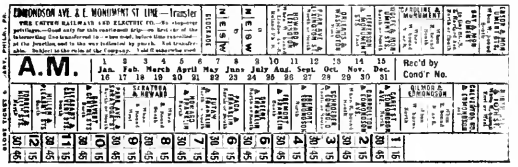
Richmond & Chesapeake Bay Railway—Fully Equipped Motor Car.

The substation at the Ashland terminus is unique, inasmuch as its function is to provide for the lighting of the town from the high-tension single-phase trolley. This is probably the first time that an attempt has been made to supply a lighting system from a high-tension single-phase trolley subjected to severe load fluctuations, and the satisfactory results that have been attained speak well for the design of the regulating apparatus in both the substation and main station. The Tirrill regulators in both the substation and the power house give close voltage regulation.

At the substation the 6,600-volt single-phase current is transformed to 440 volts by two 25-cycle oil-cooled transformers of 150-kilowatt capacity each. From the low-tension side the current passes through a reactance or phase-splitting device to the induction motor end of a motor-generator set, consisting of a 150-horsepower 25-cycle 440-volt single-phase induction motor direct connected to a 100-kilowatt 2,300-volt 60-cycle single-phase generator. A 4-kilowatt 125-volt exciter is mounted on the common shaft at the generator end. The 2,300-volt 60-cycle current leaves the substation through a 2-circuit single-phase feeder panel for general lighting purposes in the town of Ashland. All the electrical machinery, switchboards, indicating and measuring instruments for the new road are of General Electric manufacture.

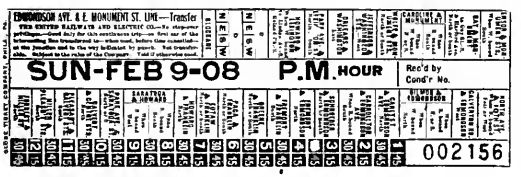
RESULTS WITH NEW TRANSFERS AT BALTIMORE.

Last year on April 1 the United Railways & Electric Company of Baltimore changed its form of transfer. Previous to



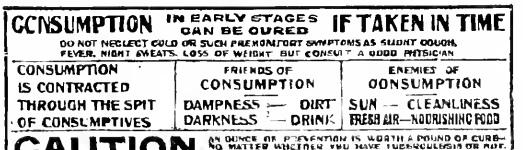
Baltimore Transfers—"Calendar" for Emergency Use.

that time the transfers used did not show the year. The old transfers also required five punches by the conductor, while



Baltimore Transfers—New Form for Regular Use.

the new form of transfer, illustrated herewith, requires but two punches, one showing the junction point and the other



Baltimore Transfers—Advertising on Reverse Side.

the time. It will be noted that the new tranfer also exhibits very plainly the day, year, date and "a. m." and "p. m."

With the change in the form of transfer a large percentage of the damage claims arising from the misuse and misinterpretation of transfers disappeared. Inasmuch as this form of transfer shows so accurately the time it is used, it is necessary to order them very carefully so that the supply may closely approximate the demand. To provide against any emergency when more transfers will be required than have been prepared for any particular half day a so-called "calendar" transfer is kept in stock. It will be noted from the illustration that this transfer must be punched for the indication of the day and month; otherwise it has the same general arrangement as the transfer regularly used, which bears the full statement of the date in large type printed in red ink along the center. Careful examination of this form of transfer will show its especial completeness. All the junction points are shown and the direction in which a passenger may transfer at any one of the junction points is also very clearly indicated.

As an index of the former misuse of transfers before the new kind exhibiting the year was put into practice, it is related that on April 2, the day after the new transfers were distributed, the president of the company received several anonymous letters, some inclosing as many as 1,000 old transfers. It seems that owing to the absence of the year being indicated on the old forms of transfers many persons had been collecting transfers, saving them for a year and dealing in them. The following is a sample letter which came wrapped around a package of about 100 of the old transfers. The letter reads as follows:

Baltimore, April 1, 1907.

Mr. William A. House, United R. W. Co.

Dear Sir:—To my best friends, "good by." United, why did you do it? I will have another system to beat them—the conductors.

Yours, etc.,

"TRANSFER."

Believing that the advertising space on the back of the transfers is as valuable to the company as a means of publicity as it would be to any purchaser, the transportation department each month has the space on the back of the transfers occupied by some of its own advertising; for example, trolley trips, how to get on and off cars, or as shown in an accompanying illustration.

DEPRECIATION NOT TO BE DISCUSSED IN REPLIES TO ACCOUNTING CIRCULAR.

The following notice has been issued by Prof. Henry C. Adams, in charge of statistics and accounts, interstate commerce commission, in relation to Circular No. 20 of the Accounting Series, an abstract of which was published in last week's issue of the Electric Railway Review:

This notice is to supply a statement that should have been contained in accounting series, Circular No. 20, so far as it refers to the tentative classification of operating expenses. That classification makes a provision, among its primary accounts, for depreciation accounts, but it should be understood that, according to an agreement entered into at a general meeting of the representatives of the electric lines and the federal and state railway commissions held in Washington on December 17 and 18, 1907, the question of depreciation need not be discussed in the replies submitted to accounting series, Circular No. 20, for the reason that a special committee of the representatives of electric lines has been appointed for the consideration of that question.

In Circular No. 20 it was stated that replies were desired in duplicate, one copy to be addressed to Professor Adams. B. V. Swenson, secretary of the American Street and Interurban Railway Association, New York, asks the Electric Railway Review to publish a notice requesting companies to send the duplicates of their replies to the New York office of the association instead of to Birmingham, Ala., as stated in the circular. Mr. Swenson snggests, in a letter to the general managers and auditors of street and interurban railways, that, pending the discussion of depreciation by the special committee, there be sent to him, as secretary of the association, any data or information which would be of use to the committee in informing itself on the subject.

RESULTS FROM ELECTRIFICATION OF THE NEW YORK CENTRAL.

The Journal of the American Society of Civil Engineers, February, 1908, Vol. XXXIV, No. 2, pages 68-98, contains a paper by W. J. Wilgus on "The Electrification of the Suburban Zone of the New York Central & Hudson River Railroad in the Vicinity of New York City," which is to be presented before the society on March 18. The author discusses at considerable length the reasons which determined the character of the installation and describes the physical features of the improvement. During the past few years the Electric Railway Review has presented a number of articles bearing on the electrification problems of the New York Central terminals, among which are a description of the electric locomotive and an account of its trial run on November 20, 1904, page 909, and the signal system for the electrical zones of the New York Central on June 15, 1906, page 354. Inasmuch as the construction features within the electrical zone have been so thoroughly described and illustrated by the technical press, the present interest lies in the statement which Mr. Wilgus makes concerning the operating results attained. An abstract of this statement follows:

The principal reasons for undertaking the work were twofold: (1) Demand of the public for the abolition of the nuisances incident to the use of steam locomotives south of the Harlem river; and (2) need for increased capacity of the terminal, by the elimination of a large proportion of the switching movements required with steam locomotive practice; and relief to the main line entrance to the terminal by reducing its use for haulage of dead locomotives and cars to Mott Haven. As secondary considerations there were: (3) The possibility of sufficient economy in operation at least to offset largely the additional fixed charges on the cost of the electrical installation; and (4) opportunities for an ultimate large increase in traffic and corresponding growth of revenue to justify the expenditure for all improvements within the suburban zone.

The first two expectations have been completely realized. The atmospheric conditions in the Park avenue tunnel show marked improvement, even with the presence of the remaining New Haven company's steam service. The effect on the operating efficiency of the terminal has been very gratifying, the increased capacity being estimated at one-third. There has also been a large reduction in the number of shop or "dead" trains to and from Mott Haven.

Reduced Cost of Operation.

The results, as regards the third expectation, have been most surprising. The operation, for a considerable period, of steam and electric equipment side by side has afforded an unexampled opportunity for a true comparison of costs of operation. Until now data on this subject have been based on theory, ignoring many of the indeterminate features of actual operation that have such a weighty effect on costs. For instance, among the variables entering into an analysis of this character are:

(a) Cost and quantity of coal and water at the power station, and on the steam locomotive tender.

(b) Relation of ton mileage of the motive power to total ton mileage, including motive power and cars.

(c) Frequency and volume of traffic.

(d) Mechanical and electrical design of motive power as affecting repairs, and hours available for active service.

(e) Fixed charges, depreciation and maintenance on all items of both kinds of service, that have a bearing on comparative results, including land, structures and equipment.

In other words, to obtain a true comparison observations must be made under like conditions in a known service.

With this object in view, a typical steam switching locomotive, engaged in terminal service, and a steam passenger locomotive, assigned to road service, were each selected for observation in the same class of traffic with electric locomotives. The terminal service embraced switching at the Grand Central yard, and hauling dead cars to and from Mott Haven storage yard, a distance of six miles. The road service comprised the hauling of schedule trains by the electric locomotive between the Grand Central terminal and Wakefield, 12½ miles; and the same trains by steam between Wakefield and North White Plains, 11½ miles.

Observers constantly rode the locomotives for the period of the tests, namely, September 12 to 27, 1907, in terminal service, and October 4 to 18, 1907, in road service. Cyclometers and wattmeters registered actual distances, speeds and current consumption. Record was also kept of the number of cars switched and hauled, and the proportion of time each day engaged in actual service, awaiting duty, and laid up for inspection and repairs.

The coal used contained 14,000 British thermal units per pound, and the cost, per ton of 2,240 pounds, was:

Steam locomotive in terminal service (anthracite).$5.00 per ton
Steam locomotive in road service (bituminous)... 3.50 per ton
Port Morris power station (bituminous)..... 3.05 per ton

Water, per 1,000 gallons, cost as follows:

Terminal service and at power station..... 13⅓ cents
Road service ..... 5 cents

The cost of electric current, when the power station designed load is attained, is taken at 2.6 cents per kilowatt-hour, delivered at the contact shoes of the equipment, and includes all operating and maintenance costs, interest on the electrical investment required to produce and deliver the current, depreciation, taxes, insurance and transmission losses. The details of this cost in cents per kilowatt-hour are:

Items—	Operating costs.	Fixed charges.	Total.
Power station	0.58	0.44	1.02
Transmission losses	0.19	0.15	0.34
Distributing system and substations	0.32	0.92	1.24
Totals	1.09	1.51	2.60

Locomotive wages are practically identical for each class of service.

Table 1 shows the details of locomotive repairs, maintenance and fixed charges for each class of service, from which it will be noted that, although the fixed charges and depreciation of the electric locomotive are higher than those of the steam, owing to the greater first cost, the net result is in favor of the electric locomotive, due to lower costs for repairs and maintenance. These results are based on actual observa-

Subject	Steam: Description	Steam: Amount per annum.		Steam: Per day.	Electric: Description.	Electric: Amount per annum.		Electric: Per day.
Interest	4½% on $15,000		$637.50		4½% on $30,000		$1 275	
Depreciation	5% on $15,000		750 00		5% on $30,000		1 500	
Repairs	General at West Albany	$1 170			General at Harmon	$468		
	Running at Mott Haven	414			Running at High Bridge and Wakefield	166		
	Trips to shops, 300 miles	168			Trips to shops 60 miles	34		
	Use of shops	90	1 842.00		Use of shops	36	704	
	Total for 335 days available for service		$3 229.50	$9.64	Total for 350 days available for service		$3 479	$9.94
Handling and inspection, including fixed charges and maintenance of land and structures	Mott Haven engine-house plant, 365 days		1 231.00	3.37	High Bridge and Wakefield inspection sheds, 365 days		200	0.55
Total			$4 460.50	$13.01			$3 679	$10.49

The saving in favor of the electric locomotive, therefore, is $2.52 per day, equal to 19 per cent.

Results from Electrification of New York Central—Table 1—Comparison of Costs per Day of Available Service.

tions of the steam locomotive covering a period of several years; and of the electric locomotive for two years on the experimental track near Schenectady and one year in the New York zone. The reasons for the lower cost of repairs on the electric machine are the simplicity of construction and the minimum number of mechanical parts. It is also worthy of comment that the electric locomotive costs very much less per day for repairs and maintenance, due to lower expenses for land and structures, and fewer days out of service. For instance, the fixed charges and cost of maintenance and operation of the extensive steam engine plant on costly land, are comparable with the simple inspection shed charges of the electric locomotive.

The Schenectady experiments indicated that the cost of repairs of the electric locomotive of this type is about two-fifths of that of the steam locomotive of a corresponding age and capacity.

The results of these observations are summarized in Table 3. They show that, under the stated conditions, the electric locomotive has the following advantages over its steam rival:

Saving in locomotive repairs and fixed charges.....19 per cent
Saving in dead time for repairs and inspection.....18 per cent
Greater daily ton mileage.....25 per cent
Saving in locomotive ton mileage in hauling service, 6 per cent
Saving in locomotive ton mileage in switching service.....11 per cent
Saving in locomotive ton mileage in road service...16 per cent
Net saving in cost in hauling service.....12 per cent
Net saving in cost in switching service.....21 per cent
Net saving in cost in road service.....27 per cent

Even better results may be expected during winter months, when steam locomotives are subjected to many conditions that cause additional expenses not incident to the electric locomotive.

Owing to the partial use of steam switching locomotives and the presence of the New Haven company's steam road locomotives at the terminal, the full benefits of change of motive power have not yet been secured. However, on the same wage basis for 1907 as for 1906, the month of August, 1907, showed a decrease in cost of terminal locomotive and yard operation of nearly $3,000, although the number of cars in and out increased from 64,984 to 68,519. In other words, the cost of operation decreased 9 per cent while the work done increased 5½ per cent, which is equivalent to a net saving of 13½ per cent.

As to the fourth expectation—increased revenue from a larger volume of business—no definite conclusions can be reached until the extension of electrical service and the completion of the various other improvements afford an opportunity for increase in frequency and speed of train service for the production of revenue from various sources at the terminal; and for the expansion of business that is sure to follow the enlargement of the facilities of the company throughout the suburban zone, not only as regards the local service, but in an even larger degree from long-haul freight and passenger traffic.

Several years will be consumed in the gradual rounding out of the work as a whole; but it is gratifying to have this early indication of the success of the undertaking from both the engineering and financial standpoints.

Apart from these results it is interesting to note the conclusions, suited to this particular problem, that may be drawn from a study of the various observations.

Equipment designed for the electric system over which it is to operate offers economies so superior as to overshadow any other advantages that may be claimed for a kind of equipment that can be operated over several systems. [In the early part of his paper Mr. Wilgus states that the direct-current (New York Central) locomotives require from 15 to 25 per cent less current than do the alternating-current (New Haven) locomotives operating on direct current in the New York Central electric zone.]

In switching service the economy of electric traction lies in savings for supplies and in lower unit fixed charges and repairs, due to less lost time for repairs and care.

In slow-speed hauling the advantage lies in the lower unit fixed charges and repairs of the electric locomotive, due to its ability to do more work while busy, and to less lost time for repairs and care.

High-speed road service shows advantages for electric traction in all three items: supplies, wages and fixed charges and repairs. The small, 18 per cent, increase in current consumption for the greater speed of road service, as compared with hauling service, is in marked contrast to the 165 per cent increase in coal consumption for steam traction.

Opportunities for large economies lie in the thorough training of motormen in the manipulation of their controllers, a very simple problem as compared with the difficulties of teaching both the enginemen and firemen on steam locomotives to perform their duties so as to result in fuel economy.

It is yet too early to express in dollars the comparative effect of steam and electric traction on the cost of maintaining and renewing tracks and structures. Repeated systematic inquiries of all foremen in charge of electric zone track maintenance, and of the motormen operating electrical equipment, have brought out the practically unanimous opinion that the

Kind of locomotive	Miles per day	Cars per day	Busy hours per day	Hours ready for duty daily	Percentage of time dead	Total ton-miles daily	Car ton-miles daily	Percentage of car ton miles to total	Car ton-miles per busy hour	Coal or current per car ton mile	Total cost per car, in cents. Results from Electrification of New York Central—Table 3—Summary of Comparative Tests.

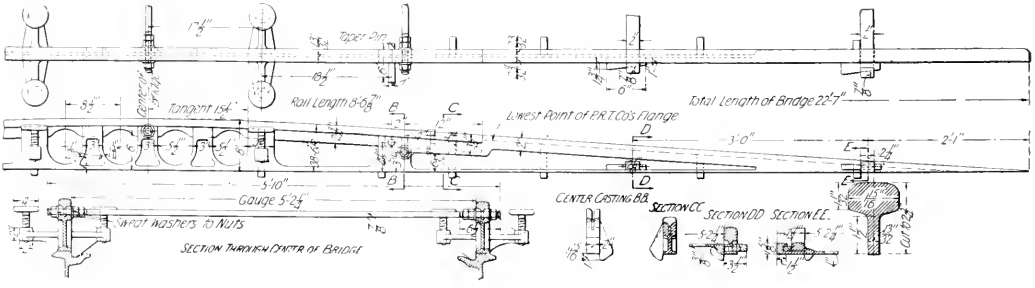
effect of electric locomotives, apart from slightly greater wear on switches, does not differ from steam motive power, on either line or surface of tracks, but that the former has better riding qualities. The superiority of electric traction is manifest, of course, in the cessation of costly corrosive action of locomotive gas on metallic structures, and the freedom from cinders which, with the steam locomotive, cause heavy maintenance costs for cleaning, rock ballast and pointing brick tunnel arches.

SECTIONAL HOSE BRIDGE—PHILADELPHIA RAPID TRANSIT COMPANY.

Through the courtesy of the Philadelphia Rapid Transit Company we present the accompanying illustrations and description of a sectional hose bridge that includes features



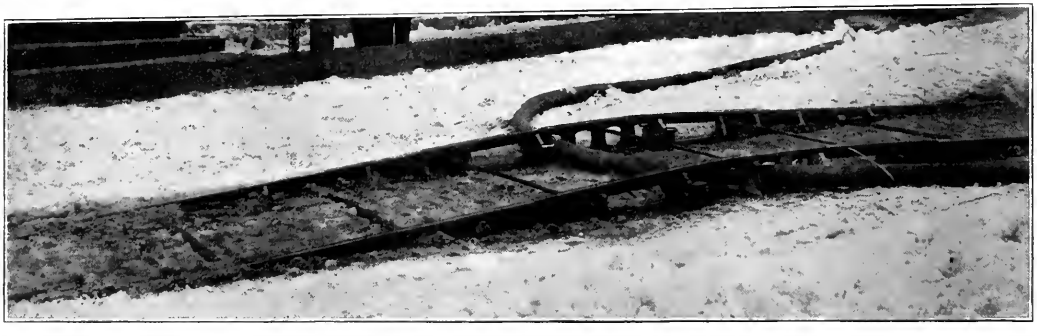
Philadelphia Rapid Transit Hose Bridge—Details of Construction.

of interesting design. Reference to the line engraving will show that the bridge has a total length of 22 feet 7 inches with a rise at the center of eight inches. The resulting incline is so slight that a car can easily pass over the bridge, even though the condition of the rails may be exceptionally bad.

Structurally, the bridge comprises a cast sectional frame with two incline points for each rail, and a center top rail which can be lifted out of its seats in the malleable iron framework so that a line of hose may be inserted or taken away with the least possible hindrance to passing cars. The points of the bridge are cast of manganese steel and the center framework is of malleable iron. Outriders with adjusting screws are provided for each side of the bridge so that the temporary structure may be given a wide bearing on the pavement adjoining the running rail. The two halves of the bridge are joined by seven tie rods. The three center rods are provided with adjusting nuts and the two tie rods at each end are fastened to the opposite sides of the bridge by means of wedges driven to place. The bridge will accommodate four lines of 5-inch hose and space is also available for four more lines of smaller hose. Probably the most valuable feature of this bridge is the facility with which a line of hose can be changed by lifting out the top part of the center section of the bridge rails.

The Philadelphia Rapid Transit Company has seven emergency wagon houses and the wagons at each house are provided with these bridges. Each quarter of a bridge has all its parts painted a color differing distinctly from each of the other three quarters, so that when a bridge is being put together on the street no time is lost in picking out the various mating parts. For carrying these bridges slings are provided which can be hooked under the body of the trolley wagon when it is desired to take a bridge from the emergency house to the scene of a fire. The approximate weights of the various parts are as follows: Manganese steel points, 150 pounds each; malleable iron centers, 150 pounds each; center sections of rail head, 75 pounds each.

An accompanying illustration shows one of these bridges in actual service during a fire in the business district of Philadelphia. The time required for loading one of these bridges on a trolley wagon, getting out of the emergency house, unloading the bridge and setting it up ready for the passage of a car, not including the time required for driving, is 4½ to 5 minutes only.



Philadelphia Rapid Transit Hose Bridge—View When in Service.

The Illinois Traction Company is installing telephone booths at each siding on the Springfield-Decatur line to replace the jack-boxes which have been used heretofore. The booths will be equipped with telephones and electric lights, so arranged that opening the door of the booth automatically cuts the instrument into circuit and lights the lamp, while closing the door reverses the process. These booths have already been installed on the Lincoln-Springfield and Champaign-Decatur lines, and will be installed on the Decatur-Bloomington line.

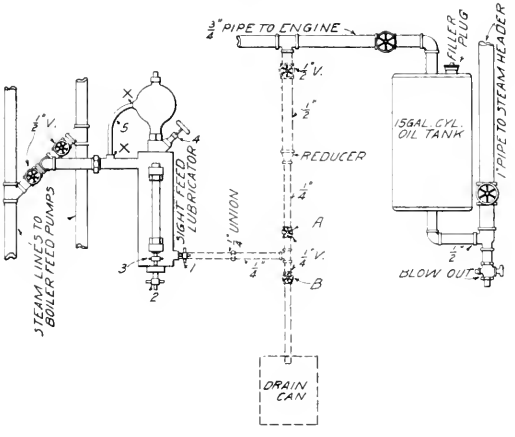
PIPING A LUBRICATOR TO SAVE OIL.

BY J. L. SULLIVAN, MASTER MECHANIC ST. FRANCOIS COUNTY ELECTRIC RAILWAY, FARMINGTON, MO.

There are many boiler feed and other pumping installations which have lubricators of the type shown in the accompanying piping diagram. As a rule when such a lubricator is empty the valves (2) and (3), as shown on the sketch, are closed and (1) is opened, so that the indicator may be blown out. After the lubricator has been blown (1) is closed and plug (4) is taken out so that the oil may be poured in for continued use.

It is customary to fill the lubricators from a can of some kind and frequent use of old coffee pots is made for this purpose.

The usual way of telling when to stop filling with oil is to wait until the lubricator runs over. This causes an unnecessary waste of oil. If the lubricator is filled say four times in 24 hours, the amount of oil that may run over combined with that blown out when preparing to refill will prob-



Lubricator Piping—Arrangement to Facilitate Filling.

ably amount to one-half pint. Thus in a year there would have been thrown away about 20 gallons of oil, and if a plant has three or four lubricators the waste may amount to as much as 60 gallons of oil in a year, which, at 35 to 70 cents per gallon, means a sum worth considering. Remembering that this is an unnecessary waste it will be seen that the loss in a few weeks might pay for connecting the lubricator with the oil supply tank, as indicated by the dotted lines in the sketch, thereby doing away with the old and wasteful method of filling.

The piping illustrated herewith as installed in our power plant comprises two steam lines, one to each pump, which originally had a lubricator on each line. By connecting these steam lines with the ½-inch pipe and using a valve on each side of a connection to the sight feed lubricator, we are enabled to feed oil to either one of the pumps that may be in service, according to the way the valves are set. The small pipe (5) leading from the condensing chamber of the lubricator was taken out and the two openings marked (X) were plugged. In connecting the lubricator with the oil supply the drain plug (1) was taken out and the hole tapped for a ¼-inch pipe with a union as shown. If the lubricator becomes stopped up the ¼-inch valve marked (A) is closed and the valve marked (B) is opened. Then the oil may be drained out of the lubricator into a can or cup later to be poured into the supply tank.

With the piping arrangement as shown the lubricator has now been in service nine months and the method has been found to operate very satisfactorily.

PURCHASING TIES FOR THE INDIANA UNION TRACTION COMPANY.

In securing ties S. R. Dunbar, purchasing agent of the Indiana Union Traction Company, Anderson, Ind., has had favorable results from posting notices on poles at country crossroads and in stations, headed: "Wanted—Railroad Cross-ties in Any Quantity." These notices also give the dimensions of the ties desired, and state that further information can be had from Mr. Dunbar. The notices are kept in evidence by the section foremen. When inquiries are received Mr. Dunbar sends tie specifications, prepared in October, 1907, by W. C. Sparks, superintendent of roadway. In referring to the results of this method Mr. Dunbar says:

I was impelled to endeavor to obtain ties in this manner because of the high prices that we were forced to pay for ties shipped in by steam roads, and the difficulty of obtaining the ties when we wanted them.

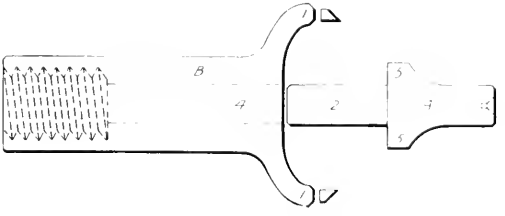
In preparation for the ties which we would need for renewals during 1908 we started putting up notices early last fall, and engaged a man to follow inquiries and also develop what additional business he could by his own efforts. In this way we fully expect to obtain the full quantity which we shall need for tie renewals for the year.

The ties will be of a quality satisfactory to us, and the inspection can be made without the necessity of sending the inspector long distances and having him wait for the trains of steam roads. Besides the saving in the cost of inspection we are able to buy ties from 15 to 20 per cent cheaper than the prices we otherwise would have to pay.

TOOL FOR HOLDING TROLLEY WHEEL.

BY F. A. M.

The accompanying sketch shows a tool for holding trolley wheels when turning up grooves, which is found to be a great convenience and to result in a considerable saving of labor



Tool for Holding Trolley Wheel.

in handling this work. The portion, B, is threaded to fit the spindle of the head stock of the lathe. The shank, 2, of the right-hand portion, A, is turned to fit the trolley wheel with the bushing removed and is a working fit in the central hole in B. When the wheel is placed on A and the portion 2 slipped into hole 4 in part B and the tail stock screwed up, the wheel is held firmly between the shoulders 5 on A and the arms 1 on B so that it cannot move laterally, but revolves with arms 1. If parts 2 and 4 are turned to an easy fit and A is properly centered the wheel will run perfectly true.

When the work is finished it is merely necessary to run back the center to remove the wheel and insert another, no adjustment of bolts, nuts or screws being necessary. If two sizes of trolley wheels are used two of the parts A will be required, one for each size. One portion, B, can be used for both sizes of wheels by providing a bushing for the hole 4. By the use of this device it has been found practicable to re-turn the groove to its original contour at a cost of from 1 to 1½ cents per wheel.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Speed Regulation Distinction Between Steam and Electric Cars.

Indianapolis Union Railway Company v. Waddington, 82 Northeastern Reporter, 1030.—The supreme court of Indiana holds that the fact that electric cars are more readily controlled than steam cars affords just ground for distinguishing, in a city ordinance, between them with respect to speed.

True Rule with Regard to Rights of Vehicles at Crossings.

Daggett v. North Jersey Street Railway Company, 68 Atlantic Reporter, 179.—The court of errors and appeals of New Jersey holds that the true rule is that the driver of a wagon has the right of way, if, proceeding at a rate of speed which, under the circumstances of the time and locality, was reasonable, he reaches the point of crossing in time to safely go upon the tracks in advance of the approaching street car, the latter being sufficiently distant to be checked, and, if need be, stopped, before it reaches him.

Question of Motorman's Negligence Should be Submitted to Jury.

Merki v. Jersey City Hoboken & Paterson Street Railway Company, 68 Atlantic Reporter, 74.—The court of errors and appeals of New Jersey holds that, except in cases where the motorman's negligence is not the immediate or proximate cause of the injury (as, for instance, where the injured person darts, or comes very suddenly, in front of the car, and the accident would have occurred even if it had been running at an entirely safe and proper rate of speed, and the motorman had been on his guard), the question of his negligence should be submitted to the jury.

Requirement as to Stopping of Car Before Ejection of Passenger.

Springfield v. Louisville Railway Company, 105 Southwestern Reporter, 1190.—The court of appeals of Kentucky says that if a passenger is drunk, or uses profane and insulting language, or violates the rules of the company wilfully and flagrantly, he may be ejected from the car, but not while it is in motion. As preliminary to this action, the car must be stopped, and then the passenger can be ejected; no more force being used than is necessary to accomplish this act. Of course the court does not mean to say that there might not be instances which would warrant the ejection of a passenger from a car, even while it is in motion; for example, if it was absolutely necessary to save the life of the conductor or the lives of the passengers, or to prevent their suffering great bodily harm at the hands of a desperate man.

Distinction with Regard to Jerks in Stopping of Cars.

Garner v. Forty-second Street, Manhattanville & St. Nicholas Avenue Railway Company, 107 New York Supplement, 134.—The supreme court of New York, appellate term, distinguishes between possible necessary jerks in stopping cars and one from suddenly increasing the speed after slowing down preparatory to stopping. It says that the plaintiff in this case signaled the conductor to stop. He rang the bell and the car slowed down as it approached the street. As the car slackened its speed the plaintiff arose from her seat and went to the rear platform. At that time the car was moving very slowly, and had come nearly to a standstill. She stood on the platform, holding the guard rail with her hand. While in this position and before she had made any movement to alight the speed of the car was suddenly increased to such a degree as to throw her into the street. It was conceded that the plaintiff was justified in standing on the rear platform in readiness to alight. But the defendant argued that there was no negligence on its part and sought to support the argument by citing cases of persons injured by the violent jerking of a car in starting or stopping. The decisions in those cases, however, proceeded upon the theory that a jerk might necessarily attend the starting and the stopping of a car. That was not the situation here presented, as the car had slowed down preparatory to stopping, and the plaintiff was justified in assuming that the speed would be gradually reduced until the car came to a standstill. The judgment for the plaintiff must be affirmed.

What May be Assumed on Seeing Horse Standing Near Track —Motorman Being Inexperienced Not Negligence.

Columbus Street Railway & Light Company v. Reap, 82 Northeastern Reporter, 977.—The appellate court of Indiana, division No. 2, holds that a motorman had the right to assume, when he saw a horse and wagon standing beside the track and out of danger, that he could safely pass without slackening the speed of his car; that either the horse was properly secured or that it would not frighten at the car. It further says that while it was true that the motorman in charge of the motor on the car in this instance was inexperienced, that fact of itself did not constitute negligence on the part of the street car company. It is necessary that men learn the business. The operation of motor cars is not a natural gift, and the court can conceive of no other way in which the business can be learned than the one that was employed in this case by the company, which had taken the precaution to provide a skilled and experienced motorman to accompany the novice, to teach him the art, and presumably to see that no harm came from his inexperience.

Time and Manner Cars May be Started After Passengers Have Gotten On.

Birmingham Railway Light & Power Company v. Hawkins, 44 Southern Reporter, 983.—The supreme court of Alabama says that in the management of electric street cars it is the duty of the motorman, conductor or person in control to hold the car stationary until those desiring to enter the car have gotten on the car and reached a place of safety. The cases agree that it is negligence to start the car while the passenger is in the act of stepping onto the car, and, on the other hand, they hold that there is no obligation to keep the car standing until the passenger has taken his seat.

As this court has expressed it, the party in charge of the car must see that the passenger is not "alighting (or getting on) or otherwise in a position which would be rendered perilous by the motion of the car." The passenger must be allowed "a reasonable opportunity to get safely upon the car," and "if anything is apparent in the condition of the passenger, so that he would be likely to be thrown or injured by a motion of the car, then proper regard for his safety might require a train to be held in position to avoid it." But it seems that under ordinary conditions, unless some special circumstance requiring greater caution is brought to the attention of the motorman or the conductor, the passenger is considered to have reached a place of safety when he or she has gotten on the car.

It is a matter of common knowledge that many persons do not sit down at all, but ride standing on the platform and in the aisle of the car; there being railings on the platform and loops in the car for passengers to hold to while the car is in motion. Consequently, in this case, in which no special circumstances were shown, the passenger having boarded the car and being in the act of stepping from the platform into the door of the car, it could not, as a matter of law, be said to be negligence for the car to be started in the usual manner and without any unusual jerk. But it would be otherwise if it were started in an unusual manner, with a severe jerk, while the passenger was entering the door.

News of the Week

Detroit Injunction Dissolved.

Henry H. Swan, judge of the United States circuit court at Detroit, announced on March 2 that he would dissolve the injunction restraining the common council from passing the so-called Hally ordinance. This measure is intended to compel the Detroit United Railway, after any of its franchises expire, to sell five tickets for 15 cents. Judge Swan intimated strongly that he doubted the power of the common council to enact such an ordinance legally, but his action is based on the belief that the court did not have authority to restrain legislation.

Receiver for Chicago-New York Air Line.

The Chicago-New York Electric Air Line Railroad Company, which has sold large amounts of stock throughout the country for the construction of an electric railroad from Chicago to New York, which it was advertised would carry passengers between those cities in 10 hours at a fare of $10, was placed in the hands of a temporary receiver on March 4 by order of the court at Laporte, Ind. The temporary receiver, George F. Mull of Indianapolis, filed a bond for $50,000 and immediately took charge of the company and its allied companies, the Co-Operative Construction Company, the Western Securities Company and the Hancock Company. The receivership was ordered on the application of stockholders said to own $250,000 of the company's stock.

The complaint charges President A. C. Miller and other officers of the company with voting themselves excessive salaries, both in stock and in cash, and with participating in rebates and profits in connection with contracts let by the construction company. The complaint states that over $1,000,000 of stock has been sold at prices ranging from $5.00 to $51 a share to more than 15,000 stockholders and that the officers in charge of this money are men of no responsibility or property and have given no bond to insure a faithful accounting for the money. It is further stated that the road could not be built for less than $400,000,000 and that the stock was sold under a fraudulent claim that it could be built for $200,000,000. It is stated that the company's only tangible asset is an incomplete railroad extending from Laporte to Westville, Ind., 12 miles, and that the officers of the company have secured with the company's funds a franchise in the town of Gary which they now claim as their personal property. On March 5, after hearing arguments of the company's attorneys, the court dismissed the receiver, pending a final hearing on the charges.

Directors and Officers of Central Illinois Traction Company Freed from Responsibility for Fatal Accident.

Judge Thompson of the Coles county district court at Charleston, Ill., on February 24 quashed the indictments against the officers, directors and employes of the Central Illinois Traction Company, in which they were charged with manslaughter and criminal negligence in connection with the accident on August 30, 1907, in which 18 persons were killed and 35 injured. The case has attracted widespread attention, not only because of the prominence of the persons involved, but because of the stand taken by the state's attorney for the prosecution that the non-resident directors of the company were personally liable.

As previously reported in the Electric Railway Review, those who were indicted were: Judge Peter S. Grosscup, Arthur W. Underwood, Francis S. Peabody and Marshall W. Sampsell of Chicago, directors; President E. A. Potter of Chicago; Superintendent Fred Moore of Charleston; and B. F. McClara and Charles Botts of Charleston, the motormen of the two cars involved.

In his decision the court held that the 52 indictments were all faulty, not only on account of technical errors, because the grand jury that had returned them had been illegally assembled, but also on broad legal grounds, which completely freed the officers and directors from personal responsibility for the accident.

In discussing the duties and liabilities of the directors, after likening the board of directors to an individual owner, the court said: "Now, then, in this case to say that the owner of this railroad, if you please, would be jointly liable with the motorman running a car would not meet the approval of any fair-minded man, simply upon a statement of that proposition, because we all know as a matter of fact, as well as a matter of law, that their duties are not the same and their responsibilities are not the same.

"To include the directors, then, in this indictment with anyone else in my judgment absolutely vitiates the entire indictment.

"Something has been said about the directors not being liable as individuals; that the corporation would be liable civilly. There can be no question about the civil liability for damages resulting from the death of parties on the car, so far as the corporation is concerned. But I doubt if a single authority can be found in any common law state that holds that directors, in an individual capacity, would even be liable in a case of this kind for damages. I cannot at this time conceive whereby they could be held liable for damages resulting from death. If a director was personally in control and management of this car at the time of the accident, as set forth in the criminal code, the fact that he was a director of the company would make no difference. He would not be held liable as a director in that case; he would be held liable, as anybody else would be, in charge of the car, in the control and management of it at the time of the injury; and the fact that he was a director would not make any difference."

The state's attorney has announced his intention of bringing the case before the next grand jury.

Proceedings in Suit to Forfeit Charter of New York City Railway.

Trial of the suit started by Attorney-General Jackson of New York to forfeit the charter of the New York City Railway on the ground that the corporation had been insolvent for more than one year, was begun on March 2 before Justice Vernon M. Davis of the state supreme court, New York.

The attorney-general set up as proof of the insolvency the balance sheet of the company as of June 30, 1906, which showed a deficit of $6,923,961. The company answered that its solvency or insolvency on June 30, 1906, must depend upon the statement of current assets and liabilities contained in an affidavit of H. W. Brown, the auditor, filed in answer to the allegations of the attorney-general. This statement showed an excess of current assets amounting to $5,000,000 on June 30, 1906. Herbert R. Limburg, special counsel for the attorney-general, attacked the inclusion by the New York City Railway of $5,109,541 in "construction and equipment," and brought out the fact that $4,500,000 of this represented discount upon $15,000,000 notes, issued at 70 to the Metropolitan Securities Company in part payment for the $23,000,000 cash which that company agreed to provide. Mr. Limburg said that he proposed to show that the property of the New York City Railway was turned over to the Metropolitan Securities Company without consideration and that a 30 per cent loss on these notes was charged as an asset and carried down into the statement for 1906, and that the company had been continuously insolvent for five years.

Paul D. Cravath, attorney for the company, admitted that the discount of $4,500,000 was charged as an asset, and said that, while, according to his view, it was a proper capital charge from an accounting standpoint, it should be omitted from the list of assets for the purpose of determining solvency. Mr. Limburg then declared that with an admitted deficit of $6,900,000 and a deduction of $4,500,000 from "construction and equipment," the company would be left, according to its own statement, with a deficit of $11,400,000, which would more than wipe out its capital stock.

When the proceedings were resumed on March 3 Mr. Cravath declared that insolvency must mean in the case of a business corporation only the inability to meet its pressing maturing obligations in the ordinary course of business. Any other interpretation, he added, would put many prosperous corporations in a state of technical insolvency, and be entirely inconsistent with the common sense of the situation.

Mr. Limburg said he proposed to show that the reports of the company carried constantly increasing totals representing material and supplies on hand, whereas it did not have the values shown.

It was admitted by Oren Root, general manager, that an item of renewal of special work amounting to $95,381, representing directly an expenditure for the renewal of tracks that had worn out on curves, was put into the company's statement as an asset, as well as an item of $58,833 for "renewal of horses" and several other large amounts. Mr. Root said that these were proper charges, although they could not be included in a list of assets made up for the purpose of testing solvency.

Progress of the Cleveland Negotiations.

It is now expected that the plans for a lease of the Cleveland Electric Railway to a holding company will take place in a few days. The mayor and F. H. Goff, who are conducting the negotiations, have gone so far as to submit tentative figures for the valuation of the Cleveland Electric property, and although they differ widely, the hope is expressed that the differences may be easily reconciled. On February 27 Mr. Goff and Mayor Johnson agreed to take 64 per cent of the gross earnings as the figure to be used in estimating the

operating expenses of the Cleveland Electric Railway. Henry J. Davies, secretary of the Cleveland Electric Railway, showed that the total receipts per passenger in 1906 were 4.82 cents, which would make the cost of operation 3.0842 cents per passenger. President Andrews of the Cleveland Electric Railway said that the cost of operation cannot be materially reduced under the holding company if the same number of car-miles are run.

Harry Bunning of the Forest City Railway and T. P. Kilfoyle of the Cleveland Electric Railway submitted a report in which the average life of the city franchises was computed as 3.1929 years from January 1, 1908, or to March 11, 1911. Mr. Goff claims an additional time of 0.2649 year, or to June 16, 1911, in consideration of the Glenville grant. They were instructed to make another report on some of the grants.

At the meeting on Saturday, February 29, Mayor Johnson presented a calculation which placed the value of the 234,000 shares of the Cleveland Electric stock at $41.73 a share. This valuation included a physical value of $15,034,614 and a franchise value of $4,014,930. From this amount the indebtedness of the company, $9,141,000, is to be deducted. Mr. Goff presented an estimate of $22,980,000 for the entire valuation, or $59.14 for each share after deducting indebtedness. Mr. Goff's figures were made up as follows: Physical property, including overhead charges, $17,420,000; the value of the city grants, using 5 per cent as an interest rate and 64 per cent for operating expenses, $5,550,000. After deducting indebtedness the total was $13,839,000. To this he asked that $6.00 per share be added for the outlying franchises, $5.00 per share in consideration of a perpetual lease and about $10 per share for good will.

The principal points of difference in the figures are in regard to about $2,000,000 in the physical value for overhead charges, and in regard to the value of the inside grants. The mayor still insists that the outlying franchises have no value. He proposed that the company deduct the physical value of the lines and accept a bonus of $250,000 to keep them after the settlement, suggesting that they might be sold to interurban companies. He declared that whatever he might add to his estimate would be for good will.

The negotiations were resumed on Tuesday of this week. Mr. Davies submitted a report on some of the outlying lines and also an estimate of $22,386,991 for the entire property. To this he said should be added the value of certain outside grants. Another meeting was called for Friday morning. The Cleveland Electric Railway and the Forest City Railway have both called stockholders' meetings to consider the final settlement as soon as the negotiations are completed.

Legislation Affecting Electric Railways.

Maryland.—An amendment to apply to electric railways the provisions of a law requiring separate railroad cars for white and colored passengers has been defeated in the senate.

Massachusetts.—The senate committee on street railways has voted to report a bill granting permission to street railways to transport milk over their respective lines without legislative restriction. Under the terms of the bill electric roads may compete with steam roads, and its passage means much to interurban lines throughout the state. The only line doing a milk business in the state at the present time is the Amherst & Sunderland Railway, controlled by the Holyoke Street Railway, which operates about 17 miles in the Connecticut valley.—John H. Thompson has introduced a bill into the legislature providing that freight and express privileges may be granted to street railway companies in cities of 75,000 or more population upon the approval of two-thirds of the board of aldermen and the mayor.

New York.—Senator Travis has introduced a bill amending the rapid transit law so that private companies may be granted franchises for the construction of subways in New York, for an indeterminate term, at the discretion of the public service commission, the minimum being 25 years and the maximum 50 years, the city retaining the right to purchase the property at any time after 25 years.—Senator McCarren has introduced an amendment to the rapid transit law which removes the provision for separate contracts for construction and operation and requires that a contractor for a new subway must deposit with the city comptroller a bond for 10 per cent of the cost, or, in case the cost is less than $10,000,000, for $1,000,000.

Ontario, Can.—A bill has been introduced into the Ontario legislature to increase the assessments of various electric railways in the province. The matter is being taken up by the Canadian Street Railway Association, and strenuous opposition is to be made against the proposals.

Ohio.—Senator Gayman has introduced a bill requiring the state railroad commission to make a valuation of the property of the steam and electric railways of the state. The commission is authorized by the bill to employ engineers and experts and the companies are directed to afford the commission every facility for making the investigation.—Senator Schmidt has introduced a bill providing that municipal ordinances granting franchises to public service corporations shall be ratified by a majority of the voters before becoming effective.

Sarnia Tunnel of the Grand Trunk.—A trial trip through the Sarnia, Ont., tunnel of the Grand Trunk with electric power was made on February 20, two electric locomotives drawing a 700-ton train.

American Institute of Electrical Engineers, Toledo Section.—At the regular monthly meeting, held in the Builders' Exchange, Toledo, Friday evening, March 6, a paper on "Steam Turbines" was presented by C. F. Sloetemyer.

Street Cars Not Required to Display Red Lights.—Judge Rogers of the common pleas court at Youngstown, O., has held that the city ordinance requiring street cars crossing railroads at grade to display red lights on each side is invalid.

Forged Order for Transfers.—John J. Banermeister of New York City was arrested on February 22 on a charge of forging the name of E. A. Maher, president of the Union Railway, to an order for 50,000 transfers. The order was presented to a printer, who became suspicious, and, after communicating with Mr. Maher, caused the man's arrest.

New York State Street Railway Association.—Secretary J. H. Pardee, 611 West One Hundred and Thirty-seventh street, New York, announces that at a recent meeting of the executive committee of the Street Railway Association of the State of New York it was decided to hold the next annual convention on Tuesday and Wednesday, June 23 and 24, at the Clifton hotel, Niagara Falls, Ont.

Conferences on Uniform Rules in Indiana.—Meetings of the committees appointed at the conference on February 18 at Indianapolis, between the Indiana railroad commission and operating officials of electric railways in Indiana, have taken place, and rapid progress has been made on the work assigned, which is the formation of uniform rules for trainmen and "maintenance of way."

The Steam Path of the Steam Turbine.—The March meeting of the American Society of Mechanical Engineers will be held on Tuesday evening, March 10, at 8:15 o'clock, in the Engineering Societies building, New York City. The meeting will be addressed by Dr. Charles P. Steinmetz, member A. S. M. E., past president A. I. E. E. and professor of electrical engineering at Union University, the subject being "The Steam Path of the Steam Turbine."

New York New Haven & Hartford Reduces Salaries.—The New York New Haven & Hartford Railroad has announced a reduction in salaries, effective on April 1. Salaries above $2,000 per year will be reduced 10 per cent and salaries between $1,200 and $2,000 per year will be reduced 5 per cent, except that no salary in the first class will be reduced below $2,000 and no salary in the second class will be reduced below $1,200. The reduction includes the president, vice-presidents and the managers of the electric lines.

Recent Accidents.—A car on the Detroit Monroe & Toledo line of the Detroit United Railway rolled off a 15-foot embankment near La Salle, Mich., on February 29, injuring two persons seriously and a large number of others slightly. The wheels on the rear truck were derailed at a switch at the end of a trestle and after running a slight distance with the rear wheels on the ties the front wheels also left the track and the car toppled over the embankment, turning upside down. The defective operation of the automatic switch is stated to have been the cause.

Electrolysis Suit in Massachusetts.—The Spencer Gas Company, Spencer, Mass., recently brought suit against the Worcester Consolidated Street Railway, Worcester, Mass., and the Warren Brookfield & Spencer Street Railway, Brookfield, Mass., for an injunction to restrain the companies from operating their roads in such a manner as to damage the gas company's pipes by electrolysis. Justice Hammond of the Massachusetts supreme court has sustained a demurrer filed by the companies on the ground that if the gas company desires to state a case of injury to which each company has contributed the petition must be amended.

Ticket Thieves Arrested.—The Evansville & Southern Indiana Traction Company on February 28 caused the arrest of William Berger, a conductor, and Edward Schelhasse, a former office employe, on the charge of having stolen nearly 200,000 tickets, valued at $10,000. Recently the company noticed that the conductors were turning in more tickets than had been

given out to them and had the tickets stamped with red figures. About 50,000 tickets, with a rubber stamp used for stamping the red figures, were found in Schelhasse's room. He thereupon confessed to the police that he had stolen the tickets while he worked in the office and that he and the conductor had disposed of them.

Indiana Strike Ended.—The strike of the motormen and conductors employed on the city lines of the Indiana Union Traction Company, which was declared on January 1, was declared at an end on March 2 by vote of the Muncie, Anderson and Marion locals of the Amalgamated Association of Street and Electric Railway Employes. As previously reported in the Electric Railway Review, the strike was called on January 1 because the company signed a wage contract with the Brotherhood of Interurban Trainmen. The first days of the strike were attended with great disorder, but the company has been running its cars without difficulty for several weeks, although traffic has been reduced by a boycott declared by the union sympathizers.

Orders of Railroad Commission of Michigan.—The railroad commission of Michigan has issued orders requiring all railways, steam and electric, to file with it one copy of each of its current working timecards, train order blanks and releases and all rules governing movement of trains not published. Another order of the commission provides that when an automatic alarm bell on a highway or street crossing shall be out of order the company operating the railway shall immediately station a flagman at the crossing. The commission has also issued an order providing that former employes of railway companies who have been retired from practical work by reason of old age, infirmity or permanent disability, may lawfully be supplied with free transportation.

Attempt to Lay Track Defeated.—An attempt of the Kentucky & Indiana Bridge & Railway Company to lay an additional track at the New Albany end of the bridge between Louisville and New Albany early last Sunday morning was prevented by the police department of New Albany, assisted by the fire department, who threatened to turn the hose on the workmen. The company desired to lay a third rail to complete a connection between the tracks of the Louisville Railway and the Louisville & Northern Railway & Lighting Company, conforming to the wide gauge of the Louisville lines, and has had a petiton for a permit before the city council for two months, but the council has not acted upon it. The Louisville & Northern has posted in its cars a notice apologizing to the public for the necessity of transferring before crossing the bridge from Louisville.

Minnesota Electric Roads Not to be Assessed on Gross Earnings.—It has been decided that the electric railways of Minnesota shall pay taxes this year on the basis of the assessment of their property in the communities through which the lines run and not on the basis of gross earnings. This understanding was reached at a conference on February 27, between the attorney-general, members of the state railroad and warehouse commission and representatives of the roads. Several months ago the supreme court held that suburban electric railways are common carriers and as such, under the statues, they would be required to pay taxes on the basis of gross earnings. As the roads have not kept their records in such a way as to determine the proper division of earnings according to localities, they were consequently not able to make the report required by the commission. Moreover, much of the property had already been assessed by the localities. Consequently it was decided that the assessment for the present year should be made on the old basis.

Electric Railway Bonds as Basis for Emergency Currency.—Samuel T. Murdock of Lafayette, Ind., who is prominently identified with many of the electric railways of Indiana, has written to the United States senators from Indiana opposing the passage of the Aldrich emergency currency bill without a provision including the bonds of electric railway and lighting companies, as well as railroad bonds, as the basis for an emergency currency. Mr. Murdock says: "This seems unfair, particularly to this section of the country, where traction lines have reached their highest state of proficiency and perfection. While it is true that bonds of both electric light and traction companies, as well as all other securities, should be properly safeguarded, these securities have an intrinsic and inherent value, even greater than many of the railroad securities acceptable under this measure. In the localities in which the roads are built and in the community to which service is given by them their bonds are taken by the banks at a proper and safe valuation and are among the assets of many of these institutions. I sincerely trust that the bill will be modified so as to permit good bonds of the traction and light companies to be used as a basis for currency circulation."

Traffic and Transportation

Increases in Fares in Massachusetts.

On March 1 the Concord Maynard & Hudson Street Railway, Maynard, Mass., increased the unit of fare from five to six cents, making the fare from Hudson to Concord 24 cents instead of 20. Henry Tower, the treasurer, stated that the season had been an especially hard one for the roads and that his road had been affected more seriously than any other. He gave as one reason the closing of the Assabet mills at Maynard. He said that the road earned $7,000 net last year, but did not pay any dividends, as the money was needed for further extensions. It is intended to extend a switch at Gleasondale, which will facilitate travel between Hudson and Marlboro.

Increases in the unit of fare from five to six cents were adopted on March 1 by the Middlesex & Boston, the Natick & Cochituate and the Westboro & Hopkinton street railways, to be operative west of Newton Lower Falls. George A. Sweetser, chairman of the Wellesley, Mass., selectmen, has issued a statement of protest against the increases, in which he says with reference to the Natick & Cochituate road: "The company has paid from 1891 to 1907, inclusive—17 years—141 per cent in dividends, averaging 8 per cent a year. In one year it paid 53 per cent, and in only one recent year has it failed to pay dividends. In only two other years have the dividends been less than 6 per cent since 1897. The street railway has a large floating debt which is not funded. If this could be funded a material saving in interest charges could be made. Just recently the selectmen granted the company an extension of location, which it desired for the purpose of giving better service. Almost immediately after this grant was made the company cut down the number of trips per hour from four to three, and was unable to run cars always on time then. We are going to file with the railway commission a petition for the retention of the 5-cent fares." The companies have issued a statement concerning the change, in which they say: "It is hoped by the management that the necessity for this advance in fares will not be permanent, and that the public will give the management hearty co-operation in this change, necessitated by canses beyond control."

The unit of fares on the Dedham Franklin Medfield & Medway Street Railway was raised from seven to eight cents on March 1. Since January 15 the fare unit had been seven cents, and previous to that time it was five cents. Tickets are now sold in books of 25 for $1.75. The various fare limits, which were not operative under the 7-cent fare, have been restored.

Orders Affecting Service and Fares in New York.

The New York public service commission, first district, has ordered the Brooklyn Union Elevated Railroad to increase the number of trains on the Brighton Beach line about 20 per cent.

The public service commission, first district, has ordered the Interborough Rapid Transit Company to construct additional stairways at the stations at One Hundred and Thirty-seventh and One Hundred and Forty-fifth streets. The cost of the improvements, about $28,000, will be borne by the city. At the hearing on the alleged insufficiency of service on the Ninth Avenue elevated road, New York, Frank Hedley, general manager of the Interborough Rapid Transit Company, submitted reports of inspectors, showing that there were standing passengers in the cars during only a short period in the afternoon rush hours. Mr. Hedley referred to the greatly reduced traffic on the line since the financial crisis. Commissioner Eustis decided that under the circumstances the service is now adequate and recommended that the hearing be dismissed.

The New York public service commission, second district, has directed the New York & Long Island Traction Company, Hempstead, N. Y., to collect no more than 10 cents for a passage in either direction over its entire line, and not more than 5 cents for a single ride not exceeding five miles long in either direction. The company had been charging a 10-cent fare between Hempstead and Freeport, where the distance is less than five miles.

The public service commission, first district, has extended until March 14 the time for answer by the Brooklyn Rapid Transit Company and the Coney Island & Brooklyn Railroad to the complaint against the 10-cent fare to Coney Island.

In response to a request from the public service commission, first district, for information following a complaint from the board of aldermen, F. W. Whitridge, receiver for the Dry

Dock East Broadway & Battery Railroad, New York, wrote as follows: "I trust that the aldermen will consider that the 'unclean, unhealthy and menacing' conditions of which they complain are largely caused by the personal habits, sanitary condition and manners of the people who are carried in the cars, and I should be happy to co-operate with them in any device which they may suggest, including free baths on our routes, for remedying these conditions. I am even prepared to admit that the operation of the cars may be 'a travesty on the transportation accommodations of the great city of New York,' although it is possible that the slowness complained of is because of our inability to purchase faster horses and because also of the fact that the streets are not kept free for the sole use of these cars."

Fare Cases at Atlanta, Ga.

The Georgia railroad commission has been petitioned to compel the Atlanta Northern Railway, which is controlled by the Georgia Railway & Electric Company, Atlanta, to reduce the fare between Atlanta and Marietta from 35 to 20 cents.

P. S. Arkwright, president of the Georgia Railway & Electric Company, has made public a reply to the petition, in which he refers to the attacks on the company and says:

"The taxes of the company were increased 130 per cent, the largest increase on any corporation in Georgia. Fares have been reduced to five cents on all the city and suburban lines of the Georgia Railway & Electric Company, universal transfers being granted at the same time. With it all every concession made by the company has been made voluntarily, for the general public good, and at financial sacrifice to the company. Every effort has been made to meet the just demands of the public. Additional cars have been put on all lines; the service has been steadily increased and improved; the lines have been extended, rebuilt and new territory opened up. We had hoped to conduct many improvements which have been made impossible. The company is exerting every effort to deal not only justly, but liberally, with the public. It has always been the policy of the company to do anything the public demands or else give a good and satisfactory reason for refusing. Complaints like the present do not encourage the construction of interurban lines; there is little encouragement for the construction of suburban lines; all street railroad people and steam railroad people, too, realize the fact that there is no money in long hauls where a flat rate of five cents is charged. Every man who rides from Atlanta to College park for five cents loses this company money. It is the short-haul business which enables this loss to be made up and makes possible the construction of suburban trolley lines."

On February 27 the hearing on the petition to the Georgia railroad commission to compel the Georgia Railway & Electric Company, Atlanta, to give eight rides for 25 cents was begun at Atlanta. After two short sessions an adjournment was taken until March 5.

Chicago Elevated Road Traffic.—The average daily number of passengers carried by the South Side Elevated Railroad of Chicago in February was 111,927, an increase of 15,833, or 16.47 per cent, over February, 1907. The Northwestern Elevated Railroad carried an average of 102,182 passengers daily during February, an increase of 13,747, or 15.54 per cent. The Metropolitan West Side Elevated Railway carried an average of 145,427, a decrease of 9,016, or 5.83 per cent.

Warning to Teamsters.—As part of its effort to reduce accidents the Omaha & Council Bluffs Street Railway, Omaha, Neb., is advertising a warning "to persons driving vehicles," in which it says: "At this season of the year street car tracks are apt to be very slippery, owing to atmospheric conditions, and it is impossible, therefore, to stop a car as promptly as ordinarily. Remember that a street car is confined to the track and that the motorman cannot turn out or stop his car instantly when 'cut off' by a vehicle."

Interview on Prevention of Accidents.—An article headed "Stop, Look and Listen" is published in the Journal-Gazette of Ft. Wayne, Ind. It contains an interview with R. T. Gunn, superintendent of transportation Ft. Wayne & Wabash Valley Traction Company. Mr. Gunn is quoted in part as follows: "The exercise of a little judgment on the part of persons walking along and across streets would prevent a good many accidents. How many persons who start over a street crossing stop and look each way to see if a carriage or street car is approaching? It is a common occurrence for passengers to alight from a car and walk behind the standing car, directly in front of an approaching car on the other track. It is impossible for the motorman to see these people. The motorman not only has to operate his car, but also do a lot of thinking for people too careless to think for themselves. The accident nearly always happens at a time when the probability is reduced to a minimum."

Construction News

FRANCHISES.

Glasgow, Pa.—The Ohio River Passenger Railway has been granted a 100-year franchise to build a line through Glasgow. The company agrees to complete the line by July 1, 1908.

Greenville, Pa.—A franchise has been granted to the Mercer Construction Company for the building of a street railway in Greenville, Pa. Construction must be started within six months and completed within 18 months from the date of the franchise. It is stated that the company also has obtained right of way for an interurban line between Greenville and Mercer and between Mercer and Sharon. State Senator James M. Campbell is interested.

St. Louis, Mo.—The St. Louis Electric Terminal Railway Company has asked for an extension of time in which to complete its proposed electric line, which will enter St. Louis over a bridge across the Mississippi river, which is expected to be completed by next December. The franchise for building the road expires next October and as it is not considered desirable to operate the cars by ferry before the completion of the bridge one year's extension was asked. The road will be built by the Illinois Traction System. (Noted November 23, 1907.)

Toledo, O.—The Toledo Fostoria & Findlay Railway Company has applied for a perpetual franchise in Toledo, O. The road will enter the city on Oakdale avenue for a short distance and then use its private right of way along the east corporation line and adjoining the Bay Terminal Steam Railroad to a connection with the Toledo Railways & Light Company's tracks in Woodville avenue.

Tolleston, Ind.—The town board has granted a franchise to the Chicago Lake Shore & South Bend Railway, which is building from South Bend, Ind., to Kensington, Ill.

RECENT INCORPORATIONS.

Fruita Land & Power Company.—Incorporated in Colorado to build an electric railway from Debeque to Fruita, Cal., 40 miles; to build a power plant on the Grand river, and to develop an irrigating system for reclaiming 20,000 acres of land. It is stated that the Commonwealth Securities Company, Denver, Colo., has the financial management of the project. Horace K. Devereaux, president, Colorado Springs; J. Arthur Connell, vice-president; Orson Adams and E. A. Sunderlin, secretary and treasurer.

TRACK AND ROADWAY.

Anniston (Ala.) Electric & Gas Company.—It is reported that this company contemplates an extension of its line to the Blue Springs cotton mills in Oxford, Ala. R. S. Rand, general manager, Anniston, Ala.

Atlanta & Carolina Construction Company, Atlanta, Ga.—A contract has been signed with Cook & Lowry of Montgomery, Ala., for the construction of this company's electric line in Atlanta, Ga. Work is to be started in 60 days. The road will connect Atlanta and Augusta, Ga., by way of Washington, Crawfordsville, Athens, Monroe, Conyers and Lithonia, and will also connect Atlanta and West Point, Ga. The central terminus of the road will be at the corner of Center and Broad streets, Atlanta. James W. English, president, Atlanta, Ga. (Noted February 15.)

Brockville, Ont.—J. B. Gaughn of Brockville is said to be interested in a project to build an electric railway paralleling the St. Lawrence river from Brockville to Prescott, Ont., 16 miles, together with a street railway in Brockville and an amusement park at Maitland, half way between the termini.

Columbus Street Railway & Light Company, Columbus, Ind.—It is reported that John W. Crump, vice-president of this company, and Harold Larabee, manager of the Central Indiana Lighting Company, are interested in a proposed interurban line from Columbus to Hope, Ind., about 12 miles, the right of way for which is said to have been promised by residents along the proposed route. It is stated that power for its operation would be secured from the existing power plant of the company at Columbus. A park, to be established midway between the two towns, is part of the project.

Dayton (O.) Street Railway.—C. H. Bosler, president of the Dayton Street Railway Construction Company, Dayton, O., writes that his company will build seven miles of double-track

line from the southeastern to the northwestern corner of Dayton, extending through the principal business section of the city, and affording transportation facilities for the suburbs of Highlands, Riverdale and Dayton View. Its construction will conform to that of the existing lines through the city, although it will be entirely independent of any of the three companies now operating in Dayton. The overhead trolley will be suspended from iron poles and 73-pound 7-inch rail will be used. Alternating current will be purchased from the Dayton Lighting Company and will be transformed by the railway company for direct-current operation. C. H. Bosler, president and general manager, 816 Riebold building, Dayton; Dennis Dwyer, treasurer; J. J. Hall, secretary.

Dunnville Wellandport & Beamsville Electric Railway, Wellandport, Ont.—It is reported that William W. Umbenhauer, banker, Philadelphia, Pa., will finance this proposed electric line from Dunnville to Beamsville, Ont. Plans and estimates are being made and it is expected that work will be started this summer. James A. Ross, Wellandport, Ont., is president. (Noted December 28, 1907.)

Elizabeth, N. J.—It is reported that a company is being organized to build an electric railway between Elizabeth, Rahway, Carteret, Woodbridge and Perth Amboy, N. J., which it is said will form an important part of the Newark to Trenton trolley route. Ex-Senator Pettigrew of South Dakota is interested.

Ellwood City, Pa.—A company of local men has been organized and will apply for a charter to build an electric railway from Ellwood City to Butler, Pa., by way of Burnstown and Wurtemburg. It is stated that sufficient money has been raised for the preliminary surveys, which will be started as soon as the company has been incorporated. J. T. Meckler, John M. Curry, J. N. Kirker and J. C. Keith, all of Ellwood City, are interested.

Evansville Mt. Carmel & Olney Interurban Railway, Olney, Ill.—Adam Knopp, Olney, Ill., president of this company, writes that the preliminary organization has been effected and that permanent officers will be elected at a meeting to be held at Vincennes, Ind., this week. The road will have a total length of 75 miles, 33 of which will be in Illinois and 42 in Indiana. It will be built from Olney to Mt. Carmel, Ill., and from there cross the Wabash river to Evansville, Ind., serving several intermediate towns along the route. James W. Moore is secretary. (Noted January 4, February 15 and 22.)

Findlay-Marion Railway & Light Company, Findlay, O.—It is stated that this company has secured funds for the construction of its proposed 47-mile electric railway from Findlay to Marion, O., and that work probably will be started this summer. R. P. Hankey, Detroit, Mich., is president. (Noted May 25, 1907.)

Gainesville Whitesboro & Sherman Railway, Gainesville, Tex.—A party of Chicago capitalists and engineers has been inspecting the route of the proposed line from Gainesville to Sherman, Tex., 39 miles, with a view to financing the project. The first six miles out of Gainesville was graded in 1906, but work was suspended. John King of Gainesville is vice-president. (Noted December 21, 1907.)

Grafton (W. Va.) Street Railway.—This company is said to be planning the construction of an extension 1½ miles long through South Grafton to the west side. John T. McGraw, president, Grafton, W. Va. (Noted February 15.)

Grand Rapids (Mich.) Electric Railway.—C. J. Post, secretary, has issued a map of the lines proposed by this company, which radiate from Grand Rapids, Mich., to Grand Haven, Bay City, Kalamazoo and Battle Creek, with a line from Kalamazoo, Mich., to Montpelier and Fostoria, O.

Guadalajara, Mex.—Louis H. R. von Rencau, a mining engineer, is said to have secured power concessions on the Ameca and Mascota rivers in Mexico, for the operation of a proposed electric railway from Cuale to Las Penas, Mex., on the Pacific coast.

Houghton County Street Railway, Houghton, Mich.—We are officially advised that construction on this company's extension from Calumet to Mohawk, seven miles, and from Houghton to Pawesdale, Mich., 11 miles, will be started in May. W. H. McGrath, manager, Houghton, Mich.

Illinois Central Electric Railway, Canton, Ill.—This company is reported to have placed an order with the Ohio Brass Company for six miles of overhead material. The extension under construction from Canton to St. David, Ill., is expected to be ready for operation by April 1. The company is said to be planning an extension to Norris, Ill., about five miles. R. O. Sharon, general manager, Canton, Ill.

Iowa & Northwestern Railway.—It is stated that this company has contracted for the use of a water power at Quasqueton, Ia., with which to operate its road. The line is being built by the Empire Railway Construction Company, of which S. B. Howard is president.

Kansas City St. Joseph & Excelsior Springs Electric Railway, Kansas City, Mo.—This company has applied for an extension of two years' time in which to build the bridge over the Missouri river at Kansas City, in connection with its proposed double-track interurban line from Kansas City to St. Joseph and Excelsior Springs, Mo. Work on the bridge was to have been started in May of this year. Ira G. Hedrick, Kansas City, consulting engineer. (Noted May 4 and June 22, 1907.)

Lima & Toledo Traction Company, Lima, O.—The plans for the proposed drawbridge of this company over Swan creek have been approved at a public hearing held by Colonel Townsend of the United States corps of engineers. The bridge will be located between the Clover Leaf bridge and the Huebner Toledo Breweries Company's plant. (Noted February 15.)

Lima-Honeoye Electric Light & Railroad Company, Lima, N. Y.—E. D. Watkins, manager, writes that the company is meeting with success in securing stock subscriptions from residents along the line and that the data which have been collected showing the tonnage shipped by the farmers and merchants during 1907 make an excellent showing. It is planned to begin construction as soon as subscriptions amounting to $75,000 have been secured. Lupfer & Remick, Buffalo, N. Y., will probably do the engineering work.

Nelsonville Athens & Glouster Traction Company, Nelsonville, O.—We are advised by C. W. Juniper, secretary, that this company has secured franchises in all the cities and villages along the proposed route and that considerable right of way has been acquired. While the plans are not fully matured it is expected that construction will be started on the Nelsonville-Athens section this spring. The line will be operated either by electricity or gasoline motors. It will serve the following cities and towns: Nelsonville, New Floodwood, Chauncey and Athens. A line also will be built from Chauncey through Jacksonville, Glouster, Murray City, Buchtel and back to Nelsonville. L. F. Carpenter, president; C. W. Juniper, secretary; Charles Tutt, general manager, all of Nelsonville, O.

Northern Electric Company, Chico, Cal.—This company has decided upon the permanent route for its proposed extension from Chico to Red Bluff, Redding and Kennett, Cal., and the work of securing right of way will be started immediately. It is stated that the company will soon start work on the construction of its proposed line from Marysville to Colusa and that shortly afterward work on the Red Bluff-Redding section will be begun. A. D. Schindler, general manager, Chico, Cal.

Oklahoma City Rapid Transit Railway, Oklahoma City, Okla.—Engineers are said to be at work out of Shawnee, Okla., on the survey for the proposed route of this company, which was incorporated last spring to build an electric railway from Oklahoma City to Norman, Shawnee and Muskogee. George E. Silsby, Saginaw, Mich., E. W. Milburn and others of Tecumseh, Okla., are interested. (Noted April 13, 1907.)

Oregon Electric Railway, Portland, Ore.—It is stated that this company will let contracts during the next three months for its proposed 21-mile branch to Hillsboro, Ore. Guy W. Talbot, vice-president and general manager, Portland. (Noted December 14, 1907.)

Paris & Subiaco Traction Company, Paris, Ark.—Major Henry Stroup, chief engineer of this company, is reported as announcing that all of the right of way has been secured and that work will be started this spring. The line will connect Paris, Ark., with the monastery of the Benedictine monks at Subiaco in Logan county and will develop the coal fields of that section. D. J. Young, Conrad Elsken, G. G. Dandridge, Henry Stroup and Charles J. Jewett are interested. (Noted February 15.)

Portland Eugene & Eastern Railway, Portland, Ore.—L. N. Roney, contractor, is making arrangements for the construction of a bridge across the Willamette river on the line from Eugene to Salem, Ore. A. Welch, chief engineer. (Noted January 4.)

Public Service Railway, Newark, N. J.—Surveyors are at work on a route for a new electric line which it is stated this company will build between Upper Montclair and Paterson, N. J. The present communication between the two cities is afforded only by a detour of several miles, which the new road will shorten.

Portland Railway Light & Power Company, Portland, Ore.—It is reported that this company will build a 4-mile extension to the proposed Swift packing plant as soon as work on the buildings is well under way. F. I. Fuller, general manager, Portland, Ore.

Quebec & Saguenay Electric Railway, Quebec, Ont.—It is reported that construction on this railway will be commenced in the spring. It is intended that the line, when completed, shall connect Quebec with St. Catharines Bay, a distance of about 155 miles. The route has been surveyed from Cap Tourmentine, the terminus of the Quebec Railway Light & Power Company's railway, to Murray Bay, 56 miles, and it is on this portion that it is understood the work will be rushed, with a view to its completion within a year. R. Forget is the promoter.

Roanoke Railway & Electric Company, Roanoke, Va.—Work on the construction of two new city lines is to be started by this company in the near future. J. W. Hancock, general manager, Roanoke, Va.

San Angelo Traction Company, San Angelo, Tex.—Col. J. H. Ransom, Hereford, Tex., president and general manager of the proposed electric railway in San Angelo, states that the line will be three miles long. The franchise which was secured some time ago expires next September and it is stated that work will be started in the near future on the first mile of track. J. A. Williams, secretary and treasurer. (Noted February 15.)

Traverse City, Mich.—Bond subscriptions are being received for the purpose of building an electric railway from Traverse City to Charlevoix, Mich., and it is proposed to begin work this spring. The Carter Construction Company of Indianapolis is interested.

Warren Cortland & Jefferson Traction Company.—C. G. Phillips, Cortland, O., one of the promoters of this road, is said to be negotiating with the Mohawk Construction Company of Boston, Mass., for the construction of the road.

POWER HOUSES AND SUBSTATIONS.

Albany & Hudson Railroad, Hudson, N. Y.—It is stated that this company is planning for the immediate installation of additional power equipment and boilers in its power plant at Stuyvesant Falls, N. Y. R. H. Smith, general manager, Albany, N. Y.

Coney Island & Brooklyn Railroad, Brooklyn, N. Y.—This company has contracted with A. Pasquini, 1123 Broadway, New York City, for the construction of a new power house to be located at Smith and Ninth streets, Brooklyn, and with John B. Roberts & Co., 1 Madison avenue, New York City, for the erection of two substations, one to be located at De Kalb avenue and Sanford street and the other at Coney Island and Q avenues. The buildings are to be of brick construction.

Fruita Land & Power Company.—This company, which was recently incorporated in California for the construction of an electric railway from Debeque to Fruita, Cal., and to develop an irrigation system for reclaiming a large tract of land, will build a power plant on the Grand river near Debeque, work on which is said to have been started. It is stated that 6,656 horsepower will be developed. Horace K. Devereaux, Colorado Springs, Colo., is president.

Northern Texas Traction Company, Ft. Worth, Tex.—Early last fall plans were made to enlarge the Handley power station by the installation of a new 1,500-horsepower engine direct connected to a 1,000-kilowatt generator and by the installation of 1,000 horsepower in boilers, with the necessary pumps, condensers, etc. The work was stopped temporarily in November, but it is hoped to have the boilers in operation by March 15. The engine and generator will probably be in operation some time during the summer.

Oregon Electric Railway, Portland, Ore.—It is announced that a contract for the building of a substation will be let by this company within the next three months. Guy W. Talbot, vice-president and general manager, Portland.

San Angelo (Tex.) Traction Company.—This company proposes to install an electric power plant for a street railway. A brick building 38 by 52 feet will be erected and bids will be asked shortly for the electrical equipment.

Schenectady (N. Y.) Railway.—This company has recently put in operation a new substation at Karners, N. Y., which was described in the Electric Railway Review of June 22, 1907. The building is 73 by 57 feet in area, of stone, brick and steel construction and replaces an old frame structure. The equipment includes four 300-kilowatt rotary converters and twelve 10,000-volt air-cooled transformers.

Personal Mention

Mr. Benjamin H. Glover has resigned as superintendent of motive power of the Metropolitan West Side Railway of Chicago, Ill.

Mr. J. L. Sullivan, master mechanic of the St. Francois County Electric Railway, Farmington, Mo., has resigned, effective on March 9.

Mr. G. F. Moore, general manager St. Joseph Valley Railway, at La Grange, Ind., has resigned to become inspector of general accounts for the interstate commerce commission, with headquarters at Washington, D. C.

Mr. W. F. McCloud, assistant auditor of the Indianapolis & Cincinnati Traction Company at Rushville, Ind., has resigned, effective on March 1, to take charge of the accounting and system work of the Prestolite Company in the general offices of the company at Indianapolis, Ind.

Mr. George H. Shaw has been appointed superintendent of the La Crosse City Railway, succeeding Mr. S. B. Livermore, resigned; effective on March 1. Mr. Shaw was formerly superintendent of the Southern Wisconsin Railway, Madison, Wis., having held this position for 18 years.

Mr. E. C. McCarthy, purchasing agent of the Savannah (Ga.) Electric Company, has been appointed district manager of the southeastern states for Stone & Webster, succeeding Mr. H. H. Hunt. Mr. E. T. Steel, formerly with the Ponce (Porto Rico) Railway & Light Company, has been appointed to succeed Mr. McCarthy at Savannah.

Mr. P. W. Gerhardt has been appointed assistant superintendent of the Minneapolis division of the Twin City Rapid Transit Company of Minneapolis, Minn. Mr. Gerhardt graduated in 1905 from Purdue University and until the latter part of January, 1908, was connected with the testing department of the General Electric Company.

Mr. E. C. Deal, who has been superintendent of the Bergen county division of the Public Service Corporation of New Jersey for several years, has been transferred to Elizabeth, N. J., where he will have general supervision of the Central division, comprising the lines in Union, Middlesex and Somerset counties, this division previously having been in charge of several divison superintendents.

Mr. Frank T. Buchanan, who for the past few months has been in the statistical department of Stone & Webster, Boston, Mass., has been appointed superintendent of the Blue Hill Street Railway, Canton, Mass., effective on February 19. Mr. Buchanan formerly was superintendent of the Cape Breton Electric Company, Sydney, N. S., and more recently was in charge of the Key West Electric Company lines at Key West, Fla., both of which are operated by Stone & Webster.

Mr. F. F. Barbour has been appointed assistant to President B. F. Josselyn of the Portland Railway Light & Power Company, Portland, Ore., effective on March 1. Mr. Barbour has been special agent for the General Electric Company at San Francisco and has had an extended experience in electric railway and lighting construction and operation. In his new position he will relieve the president of much of the detail work and afford Mr. Josselyn an opportunity to devote his time to the personal direction of the more general and important matters.

At the annual meeting of the Schenectady (N. Y.) Railway on March 2 Mr. C. S. Sims, vice-president and general manager of the Delaware & Hudson Company, was elected vice-president; Mr. A. L. Linn, Jr., general auditor of the Mohawk Valley Company, New York City, was elected general auditor; and Mr. D. C. Diebell, auditor of the United Traction Company, Troy, N. Y., was elected auditor, succeeding Mr. Frederick Ruby, resigned. Mr. A. H. Harris, general counsel of the New York Central Lines, and Mr. Edgar S. Fassett, general manager of the United Traction Company, were added to the board of directors.

Mr. Edward B. Kirk, general manager of the Sterling Dixon & Eastern Electric Railway, Dixon, Ill., has resigned, effective on March 1, to become general manager of the Atlantic Shore Line Railway, Kennebunkport, Me., succeeding Mr. W. G. Meloon, resigned. Mr. Kirk is a graduate of the electrical engineering department of Purdue University and for several years was superintendent of the Jacksonville (Ill.) Railway & Light Company. Later he was appointed electrical engineer and master mechanic of the Grand Rapids Grand Haven & Muskegon Railway, Grand Rapids, Mich., and more

recently was vice-president and general manager of the Winnebago Traction Company, Oshkosh, Wis. He resigned from this position last July to become general manager of the Sterling Dixon & Eastern Electric Railway at Dixon, succeeding Mr. Henry C. Higgins.

Mr. F. E. Reidhead, who has recently been transferred from Columbus, Ga., to Paducah, Ky., as manager of the Paducah Traction Company and other properties of Stone & Webster of Boston, succeeding Mr. John S. Bleecker, has been manager of the Stone & Webster properties at Columbus for about three years. About five years ago he became superintendent of the Columbus Railroad and two years later, when the Gas Light Company of Columbus and the Columbus Power Company were acquired by Stone & Webster, he was given charge of the three properties with the title of manager. Before going to Columbus he was general superintendent of the Minneapolis General Electric Company. At Paducah Mr. Reidhead will have charge of the lighting and power interests as well as of the street railway. Mr. Bleecker has been transferred to Columbus to succeed Mr. Reidhead, as previously reported.

Mr. H. A. Fisher, whose portrait is presented herewith, is president of the Joliet & Southern Traction Company, operating the Joliet Plainfield & Aurora Railroad, and has recently of the Bloomington Pontiac & Joliet Electric Railway, with headquarters at Joliet, Ill. Mr. Fisher is a native of Ohio and began his career in the newspaper business, having been at one time editor and publisher of the Elyria Republican. In 1878 he left the newspaper business and became general eastern immigration agent of the Union Pacific Railroad at Toledo, O. He was later assistant general passenger agent of the Wabash Railroad, and then assistant general passenger and ticket agent of the Missouri Pacific Railway at St. Louis. In 1886 he resigned and has since been elected president been engaged in the construction and operation of railroads. In December, 1899, he went to Columbus, O., and associated himself with the electric railway construction work in that vicinity. In October, 1903, he resigned as general manager of the Columbus Delaware & Marion Railway to go to Joliet as president of the Fisher Construction Company, which built the Joliet Plainfield & Aurora Railroad.

H. A. Fisher.

Hon. James F. Shaw has resigned as president and general manager of the Boston & Worcester Street Railway and the Boston & Worcester Electric Companies of Boston, Mass., in order to devote more of his time to other affairs. He is now serving his second term in the state senate. Mr. Shaw is first vice-president of the American Street and Interurban Railway Association. Mr. William M. Butler has been elected president of the Boston & Worcester Street Railway and Mr. Arthur E. Child has been elected president of the Boston & Worcester Electric Companies, which is a holding organization for the street railway. Mr. Childs has been vice-president of the holding company.

Mr. Alexander Jackson has resigned as chief dispatcher of the Brooklyn Rapid Transit Company, Brooklyn, N. Y., to accept a similar position with the Public Service Railway of Newark, N. J. Mr. John Weigel has been appointed to succeed him. Mr. Jackson began his service with the company in 1895 as conductor and has served as inspector, clerk in the timetable department and chief of that department. From July, 1903, to August 15, 1906, he was in charge of schedules for the Public Service Corporation of New Jersey. Mr. Weigel started as a motorman at the same time as Mr. Jackson, and after some experience in the shops, became successively inspector, general inspector, assistant division superintendent, clerk and then chief of the timetable department, and chief dispatcher of surface lines. He went with the Public Service Corporation when Mr. Jackson came to the Brooklyn Rapid Transit Company in 1906 and now exchanges positions with him.

Financial News

Chicago City Railway.—Judge Ball of the Cook superior court has dismissed the bill filed by C. H. Venner to enjoin this company from operating under its franchise.

Chicago Railways Company.—The special master's deed conveying the properties of the Chicago Union Traction Company to the Chicago Railways Company has been filed of record.

Chicago & Milwaukee Electric Railroad.—Holders of a majority of the $10,000,000 bonds of the Chicago & Milwaukee Electric Railroad of Wisconsin have appointed the following committee to represent bondholders, with authority to consent to an issue of receivers' certificates of not to exceed 10 per cent of the total amount of the bond issue: John V. Clarke and C. B. Shedd of Chicago, and Miller Lash, George A. Somerville and Robert Cassels of Toronto. Holders of this issue of the bonds will be requested to deposit them with the Chicago Title & Trust Company or the National Trust Company of Toronto. A bondholders' protective committee has been organized to represent the holders of Chicago & Milwaukee Electric Railroad, Illinois division, 5 per cent bonds. F. J. Lisman of New York is chairman of the committee.

Columbus Delaware & Marion Railway, Columbus, O.—A meeting of shareholders will be held on March 27 to vote on an increase of the capital stock from $2,500,000 to $3,000,000.

Delaware River & Atlantic City Railroad.—Vice-Chancellor Leaming, Camden, N. J., entered an order on February 27 to show cause why a receiver should not be appointed for this company. The application was made by William Harris, attorney on behalf of Charles T. Maloney of Woodbury, N. J., a stockholder. Pending the return of the order the corporation was restrained from transacting any business except that which pertains to the proceedings in court. The bill filed states that the company was incorporated on July 11, 1899, with a capital of $6,000,000, to construct an electric railway from the foot of Ferry street, Gloucester City, to the foot of Florida avenue, Atlantic City. The company is indebted to various persons. The complainant asserts that the suspension of efforts to finance, build and operate the railway was caused by a want of funds to carry on the work, and that the company cannot resume its business at any time hereafter with safety to the public and advantage to the stockholders.

Des Moines (Ia.) City Railway.—Gross earnings in 1907 were $779,059 and operating expenses were $559,550, leaving net earnings of $219,509. Taxes were $21,596 and interest amounted to $158,991, leaving a surplus of $38,922. From the latter $22,221 should be deducted on account of depreciation, leaving a final surplus of $16,701.

Havana (Cuba) Electric Railway.—Gross earnings in 1907 were $1,810,888, as compared with $1,570,302 in 1906. Net earnings were $846,156, as compared with $612,591.

Indiana Union Traction Company, Anderson, Ind.—At the annual meeting of shareholders on March 3 the directors were elected. The earnings for 1907 were published in the Electric Railway Review of February 22, 1908, page 249.

Interborough-Metropolitan Company, New York.—T. P. Shonts, the president, has offered the Steinway tunnel to the city of New York for $7,239,477. Mr. Shonts estimates in his letter that the New York & Long Island Railroad and the corporation which controls it, the Interborough Rapid Transit Company, have expended this sum in the construction of the tunnel, purchase of real estate necessary for right of way, interest charges, etc. About $412,110, it is figured, has been expended for real estate not needed in the operation of the tunnel, but that amount is not included in the total. In payment for the property the company would accept 4 per cent bonds of New York City at par. Mr. Shonts suggests that the city make a contract with the New York & Queens County Railway, which is controlled by the Belmont interests, to operate the tunnel for 25 years upon the following terms: "The expenses of operation to be fixed by agreement at an arbitrary sum to represent the estimated cost, one-half of the sum to be paid by the city, the balance to be met by the company. A single fare of five cents to be charged between Forty-second street and Fourth avenue, Manhattan, and any point on the line of the New York & Queens County Railway."—It is expected that an issue of $50,000,000 bonds will be made soon by the Interborough Rapid Transit Company, bearing 5 per cent interest and secured by a first mortgage on the power

house and rolling stock, the Steinway tunnel and the Long Island traction properties owned by the company. According to the plan the company will sell $20,000,000 of the proposed bonds now and use the proceeds to retire $15,000,000 notes maturing on May 1 and $5,000,000 floating debt, provided bond market conditions are favorable. If conditions are unfavorable the bonds will be used as collateral security for a new issue of notes. Earnings of the Interborough Rapid Transit Company for the year 1907, with comparisons, follow:

	1907.	1906.	1905.
Gross	$23,513,172	$20,916,147	$18,218,266
Expenses	10,316,527	8,793,486	8,245,005
Net	$13,196,645	$12,122,661	$ 9,973,261
Other income	1,146,322	673,598	701,661
Total income	$14,342,967	$12,796,259	$10,674,922
Interest on bonds	*4,772,568	3,961,992	3,018,166
Taxes	†1,537,977	1,341,074	1,288,614
Total interest and taxes	$ 6,310,545	$ 5,303,066	$ 4,306,780
Net income	8,032,422	7,493,193	6,368,142
Seven per cent on Manhattan Railway stock	4,200,000	3,948,000	3,864,000
Surplus	$ 3,832,422	$ 3,545,192	$ 2,504,142
Dividends	3,150,000	3,062,500	.....
Surplus	$ 682,422	$ 482,692	$ 2,504,142
Operating percentage	43.90	42.09	45.26

*Includes $3,745,902 interest on bonds, $1,016,666 interest on 3-year notes and $10,000 rental. †Taxes include $162,940 on real estate, $202,469 on earnings, and $1,172,568 on structure and personal property.

London (Ont.) Street Railway.—Gross earnings in 1907 were $232,377, an increase of $29,465 over 1906. Expenses were $168,025, of which $41,574 was devoted to maintenance, $32,883 to power plant expense, $65,865 to car service and $27,703 to general expense. Net earnings were $64,352, and after provision for charges of $27,229, the net income was $37,123. Henry A. Everett, the president, refers in the report to stockholders to the erection during the year of a car house and terminal, and to the negotiations started by a committee from the city council for the purchase of the property by the municipality. When the city has legal authority to purchase negotiations will be entered into. An additional issue of $50,000 bonds will be disposed of to offset the bank overdraft caused by additions to the property. The report contains a statistical statement, compiled by George H. Bentson, secretary and treasurer, concerning the operations from the year 1896 to 1907, inclusive. Some of the figures follow:

	1907.	1906.	1896.
Expenses, per cent of earnings	72.3	78.5	57.5
Per car-mile, cents—			
Gross earnings	16.18	15.48	11.02
Operating expenses	*11.70	*12.16	6.34
Net earnings	4.48	3.32	4.68
Gross earnings per mile of track	$6,989	$6,452	$3,990

*Taxes included.

Market Street Elevated Passenger Railway, Philadelphia.—Edward B. Smith & Co. of Philadelphia, in a circular offering for sale a block of the $10,000,000 of 4 per cent mortgage bonds, state that according to an official estimate the road when completed, in the latter part of this year, will receive fully $1,500,000 in cash fares per annum. Operating expenses, they say, are expected to be under 50 per cent. The western part of the system has been in operation for more than a year and it is now carrying about 45,000 passengers daily.

Metropolitan Street Railway, New York.—The Guaranty Trust Company of New York, as trustee under the general collateral mortgage of 1897, has brought a foreclosure suit in the United States circuit court at New York.

New York New Haven & Hartford Railroad.—A report has been filed in the Massachusetts supreme court by Winfield S. Slocum, master in chancery, in connection with the suit filed by Attorney-General Malone of Massachusetts against the ownership of street railways in that state by the New York New Haven & Hartford Railroad. An abstract of the report follows: "The directors of the New York New Haven & Hartford Railroad acquired the stock of the Worcester & Connecticut Eastern Railway, which afterward became the Consolidated Railway Company, which acquired additional powers from Connecticut and did acquire stocks, bonds and securities of street railways named in the information, excepting those of the Springfield Street Railway. The Consolidated Railway Company acquired all the stock of the Worcester & Southbridge Street Railway, the Worcester & Blackstone Valley Street Railway, the Webster & Dudley Street Railway, the Worcester & Webster Street Railway and a majority of the stock of the Berkshire Street Railway. The Consolidated Railway Company did not directly acquire a majority of the stock of the Springfield Street Railway, but it entered into agreements for the organization of the Springfield Railway Companies and made an agreement with that association, guaranteeing certain dividends on its preferred stock and guaranteeing a certain price upon the preferred stock in a certain event, and the Springfield Railway Companies did acquire a majority of the stock and securities of the Springfield Street Railway. The Consolidated Railway Company has continued to hold the entire capital stock of the Worcester & Webster and the Webster & Dudley street railways. Upon June 25, 1906, the voluntary association known as the New England Investment & Security Company was formed and the Consolidated Railway Company sold and conveyed to it all of the stocks, bonds and securities which it held in the Worcester & Southbridge Street Railway, the Worcester & Blackstone Valley Street Railway, the Berkshire Street Railway and the Springfield Street Railway. The plan of organization of the New England Investment & Security Company was reported to and approved by the directors of the New York New Haven & Hartford Railroad, and an agreement as to the guaranty of its stock was made between the New York New Haven & Hartford Railroad and the Consolidated Railway Company and the New England Investment & Security Company; and the Consolidated Railway Company was a party to the agreement and declaration of trust. Most of the trustees and officers of the New England Investment & Security Company are persons who are directors and officers of the New York New Haven & Hartford Railroad and of the Consolidated Railway Company."

South Side Elevated Railroad, Chicago.—The directors have sent a letter to shareholders in which they say: "The directors desire to notify you that in pursuance of the established policy of this company to keep upon a conservative and strictly cash basis they have decided that for the present the dividends should be reduced from a 4 to a 3 per cent basis. The extensive third track and branch construction was greatly delayed by a long strike against the contractors for this work. This interfered with our traffic and prevented the growth of business, which, if no delay had occurred, would naturally have resulted before this time. There has been since October a loss of patronage from the general recession in business, but there are indications that this loss will disappear. Meanwhile the directors wish to keep on hand the usual cash surplus, and also provide funds for the purchase of more cars and the like, without resorting to a floating debt or any of the modern railroad financing, such as the issue of car purchase certificates or the like."

Third Avenue Railroad, New York.—Judge Lacombe of the United States circuit court, New York, has authorized the issue of the following receivers' certificates: Dry Dock East Broadway & Battery Railroad, $100,000 for 25 new cars and taxes; Forty-second Street Manhattanville & St. Nicholas Avenue Railroad, $200,000 for 50 cars and taxes. The certificates bear 6 per cent interest and mature in one year from the date of issue.

Toledo & Indiana Railway, Toledo, O.—On March 2 $100,000 bonds of this company, dated January 1, 1903, and maturing on January 1, 1928, were sold at auction at Toledo, O., to J. M. Longnecker of Delta, Ind., at 50 per cent of par. The bonds were held as collateral security for the payment of a note.

United Traction Company, Albany, N. Y.—George P. Hilton, president of the chamber of commerce of Albany, has been elected a director to succeed James F. McElroy, resigned.

West Chester Kennett & Wilmington Electric Railway, West Chester, Pa.—This company has absorbed the property of the controlled Oxford West Grove & Avondale Street Railway, Avondale, Pa.

West End Street Railway, Boston.—This company sold at auction in Boston on February 26 the portion of the new issue of 20,218 shares not acquired by shareholders. The stock was bought by Towle & Fitzgerald of Boston at 80¾ and accrued dividend a share.

Western Ohio Railway, Lima, O.—Gross earnings in 1907 were $444,846, as compared with $385,619 in 1906.

Dividends Declared.

Galveston-Houston Electric Company, preferred, 3 per cent.

Manufactures and Supplies

ROLLING STOCK.

Illinois Traction System, Champaign, Ill., is asking prices on 60 cars.

Toledo Urban & Interurban Railway, Toledo, O., has purchased three freight trail cars from Niles Car & Manufacturing Company.

Ottawa Electric Railway, Ottawa, Ont., has placed an order with the Preston Car & Coach Company of Preston, Ont., for two single-truck cars.

Westside Electric Street Railway, Charleroi, Pa., has placed an order with the G. C. Kuhlman Car Company for two 10-bench open motor cars.

Southwestern Traction Company, London, Ont., has placed an order with the Preston Car & Coach Company of Preston, Ont., for six double-truck interurban cars.

Chicago Railways Company will receive bids on March 7 for 300 double-truck pay-as-you-enter type cars, as previously reported in the Electric Railway Review. We are officially advised that these bids will be passed upon by the board of supervising engineers before the contracts are closed.

Pay-As-You-Enter Car Company, 26 Cortlandt street, New York, has closed contracts with the United Railways Company of St. Louis and The Milwaukee Electric Railway & Light Company whereby the pay-as-you-enter system of fare collection will be used on the new cars of the St. Louis railway and on new and rebuilt cars for the Milwaukee lines.

St. Louis Car Company is at the present time engaged in building and shipping cars for the Utah Light & Railway Company, Pittsburg Railways, the Little Rock Railway & Electric Company, the Denver & Interurban Railroad, Northwestern Pacific Railroad, Penn & Franklin Street Railway, Texas Traction Company, Metropolitan Street Railway of Kansas City, San Bernardino Valley Traction Company, Manaos Railway Company of Brazil, and has booked a number of small orders for various roads. The cars for the Little Rock Railway & Electric Company are now being shipped. Mr. Hegerty, general manager of this property, has been highly complimented on the general design and handsome appearance of the new equipment.

Winnebago Traction Company, Oshkosh, Wis., which was reported in the Electric Railway Review of February 29 to be in the market for six cars, has placed an order with the American Car Company for four standard Narragansett 15-bench open car bodies, to be mounted on St. Louis Car Company's trucks, with four G.E. motors and Christensen air brakes. In addition to these cars the company will buy two single-truck closed cars, similar to those now in service on the road. The details have not been decided upon. Contracts have been placed with the Baldwin Locomotive Works for eight Class 78-25 electric motor trucks and with the Allis-Chalmers Company for four Bullock 50-horsepower railway motors and AA-4 air brake equipment.

SHOPS AND BUILDINGS.

Chicago (Ill.) City Railway.—Plans have been prepared for a large car house at West Sixty-ninth street and Ashland avenue. It will have a capacity of 250 cars.

New York City Railway.—The car barns of this company, occupying the entire block between First and Second avenues and Ninety-sixth and Ninety-seventh streets, New York, were destroyed by fire on February 29. The fire originated in the paint shop on the second floor, where 72 cars were being repainted, and because of the abundance of combustible material on this floor spread so rapidly that it was impossible to save any part of the building. The number of cars destroyed cannot at this time be accurately learned, but the total number will be in the neighborhood of 450. The loss is estimated at $1,000,000.

TRADE NOTES.

Hicks Locomotive & Car Works, Chicago, has appointed the Empire Steel & Equipment Company, 141 Broadway, New York, its eastern representative.

Omaha Electrical Show.—An electrical show will be held in Omaha, Neb., April 13 to 18, under the auspices of the Nebraska Electrical Trades Association. The exhibition will be held in the Auditorium, a building affording about 30,000 square feet of exhibit space. F. A. Nash, president of the Omaha Electric Light & Power Company, is president of the association.

Indianapolis Switch & Frog Company, Springfield, O., has rebuilt its plant, which was destroyed by fire, and is now prepared to fill orders for frogs, switches, crossings and track material.

Wheeler Condenser & Engineering Company announces the removal of its general offices to the factory at Carteret, N. J. The New York sales office will, however, be retained at 90 West street, under the management of George D. Atwood.

R. Woodman Manufacturing Company of Boston has recently sent a third order of punches to the Wellington Corporation Tramways of Wellington, New Zealand, and the County Borough Brighton, England, has also ordered extensively.

C. L. Richards, formerly with the Metropolitan West Side Elevated Railway of Chicago and the Interborough Rapid Transit Company, New York, has joined the mechanical expert staff of the Galena-Signal Oil Company, Franklin, Pa. For the time being Mr. Richards will make his headquarters in the company's New York office.

Carlyle-Johnson Machine Company, Hartford, Conn., has recently received an order for 30 of its direct-line shaft-driven clutches from the Remington Arms Company, Bion, N. Y.; from William Sellers & Co., Philadelphia, an order for 119, which will be used in the new shop of Wolf Brothers in Philadelphia; and from the Mergenthaler Linotype Company an order for 41.

Adreon & Co., Security building, St. Louis, Mo., recently appointed sales agents of the Steel Car Forge Company of Pittsburg, report that they have secured for this company an order of 95,000 tie plates, from the United Railways Company of St. Louis. The entire roadbed, on paved streets, will be embedded in concrete and a base plate alternated with a flat one. The plates are made of $\frac{5}{16}$-inch open-hearth steel.

Wisconsin Engine Company of Corliss, Wis., has received the resignation of Frank Engelhardt, who was in charge of the Chicago sales office of the company. The Wisconsin Engine Company has decided to close the Chicago office on March 1, and for the time being to conduct the business from that district under the direct charge of C. T. Myers, general sales manager at Corliss.

Telegraph Signal System and its method of operation are fully described and illustrated in a 4-column article in Public Service for March. The Telegraph Signal Company, Rochester, N. Y., Chauncey P. Button, general manager, is the manufacturer of the Telegraph Signal System, which includes new devices for placing the semaphore blades along a railway route within the complete control of a dispatcher located at any convenient place.

E. H. Symington, manager western sales of the T. H. Symington Company, Baltimore, who suffered a fractured skull by being thrown from his horse in Chicago nearly a year ago, recently returned from a trip around the world, taken in an effort to regain his health. Mr. Symington's doctors now advise him not to return to his work for another six months, and he left on February 26 for another tour. The last time he went via Japan, China, Ceylon, India, Egypt and Europe; this time he is going to South Africa, thence to Tasmania, Australia, New Zealand, Buenos Aires, Rio de Janeiro and Madeira. He hopes to be at work again in his office in the Railway Exchange building, Chicago, by fall.

W. C. Lawson and **J. E. Simons** have formed a partnership under the name of Lawson & Simons, as selling agents for various companies. At present they are prepared to handle long-leaf yellow pine, oak, fir, creosoted lumber, ties, piling, telegraph and trolley poles, tool steel, bolts and nuts, bar iron and steel. Mr. Lawson's experience with the American Car & Foundry Company, and as salesman for the Pressed Steel Car Company and Scullin-Gallagher Iron & Steel Company, and Mr. Simons' varied experience as a railroad mechanical man, combined with his recent commercial experience with the Fitz-Hugh, Luther Company, would seem to assure a successful organization. The new firm's office is located at 505 Fisher building, Chicago.

E. S. Averill has connected himself with the Chicago Bailey Company, 260 South Clark street, Chicago, as general sales manager. Mr. Averill was general superintendent of the United States Express Company for 12 years, and more recently was vice-president of the Copper Belt Mines Company. He is well known to railway men in both the east and west through his connection as manager of the express business of the Baltimore & Ohio, Erie and Chicago Milwaukee & St. Paul. The Chicago Bailey Company is the sole manufac-

turer and distributor of "The Chief's Own" metallic packing, which is made to fit any pistons, valves or stems, and is manufactured on specifications. The company states that this packing has been adopted by the United States government for use on its war ships, as well as on stationary plants in its buildings.

Westinghouse Electric & Manufacturing Company advises us that the United States circuit court of appeals for the district of New Jersey has sustained the opinion rendered some time ago in favor of it against the Prudential Insurance Company of Newark, N. J. This suit was brought by the Westinghouse company against the Prudential to restrain it from further infringement of Nolan patent No. 582481, in the use of a direct-current generator manufactured by the Bullock Electric Manufacturing Company, and the United States circuit court district of New Jersey, held that claims 2 and 4 of the patent are valid and infringed by the use of the Bullock generator in question. The feature of the direct-current generator to which this patent relates is the means used for clamping the armature laminæ in place, and the particular feature is the means for holding the movable clamping ring or flange in position, a split ring partially located in a circumferential groove in the armature spider being used to hold the clamping plate in position, the ring itself being held from centrifugal movement by a shoulder upon the clamping plate. This is an important feature of construction, as it obviates the use of bolts passing through the laminæ for the purpose of holding them together.

The Brady Brass Company, in its litigation with the Ajax Metal Company, has received a favorable decision from the United States circuit court of appeals for the third district of New Jersey, reversing the decision of the lower court. The case has been in the courts since 1903, and was argued on appeal in December last in Philadelphia. The Ajax Metal Company set up the claim that it had invented and patented an alloy capable of holding up within itself more lead than had been previously possible without the use of nickel, and had thus produced a bearing consisting of less than 7 per cent of tin and more than 20 per cent of lead, and the balance copper. The validity of the patent, which was sustained by the trial court, is denied in the decision just rendered. In passing upon the claims of the plaintiff the court says that "the patent is for a product and not for a process. There is no claim for any particular method of combining the constituents of this alloy, and the specification only states the ordinary foundry practice well known and recognized by those skilled in the art." Discussing the metallurgical features, the court says that points upon which the Ajax company bases its claim for novelty of invention were all known and well understood by the trade long before the application for patent. The evidence of experts like Dr. Charles B. Dudley of the Pennsylvania Railroad, Prof. John W. Langley, Dr. Charles F. Chandler and Dr. Joseph W. Richards, is quoted to confirm the main point, that the alloy in question was not patentable, as it "differed in degree and not in kind" from that which had been on the market for a long time. Concerning the claim that the Ajax company had discovered a "critical point," so-called, in copper-tin alloys, the court quotes the testimony of Dr. Albert Sauveur to show that the so-called "critical point" was known at least three years prior to the application for the patent in litigation "by all students who had conducted the necessary experiments." In concluding the opinion the court says: "A mere difference in the proportions of the constituents of an alloy, however useful the result may be, does not entitle the originator to the monopoly of a patent in the absence of other circumstances than those here disclosed. Being of the opinion that the patent in suit is invalid, it is unnecessary to consider other grounds of defense, though we may be permitted to say that the prior public use set up in the answer of the defendant seems to us to have been sustained by the testimony."

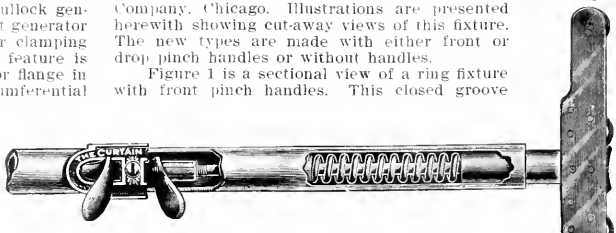
ADVERTISING LITERATURE.

General Electric Company, Schenectady, N. Y.—New publications include a handsome booklet, known as Bulletin No. 4548, devoted to the application of small motors to machine tools. It illustrates typical examples of direct and alternating current motors installed on a great variety of lathes, drills, grinders, punchers, shears, boring mills and similar tools, which are suggestive of their almost limitless adaptability to this character of service. A short description of typical General Electric motors, rheostats and controllers is followed by 15 pages of excellent halftone illustrations showing the motors installed on tools of various manufacturers, and running from small portable drills to heavy punches, boring mills and engine lathes. The pamphlet is bound in a light green cover bearing in reproduction a photograph of the interior of an electrically driven shop.—One of the most artistic electric fan catalogues of the season is Bulletin No. 4560. It is conveniently arranged for reference, two or three fan motors being shown on each page with a brief description in tabulated form and data as to voltage, catalogue numbers, list prices, etc. Descriptions are included of ceiling fans, exhaust fans and some miscellaneous small motors for blowers, drills, buffing and polishing machines, etc. The general color scheme of the book is cream and brown, light tint blocks being used on all the pages. The frontispiece is an excellent reproduction of the painting "Fame," by Edith Prellwitz, and the cover is a portrait medallion in bright colors.

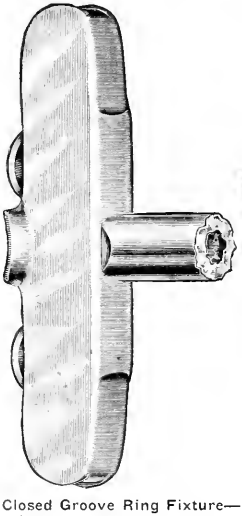
THE CLOSED GROOVE RING FIXTURE.

A new window curtain fixture especially adapted for semi-convertible cars has just been perfected by the Curtain Supply Company, Chicago. Illustrations are presented herewith showing cut-away views of this fixture. The new types are made with either front or drop pinch handles or without handles.

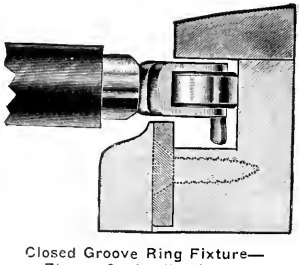
Figure 1 is a sectional view of a ring fixture with front pinch handles. This closed groove



Closed Groove Ring Fixture—Figure 1—Sectional View.



Closed Groove Ring Fixture—Figure 2—View Showing Flange.



Closed Groove Ring Fixture—Figure 3—Application of Steel Confining Strip.

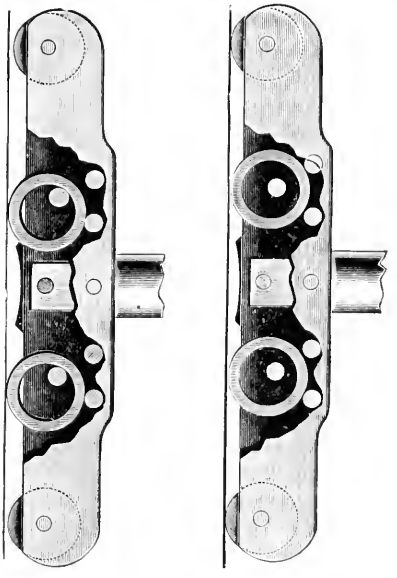
fixture combines the good features of the ring fixtures with several new and important features obtained by flanging a part of the tip and employing a metal confining strip, as illustrated in Figures 2 and 3. The new fixture is self-righting and the flange on the head in combination with the confining steel strip, as shown in Figure 3, prevents any possibility of escape from the grooves. An additional desirable feature is the peculiar form of the head and flange, which makes it impossible for the fixture to bind when in a canted or oblique position. This fixture can be operated with or without handles and is adjustable to any variation in window opening.

In Figure 4 the fixture is shown in a holding position, a section of the head having been cut away so that the two loosely mounted holding rings may be seen. Any upward pull of the roller causes the ring to rock or jam against the bottom of the grooves and thus holds the curtain in any desired position. Desirable features for which claims are made are: No jarring of the car can make the curtain creep upward, and the curtain way be moved up or down by grasping the fixture at any point along the bottom.

The non-holding position of the fixture is illustrated in Figure 5, which shows the rings out of contact with the grooved bottoms. When the curtain is pulled down the rings recede and the fixture then rests on the anti-friction rollers at either end of the shoes and can be moved freely. The mo-

ment the hand is removed from the curtain the upward pull of the roller is again exerted and the rings rock against the grooved bottoms, holding the fixture firmly in place.

The ring fixture as described requires a groove $\frac{5}{8}$ inch wide and $\frac{1}{2}$ inch deep under the confining strip, and this strip



Closed Groove Ring Fixture—Figures 4 and 5—Tips in Holding and Non-Holding Positions.

should be so placed that the opening is $\frac{3}{8}$ inch wide, the detail arrangement being shown in Figure 3.

THE LUFKIN RULE COMPANY.

The accompanying illustration shows the plant of the Lufkin Rule Company at Saginaw, Mich., to which extensive additions have recently been made. Since its establishment a quarter of a century ago, the company has experienced a phenomenal growth, and today its plant is the largest of its kind in existence.

The rapid rise of this company has been due chiefly to the superior quality of its products, which include steel and cloth measuring tapes, steel and wood rules and a number of other hardware specialties. While all of these are made with the same degree of care in order to maintain that excellence of

Plant of the Lufkin Rule Company, Saginaw, Mich.

quality which has given the company its world-wide reputation, it is through the manufacture of steel measuring tapes that the company is best known to engineers. In fact, the name "Lufkin" has come within the past few years to be linked almost inseparably with "measuring tapes."

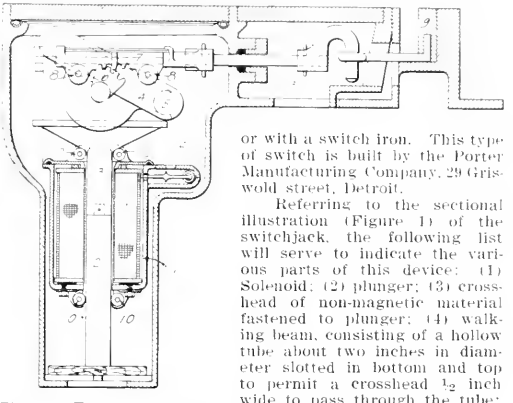
In addition to its factory at Saginaw, Mich., the company has in operation a branch at Windsor, Can. Offices are maintained in New York City and in London, Eng. From the London office the large export trade of the company is managed.

THE PORTER ELECTRIC TRACK SWITCH.

Wherever great numbers of cars are operated over special track work it becomes necessary either to place a switch tender at important street intersections during the rush hours or to install an automatic device through the agency of which the motorman on an approaching car can operate the facing switches. Various forms of automatic switch operators have been tried.

In general these are of two classes: (1) those carried on the platform of the car and (2) those installed in the street. The principal reason why that type of switch operator which comprises a mechanical arrangement carried on a car platform is not more generally used is because one such device must be purchased and installed for each end of a car. It is said that such mechanical devices also necessitate very slow running when operating over the switch or its trip.

The second class of automatic switch operators is that which includes electro-magnets or solenoids placed under the pavement to operate the switch points through some train of mechanical apparatus. In general these electric track switches require no special apparatus on the car and have shown themselves to be reliable. The accompanying illustrations will assist in the description of such a device, which not only successfully throws the switch as desired, but automatically locks it so that it will not jar across the jaws or otherwise be thrown except by the motorman, either from his car



Electric Track Switches—Fig. 1—Sectional View of Porter Switchjack.

or with a switch iron. This type of switch is built by the Porter Manufacturing Company, 29 Griswold street, Detroit.

Referring to the sectional illustration (Figure 1) of the switchjack, the following list will serve to indicate the various parts of this device: (1) Solenoid; (2) plunger; (3) crosshead of non-magnetic material fastened to plunger; (4) walking beam, consisting of a hollow tube about two inches in diameter slotted in bottom and top to permit a crosshead $\frac{1}{2}$ inch wide to pass through the tube; (5) iron ball loose in tube of walking beam; (6) sectional pinion secured on each side of walking beam; (7) carriage held in place by (8) four small wheels; (9) tongue of switch; (10) rollers preventing side pull of plunger; (11) case for solenoid, filled with insulating oil; (12) waterproof cast-iron case for mechanism; (13) extension of case provided with separate cover so that switch tongue can be connected to operating mechanism without removing cover of main waterproof case.

The mechanisms contained in the outside castings can easily be withdrawn a single piece at a time and can readily be assembled by a novice, as there are no bolts, screws or special tools required in assembling.

Operation.

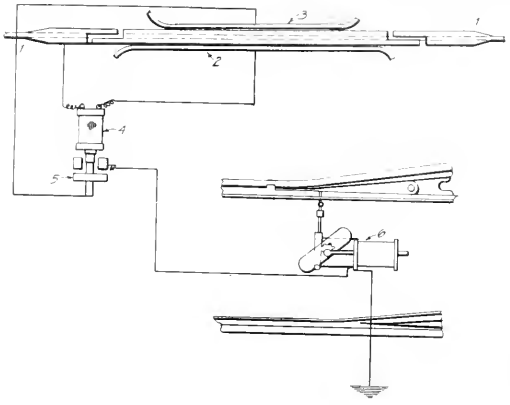
When an electric current is sent around the solenoid the plunger and crosshead are pulled up by magnetic attraction, the crosshead coming in contact with the iron ball in the lower part of the walking beam. The pinions fastened to the walking beam are turned through an angle and move the carriage. As soon as the electric current in the solenoid is broken the crosshead and plunger drop by their own weight to their lower position, at the same time releasing the iron ball, which immediately rolls down to the opposite end of the walking beam cylinder. The next time current is applied to the solenoid the same operation is repeated, except that the opposite end of the walking beam is pushed up and the switch tongue is therefore pushed in the opposite direction.

The duty of a motorman, if the switch tongue is set correctly, is simply to let his car drift over the section containing the switch control mechanism. If it is necessary to throw the switch tongue power should be applied to the car as it approaches the switch control mechanism.

Three different methods of wiring Porter switchjacks are used. The method to be used on any railway depends largely on local conditions. These methods are as follows:

(1) Solenoid connected in parallel with low-resistance shunt connected to a section of the trolley wire. (2) Solenoid connected in parallel with low-resistance shunt connected to an insulated section of the railway track. (3) Main solenoid connected from trolley to earth and operated by switch connected to an auxiliary solenoid, which is connected to a switch of the trolley wire.

Figure 2 shows the wiring necessary for operating the switchjack when the main solenoid is connected from the

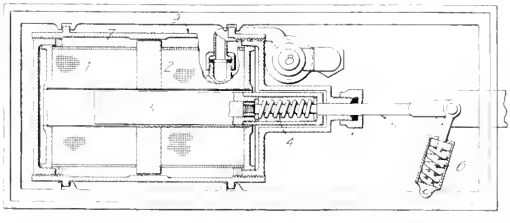


Electric Track Switches—Figure 2—Method of Wiring Switchjack.

trolley to earth by means of switch connected to an auxiliary solenoid.

(1) Is the trolley wire, (2) contact for auxiliary solenoid, (3) contact for main solenoid, (4) auxiliary solenoid, (5) switch operated by auxiliary solenoid, and (6) main solenoid.

The trolley bridge lowers the trolley wheel from the trolley wire and forces the car equipment to take current through the auxiliary solenoid. If the car takes current while the trolley is passing over the bridge this current passes through the auxiliary solenoid, 4, and raises the plunger which throws in switch, 5. This switch connects the main solenoid from the trolley line at contact, 3, to earth. The operation of the



Electric Track Switches—Figure 3—Porter Double Solenoid Switchjack.

switch point by means of the main solenoid is as earlier explained.

The trolley bridge or breaker weighs but 11 pounds and may readily be adjusted on any trolley without cutting the wire. It needs no span wire to hold it up.

Porter's Double Solenoid Switchjack.

Figure 3 shows double solenoid switchjack operator, designed for a pull of 150 pounds. Referring to the illustration (1) and (2) are solenoids, (3) plunger, (4) shock absorber spring, (5) rod connecting plunger with switch point, (6) locking device, (7) cast-iron case filled with insulating oil, (8) pocket for holding connecting wires, (9) cast-iron case for all the mechanism.

This electrical operator is designed to throw a switch in one or other direction every time a car approaches that switch. The wiring required for the double solenoid operator is similar in principle to that illustrated in Figure 2.

In actual service, if it is desired that the car should turn to the left, power is thrown on as the car approaches the trolley bridge. This current flows from the trolley wire through an auxiliary solenoid and contact to the trolley wheel and car. The auxiliary solenoid raises its plunger and connects the right side of the main solenoid from the trolley contact to earth, thus pulling over the switch point.

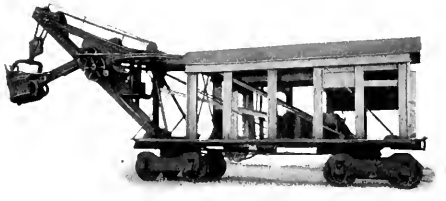
If it is desired that the car should turn to the right the power is turned off while the trolley wheel is passing across the bridge. The left side of the main solenoid is then connected from the trolley contact through the switch to earth, the plunger of the auxiliary solenoid not being raised. Thus the duty of a motorman is to turn his controller off if he wishes to turn to the right and to turn his controller on if he wishes to turn to the left.

The operation of the double solenoid is simple. The plunger is pulled in one or other direction accordingly as one or other of the solenoids is energized. The shock absorber is a spring which prevents the switch point from being thrown too violently. The locking device holds the switch point in position after the electric current is cut off of the solenoid.

ELECTRIC SHOVELS FOR BALLAST WORK.

Last summer the Chautauqua Traction Company, Jamestown, N. Y., purchased from the Vulcan Iron Works, Toledo, O., a "Giant Class F" electric shovel and installed it in a gravel pit for digging ballast. The shovel did excellent work up to a few months ago, when it was closed down for the winter. The following is a short description of the new shovel and a few observations as to its work.

The car body is 27 feet long by 7 feet 8 inches wide and is mounted on standard-gauge trucks. It is equipped with a 1½-yard dipper, which has a clear height of lift with door open of 12 feet. It will make a cut at the level of the rails of 26 feet. There are three separate motors, one for hoisting the dipper, one for swinging the crane and a motor on the crane for crowding the dipper into the bank. All motors are



Electrically Operated Shovel.

of the railway type, using direct current at 600 volts pressure and running 700 revolutions per minute. The main or hoisting motor is rated at 75 horsepower; the swing and crane motors are rated at 30 horsepower each.

With the shovel working in a cut 12 feet deep and operating at its full capacity, the hoisting motor drew about 80 amperes of current. At times the load would run up as high as 180 amperes, but this would be only momentary, and would only occur when the man on the crane would crowd the dipper into the bank or when some obstruction in the shape of boulders was met. The crowding or crane motor current averaged about 30 amperes, but when crowding the dipper into the bank with its full force, the load would run up as high as 80 amperes. The swinging motor load averaged between 30 and 40 amperes.

The material dug was a mixture of gravel, sticky clay and sand, but the motors were never overtaxed. The shovel averaged three complete dips and swings per minute with the dipper carrying 1½ cubic yards of material each time. Power was taken directly from the trolley wires.

This type of shovel is winning favor for all work where electric power is available. The design has long since passed the experimental stage, and these shovels are said to be the equal in every way of a steam shovel. Important economy is gained because no fireman is needed and no expense for hauling coal or water is required.

Cement Production.

Returns received by the United States geological survey from 87 plants, representing over 95 per cent of the cement production of the United States, indicate that the total output in 1907 was 48,000,000 barrels. This compares with an output of 46,463,424 barrels in 1906 and of 35,246,812 barrels in 1905.

Can establish and maintain complete system of accounts. Street and interurban railway properties a specialty. Address "No. 554," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Positon as chief engineer and machinist wanted. Will go to responsible company on trial. Have had 25 years' practical experience. Address "No. 563," care of Electric Railway Review, Chicago.

Position as auditor wanted by a young man of experience in street railway and electric light accounting. Best of references as to character and ability. Address "No. 545," care Electric Railway Review, Chicago.

Position as chief clerk or auditor by young single man with seven years' experience electric railway work. Good knowledge of operating departments; exceptional references. Address "No. 559," care of Electric Railway Review, Chicago.

Expert armature winder on all types of G.E. and Westinghouse motors is open for a position. Live, up-to-date man, capable of handling men. Excellent habits. A-1 references. Address "No. 552," care of Electric Railway Review, Chicago.

Master mechanic of undeniable ability and experience is at liberty to accept reasonable offer. Has had 15 years' experience in both steam and electric service. Has exceptional ability in equipping new rolling stock and handling shops and men on economical basis. Address "No. 560," care of Electric Railway Review, Chicago.

Experienced master mechanic desires position. Has thorough knowledge of high-speed electric railway equipment, on third rail or trolley. Is good executive, tactful and able to organize work of departments. Best of references furnished. Will consider position with high-speed interurban or city railway. Address "No. 550," care Electric Railway Review, Chicago.

Position by draftsman; have had nine years' experience in electric railway work, instrument work, mechanical and electrical drafting. Experience: assistant to master mechanic and inspector of car construction, equipment and maintenance; track work and buildings. Also familiar with operation. Thoroughly reliable. Address "No. 549," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Wanted — Electrical salesman who is selling to street railways to take important side line. J. W. Morrison, 29 Griswold St., Detroit, Mich.

Park superintendent wanted. State experience and salary wanted; also give references. Address "No. 561," care of Electric Railway Review, Chicago.

Technical men. Positions open in all departments. Write today if you will consider better position, change of location. Twelve offices. Service confidential. HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

BUSINESS OPPORTUNITIES.

Exclusive sales agency wanted for Chicago and west for several street railway specialties. Appliances for cars only. Address "No. 556," care of Electric Railway Review, Chicago.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Don't throw away your old batteries. We have a preparation which will positively renew old dry batteries at the cost of two cents each. Trial package and electrical catalogue 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

Experienced salesmen, opening office in Washington, D. C., desire to make arrangements to represent manufacturers of standard specialties and supplies for electric railways and contractors. Southern territory. Address "No. 562," care of Electric Railway Review, Chicago.

BOOKS AND PUBLICATIONS.

Ask us about any book on electric railway and allied subjects. We publish some and sell all that are in print. The Wilson Company, 160 Harrison Street, Chicago.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

If interested in any phase of steam transportation, you will find every development covered fully and accurately in The Railway Age. It is the leader and acknowledged authority in this field. Ask for free sample copies. The Railway Age, 160 Harrison Street, Chicago.

A copy of "The Motorman and His Duties," the standard handbook on the theory and practice of electric car operation, is worth many times its cost to every man interested in the subject. Send for 16-page pamphlet of sample pages. The Wilson Company, 160 Harrison Street, Chicago.

If You Have a Position for a High Grade Man

you can quickly secure his services in one of two ways

- by answering "Positions Wanted" advertisements on this page, or
- by advertising on this page under the heading, "Positions Open"

Branch Line Railroad Electrification.

The inauguration of electric service on certain branch lines of the New York New Haven & Hartford Railroad in Connecticut illustrates an interesting phase of recent steam road electrification. It is noteworthy that this branch line work is being pushed forward with all feasible celerity. The class of service to be maintained on these branches differs, of course, considerably from the electric locomotive service that was inaugurated last year on the main line between New York and Stamford. It is practically an interurban service on steam road tracks and dispenses with the costly scheme of running infrequent and cumbersome steam trains for light traffic and short distances. Electric interurban cars are operated both in the city streets of Hartford, Berlin and Meriden and on the regular railroad trackage of the company in cross country running. Thus it is clearly a great advantage to escape the limitations of the highway in operating between these populous centers. The New Haven system, as is well known, occupies a territory that is very densely populated, and its earnings from freight and passenger service are nearly equal. Its mileage is very largely distributed in a network of branch lines, and, with the important main line electrification projects now under consideration or pending, and the broad-minded policy of branch line electrification set in motion, will be sure to establish a precedent for other systems. The old idea was that the main lines of the steam roads carrying a very heavy traffic would first be electrified, but the success of the lighter branch line work will do much to hasten the complete electrification of all systems where frequent service is a necessity.

Subways in New York.

The prospects for additional subway construction in New York City have been greatly complicated within the past few days by the announcement of Comptroller Metz that the available borrowing capacity of the city is not sufficient to build any subways at the present time and probably will not be for the next two years. There are now 19 of what Mr. Metz calls "blue-pencil subways" on the maps of the public service commission and the approval of the board of estimate is sought for two more. The city is clamoring for additional transit facilities and actually requires more subways to handle the present traffic, not to mention providing for future development. In this connection an anomalous condition is presented in the status of the so-called Belmont or Steinway tunnel owned by the Interborough Rapid Transit Company. This tunnel, which extends under the East river at Forty-second street and is an important link between the trolley systems of Long Island and the entire transportation system of Manhattan, was practically completed several months ago and, according to the officers of the company, could be placed in operation in connection with the subway within 60 days. The tunnel, however, remains idle because of a cloud on the franchise, which is being contested in the courts at the instance of the city. Not being in a position to operate, the Interborough company has offered to sell the tunnel to the city for the cost of construction, to be operated jointly by the city and the New York & Queens County Railway. Because of a dispute as to jurisdiction neither the city nor the public service commission has taken any action on the proposal and it is doubtful if the city is in a position to finance the purchase at the present time. It would seem that the only available solution would be for the city to withdraw its suits and allow the company to apply for a new franchise. The general situation would be greatly relieved by the passage of a bill now pending before the legislature to permit the public service commission to grant franchises for subway construction to private companies.

Do Not Encourage Walking.

It is not an absolutely new experience for managers of electric railway systems to be forced by the decrease in revenues to curtail, as far as consistent, all expenditures. The advisability of providing under such conditions an available supply of money as large or in proportion to the surplus kept in normal times cannot be questioned. One of the best examples of this far-sightedness comes from the management of an elevated road in the central west which by reducing the dividends 1 per cent for the coming year will avoid the necessity of issuing bonds or certificates to meet depreciation or the purchase of new equipment. But a strikingly opposite plan has been put into effect on an eastern city system and with a radical difference in results. It was thought that by reducing the car mileage a saving equal to the loss in daily revenues could be maintained and the one balance the other. Therefore a trial was made. The result after several weeks' experimenting is a decided loss to the company. People having short distances to go or those having longer distances that could be reached in a short time have found that the time consumed in waiting for a car and then getting to their destination would be equal to or nearly as great as the time necessary to walk the entire distance. A street car system should not educate those upon whom it is dependent for an existence to employ some different means of locomotion. Otherwise the result will be bad. A majority of those who are thus educated to walk, partly through inadequate transportation facilities, may continue in this practice. If this proves true the loss is permanent. In times when plans are proposed to meet temporary conditions only it would be well to make certain that the operation of such plans does not overlap and carry ill effects to a season that should bring plentiful earnings.

A Railway Blue Book.

We have been favored with a copy of the "blue book" of the Ft. Wayne & Wabash Valley Traction Company. This book is so unique in character and fills such a peculiar niche in electric railway operation that a fitting announcement of its contents is warranted here. The blue book is comprised of a long strip of blue print paper folded into a booklet of 38 pages. As explained by its donor, "This book is issued by the maintenance of way department of the Ft. Wayne & Wabash Valley Traction Company. It is printed every little while and not oftener than once a year and distributed for our convenience and the admiration of our friends." The first cover of the book exhibits views along the "Wabash valley route." The second page is a directory

of the executive and operating staff of the railway. On the next page are tables showing track elevation for various degrees of curvature and practical leads used in placing switches and frogs. Then come six photographic views along the route showing the attractiveness of the roadway and the territory served. A general map including the Wabash valley route and other electric roads in northern Indiana is presented. The major portion of this interesting booklet is a very complete route map, including the main lines and various local divisions. The information exhibited on this map should make it of especial value to any and all of the operating staff. There are exhibited as follows: Location of each town and county line intersected; each highway, railway, waterway and farm road crossed; each stop and siding; the owner's name and the boundary of each farm crossed; the location of substations; the rail sections of which the track is composed; the population of the important cities; the names of the various track foremen and the exact limits of their sections; the location of the various power stations, their capacities, the arrangement of alternating and direct current feeding and distribution wires, including their sizes, and the arrangement of the trolley and telephone wires. The map presenting all this information for the entire Ft. Wayne & Wabash Valley route is 145 inches long and very carefully made. On inspection one can readily see how valuable this blue book must be as a handy means of reference.

HIGH-VOLTAGE DIRECT-CURRENT TRANSMISSION.

Preliminary engineering work is being carried on with a view to designing a transmission system which may be used to carry electrical power from a hydraulic generating station at Victoria Falls to the mining districts 700 miles away in South Africa. Both European and American engineers are engaged in this work. The opinion of the European engineers is that for so great a transmission distance it will be possible to operate only with direct current at what are now considered excessively high voltages. The American engineer also engaged in this work, is Ralph D. Mershon. He holds the opinion that the transmission of a large amount of power over so great an intervening distance will be possible only by utilizing alternating current.

The opinions of these engineers is indicative of the substance of frequent discussions which recently have taken place before engineering bodies in Europe. Briefly, the point at issue is whether or not high-voltage direct currents are feasible for long-distance power transmission. With the characteristics of alternating-current transmission lines in mind, it may be interesting to outline briefly the so-called "Thury" direct-current system of high-tension transmission.

In contrast with our low-tension direct-current distribution networks with their constant potential and varying current, the Thury system employs a constant current and a variable potential obtained by varying the generator speed. To obtain the high voltages, generators wound to deliver constant current are electrically connected in series so that the difference of potential across the entire series is sufficiently high for the transmission purposes. Each of the direct-current generators is insulated from the ground and from the prime mover which drives it, the latter insulation being effected by means of a flexible shaft coupling composed of silk. As the machines are insulated from the ground, the commutator on any machine is subjected only to the difference of potential between its own brushes, while the difference of potential between the terminals of the end machines may be as high as 80,000 volts.

The power generated is controlled in amount by regulation of the voltage. This regulation is effected by varying the generator speed through the medium of an electrically controlled governor, which decreases the speed when the load decreases and vice versa.

A single circuit only is required for the transmission of the power. At the receiving end motors are arranged as at the generator end. These motors are wound for constant speed, the speed being kept uniform by means of a centrifugal governor which shifts the brushes as the load varies. Thus, as the load decreases the speed tends to increase and the governor then moves the brushes toward the neutral point. With the brushes moved toward the neutral point, the current tends to decrease and this in turn causes the governors in the power house at the other end of the line to decrease the speed of the generators until the required voltage for the load on the motors is obtained.

In Europe a transmission system of this character is said to be operating satisfactorily. The Thury system as yet is untried in America. This may be accounted for by reason of the fact that so many important advancements have of late been made in the art of alternating-current power transmission.

CAR ILLUMINATION WITH ARC LAMPS.

A brightly illuminated passenger car is a good advertisement. Plentiful illumination in cars is appreciated by passengers and advantageously noted by the non-passenger part of the public. These fundamental facts are becoming more generally recognized and various types of lamps in numerous combinations are used to obtain the desired effect. For illuminating the interiors of large interurban cars, the arc lamp is a medium which is worthy of careful consideration.

The enclosed arc lamp is used for general illumination on the interurban cars of the Pacific Electric Railway, Los Angeles Interurban Railway, San Francisco, Oakland and San Jose Railway, and the Northern Electric Company, all in California; and among the eastern roads using this method of illumination is the recently built Philadelphia & Western Railway.

Cars illuminated with arc lamps present a more brilliant effect than cars lighted with incandescent lamps. The arc lamp, of course, requires more current than the number of incandescent lamps which would usually be considered necessary to do the same work; but on the other hand the arc lamps give the interior of a car a much more attractive appearance. Severe variations in voltage which cannot well be avoided on long interurban lines, do not as seriously affect the illuminating power of arc lamps as they do the candlepower of incandescent lamps. This feature of providing a passenger with a sufficient amount of light to enable him to read uninterruptedly during his entire journey, without any particular inconvenience whether the train be standing or starting, is appreciated where arc lights are used.

The cars of some roads are lighted with only one interior arc light and when this light can be operated in series with the arc headlight very economical results are obtained. The large interurban cars of the Pacific Electric and the Los Angeles Railway companies are wired for two interior arc lights connected in parallel, and this circuit in turn is in series with the arc headlight. When these cars were first put into service, they were wired with the two interior lights in series with the headlight and in this way the headlight received but the three amperes of current which also passed through the two interior lights in series with it. On account of the high speed at which some of the cars operated on the longer lines, it was found that the headlights did not illuminate the track far enough in advance of the car; therefore, to provide for a more powerful illumination with these same headlights, they were rearranged so that they would operate with six amperes of current rather than three. To furnish this amount of current it was found that a most economical way was afforded by connecting the two interior arc lights in parallel with lamps burning at the rate of three amperes and the pair in series with the 6-ampère headlights. Thus, the benefit of

the additional current required in the headlight for intense illumination is obtained while the cars are lighted in exactly the same way, and yet it is not necessary to waste current in a resistance which otherwise would have been required to limit the headlight current to six amperes.

The life of the carbons in the enclosed arc lamps suitable for interurban car illumination is about 50 hours. This is sufficient for several days' service, but nevertheless the lamps will operate more effectively when trimmed each day. Inasmuch as the jolting of the car puts an arc lamp to a rather severe test, it is only fair that it should have daily inspection. In comparison with its competitor, the electric bulb, the arc lamp gives a plentiful and uniform illumination throughout wide variations in voltage, while the incandescent lamp gives a softer, less powerful illumination varying with excessive changes in voltage.

ANNUAL REPORTS.

Winnipeg Electric Railway.

Gross earnings of the Winnipeg Electric Railway in 1907 increased 21.62 per cent over 1906. As operating expenses increased only 10.53 per cent, the net earnings from operation showed a gain of 30.75 per cent. Earnings for the last two years compare as follows:

	1907.	1906.	Increase.
Gross earnings	$1,722,407	$1,416,305	$306,102
Operating expenses	775,731	701,964	73,767
Net earnings	$ 946,676	$ 714,341	$232,335
Fixed charges	386,667	251,037	135,630
Divisible income	$ 560,009	$ 463,304	$ 96,705
Dividends	373,137	248,669	124,468
Surplus	$ 186,872	$ 214,635	*$27,763
Operating expenses, per cent of gross earnings	45.05	49.56	51.42

*Decrease.

William Mackenzie, the president, gives a list of additions made during the year, which include 40 additional double-truck cars, of which 20 were constructed at the shops of the company and 20 by the Ottawa Car Company; 19.5 miles of track; equipment of all cars with air brakes and heaters for motormen's vestibules; 1,588 new poles and 340,088 pounds of wire, used in the extension of electric lighting and power lines; 48,007 feet of new gas mains required in extensions; 838 new gas services; and an addition to the Ft. Rouge car house, with a capacity of 50 cars. The "cost of property" on the balance sheet as of December 31, 1907, is $12,001,911, as compared with $10,654,759 at the end of the previous year. The amount of outstanding bonds was not changed in the year from $5,400,000. The capital stock outstanding was $5,320,950, an increase of $945,750. The figures of passengers carried compare as follows:

	1907.	1906.	1905.
Passengers carried	20,846,317	17,229,554	13,081,249
Transfer passengers	5,954,067	3,109,094	1,682,685

American Association Committees on "Classification" Appointed.

The following committees on "Classification" have been appointed to consider the tentative classifications of the interstate commerce commission:

American Street and Interurban Railway Association—Gen. George H. Harries, chairman, Washington, D. C.; C. Loomis Allen, Utica, N. Y.; Frank R. Ford, New York, N. Y.; Arthur W. Brady, Anderson, Ind.; W. B. McKinley, Champaign, Ill.

American Street and Interurban Railway Accountants' Association—W. F. Ham, chairman, Washington, D. C.; H. L. Wilson, Boston, Mass.; Frank R. Henry, St. Louis, Mo.; William G. McDole, Cleveland, O.; C. N. Duffy, Milwaukee, Wis.

REPORT ON CAUSE OF THE QUEBEC BRIDGE FAILURE.

The report of the royal commission, consisting of Henry Holgate of Montreal, John G. Kerry of Campbellford and Prof. J. Galbraith of Toronto, appointed to investigate the cause of the failure of the Quebec bridge, which collapsed on August 29, 1907, was submitted to the house of commons of the Canadian parliament on March 9.

The findings of the commission, which were unanimous, are as follows:

(a) The collapse of the Quebec bridge resulted from the failure of the lower chords in the anchor arm near the main pier. The failure of these chords was due to their defective design.

(b) The stresses that caused the failure were not due to abnormal weather conditions or accident, but were such as might be expected in the regular course of erection.

(c) The design of the chords that failed was made by P. L. Szlapka, the designing engineer of the Phoenix Bridge Company.

(d) This design was examined and officially approved by Theodore Cooper, consulting engineer of the Quebec Bridge & Railway Company.

(e) The failure cannot be attributed directly to any cause other than errors in judgment on the part of those two engineers.

(f) These errors of judgment cannot be attributed either to lack of common professional knowledge, to neglect of duty or to a desire to economize. The ability of the two engineers was tried in one of the most difficult professional problems of the day and proved to be insufficient for the task.

(g) We do not consider that the specifications for the work were satisfactory or sufficient, the unit stresses in particular being higher than any established by past practice. The specifications were accepted without protest by all interested.

(h) A grave error was made in assuming the dead load for the calculations at too low a value and not afterward revising this assumption. This error was of sufficient magnitude to have required the condemnation of the bridge, even if the details of the lower chords had been of sufficient strength, because, if the bridge had been completed as designed, the actual stresses would have been considerably greater than those permitted by the specifications.

This erroneous assumption was made by Mr. Szlapka and accepted by Mr. Cooper and tended to hasten the disaster.

(i) We do not believe that the fall of the bridge could have been prevented by any action that might have been taken after August 27, 1907. Any effort to brace or take down the structure would have been impracticable, owing to the manifest risk of human life involved.

(j) The loss of life in August, 1907, might have been prevented by the exercise of better judgment on the part of those in responsible charge of the work for the Quebec Bridge & Railway Company and for the Phoenix Bridge Company.

(k) The failure on the part of the Quebec Bridge & Railway Company to appoint an experienced bridge engineer was a mistake. This resulted in a loose and inefficient supervision of all parts of the work on the part of the Quebec Bridge & Railway Company.

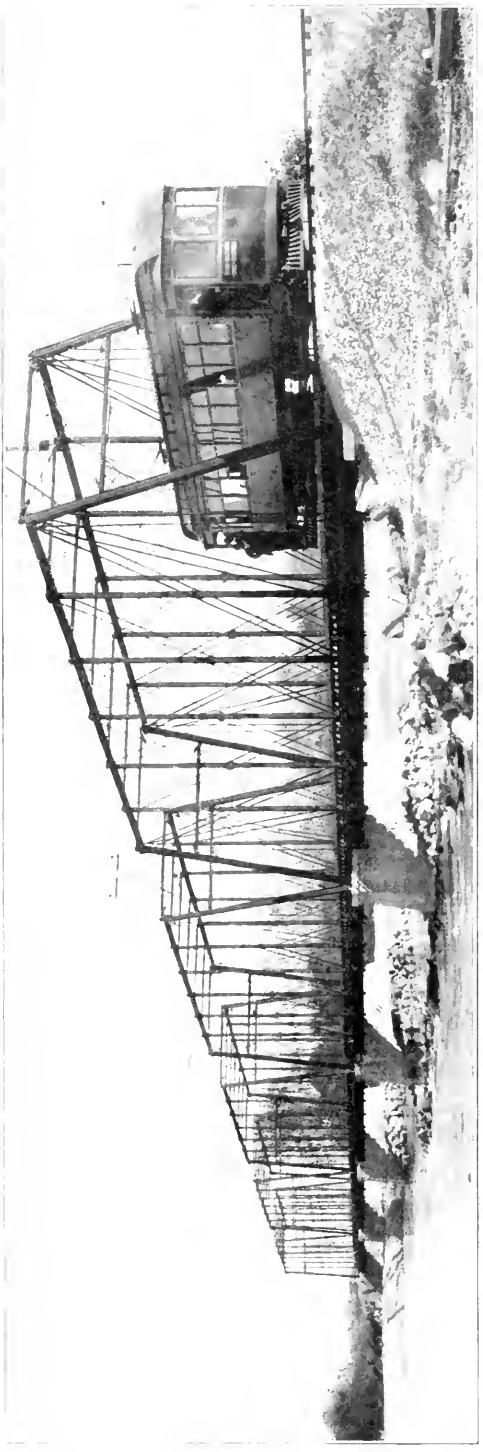
(l) The work done by the Phoenix Bridge Company in making the detail drawings and in planning and carrying out the erection, and by the Phoenix Iron Company in fabricating the material was good and the steel used was of good quality. The serious defects were fundamental errors in design.

(m) No one connected with the general designing fully appreciated the magnitude of the work nor the insufficiency of the data upon which they were depending. The special experimental studies and investigations that were required to confirm the judgment of the designers were not made.

(n) The professional knowledge of the present day concerning the action of steel columns under load is not sufficient to enable engineers to economically design such structures as the Quebec bridge. A bridge of the adopted span that will unquestionably be safe can be built, but in the present state of professional knowledge a considerably larger amount of metal would have to be used than might be required if our knowledge were more exact.

(o) The professional record of Mr. Cooper was such that his selection for the authoritative position that he occupied was warranted, and the complete confidence that was placed in his judgment by the officials of the dominion government and the Phoenix Bridge Company was deserved.

Recent floods in northern Ohio and Indiana have seriously interfered with service on the interurban lines.



Boise & Interurban Railway—Steel Truss Bridge, 550 Feet Long, over Boise River, Showing Interurban Passenger Car.

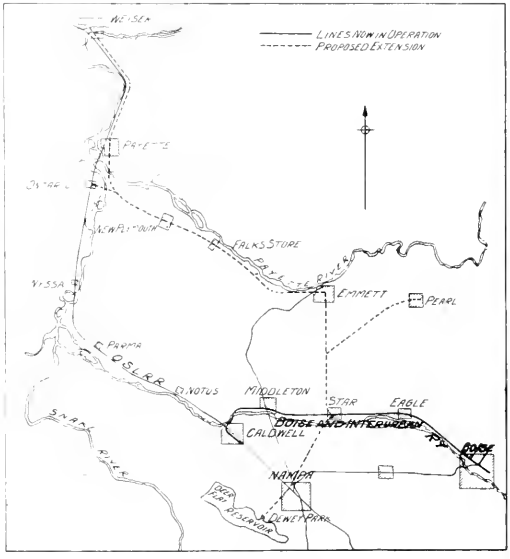
THE BOISE & INTERURBAN RAILWAY.

The Boise & Interurban Railway of Boise, Idaho, was opened for traffic on August 8, 1907, between Boise and Caldwell, Idaho, a distance of about 29 miles. Boise, the capital, as well as the financial and social center of the state, has a population of 25,000. Caldwell, the other terminus, is a town of 5,000 inhabitants, located on the Oregon Short Line Railroad.

As will be seen from the accompanying map, the line runs parallel with the Boise river, through the thriving villages of Eagle, Star and Middleton, and through a territory hitherto without railroad connections. On November 16, 1907, the company also began operating a city loop of 3½ miles in Boise and both lines have since justified the expectations of the owners in the passenger traffic returns.

Track and Roadway.

The main line is 28.6 miles long, with about four miles of switch and side track, all located on private fenced right



Boise & Interurban Railway—Map of Operating Line and Proposed Extensions.

of way, except where the road passes through the town or city streets. The track construction is of a substantial character, consisting of 60 and 72 pounds T-rails laid on standard ties and fully ballasted. In paved streets 7-inch T-rails are used. The rails are bonded with Ohio Brass Company soldered bonds through open country and with American Steel & Wire Company twin terminal cable bonds in the city, all of a capacity equal to No. 0000 copper wire.

A 550-foot 5-span through truss steel bridge, with concrete piers and abutments, as shown in one of the illustrations, has been built over the Boise river near Boise. Plate girder construction has been used for short spans.

Overhead Construction.

In the city the overhead construction is span-supported, with No. 0000 trolley wire. On the interurban line a double No. 0000 trolley wire is supported by 9-foot brackets, made of 2-inch tubing. A single line of 60-foot cedar poles carries the bracket construction, the high-tension transmission wires and a telephone line. The transmission line is 60 miles long

and is composed of No. 3 aluminum wires. The material for the overhead construction was furnished by the Ohio Brass Company. Miller No. 3 anchors and wooden slugs were used for fastening the guy wires.

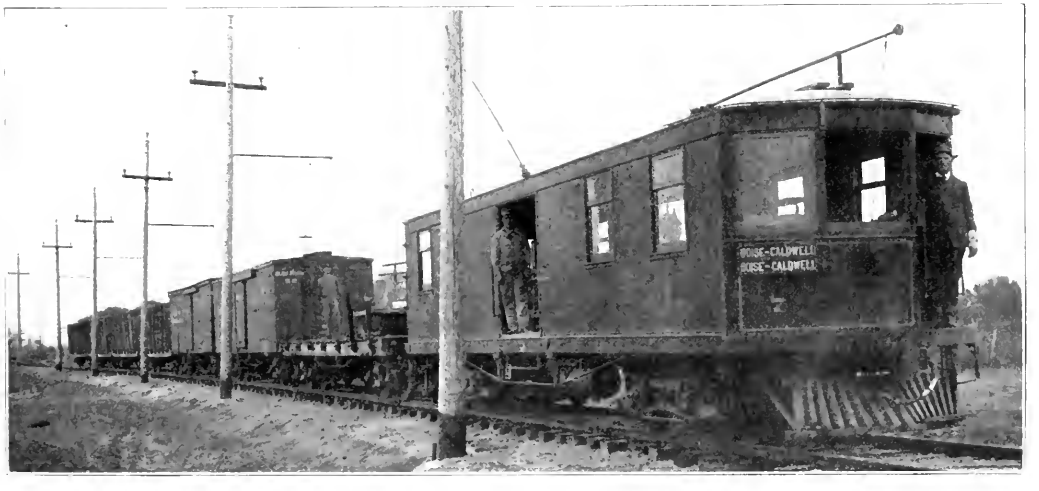
Power.

Power is obtained from a hydro-electric plant on the Snake river at Swan Falls, Idaho, owned by the Trade Dollar Consolidated Mining Company, which has large interests in the Boise & Interurban Railway Company. The power house building, which is illustrated herewith, is of reinforced concrete construction throughout, including roofs, floors, walls and generator foundations. The spillway of the dam in the Snake river is 459 feet wide and a head of 19 feet is obtained.

The plant has an electrical generating capacity of 2,300 kilowatts. The original plant of the mining company contained four 72-inch vertical water turbines belted to three 300-kilowatt Westinghouse generators. Last year the capacity of the plant was increased in order to furnish power for the railway by the installation of two additional 700-kilowatt generators, each direct-connected to two 66-inch vertical water turbines. The equipment of the plant includes a 10-ton traveling crane, oil-filled water-cooled transformers stepping the generator pressure up to 44,000 volts, static interruptors, oil switches, lightning arresters, etc. The current is carried over a 60-mile transmission line to two substations, where it is converted to direct current at 600 volts for operation.

The substation buildings, one of which is illustrated, are of white brick with concrete roofs, carried on steel girders and are of fireproof construction. The equipment of each substation consists of one 300-kilowatt 600-volt 60-cycle rotary converter, operating at 720 revolutions per minute, three 100-kilowatt oil-insulated, self-cooling transformers, with primary coils wound for 22,000 and 44,000 volts and secondary coils wound for 367 volts; one 50-ampere 44,000-volt oil switch and circuit-breaker, three 44,000-volt oil-insulated choke coils, three sets of lightning arresters, and one 4-panel switchboard, all furnished by the Westinghouse Electric & Manufacturing Company.

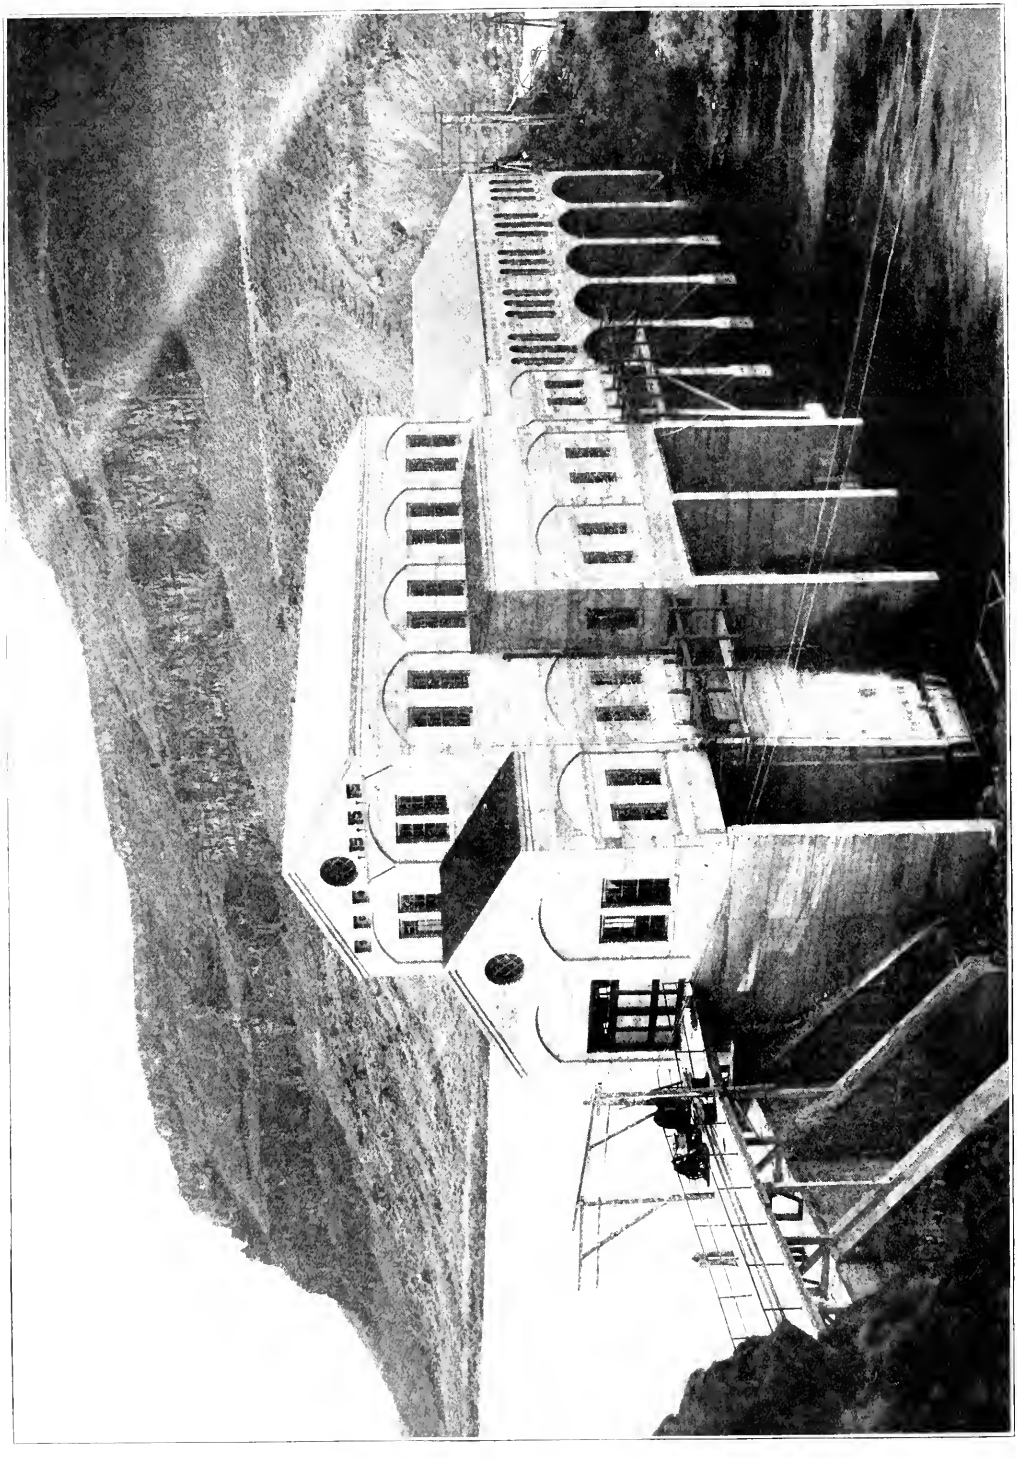
Boise & Interurban Railway—Car House and Repair Shop Building, with Substation in the Rear.



Boise & Interurban Railway—Express Motor Car Hauling Train of Seven Freight Cars.

Rolling Stock.

The rolling stock equipment consists of seven interurban cars built by the American Car Company of St. Louis and four city cars built by the St. Louis Car Company, besides a number of box and flat cars. Two of the interurban cars are of the

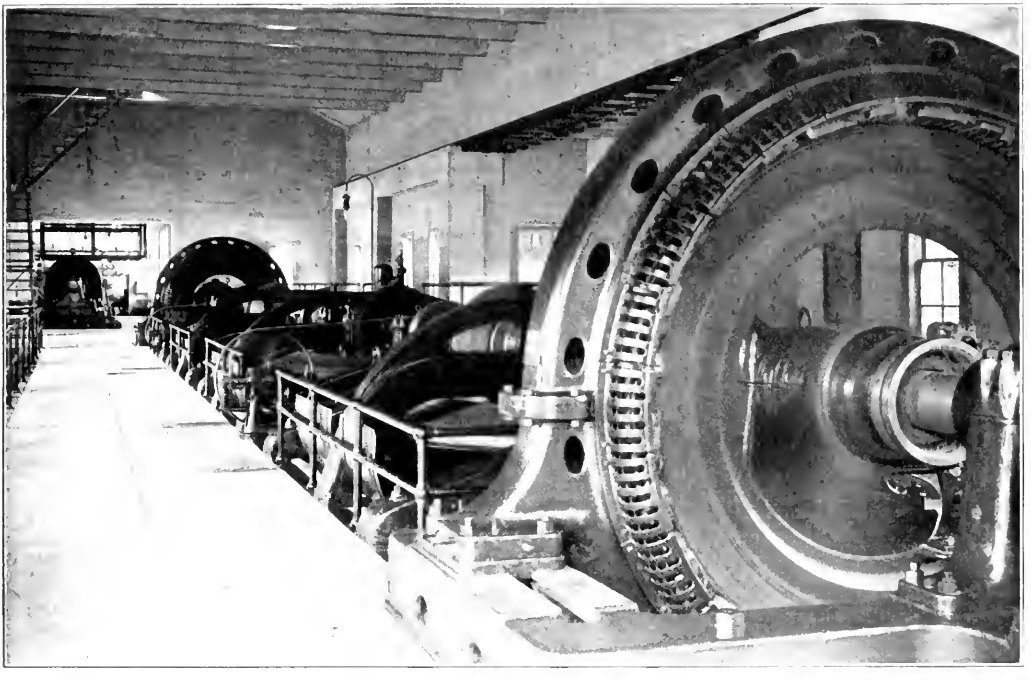


Boise & Interurban Railway—Hydro-Electric Power House on the Snake River at Swan Falls.

passenger and baggage type. Four are Brill semi-convertible passenger cars 32 feet long over corner posts and 43 feet 6 inches over bumpers and 8 feet 6 inches wide over sills, seating 41 passengers. They are equipped with Brill No. 27 E 1 double trucks with a 6-foot 6-inch wheel base, four 50-horsepower motors geared to a maximum speed of 46 miles per hour and type K 28 F controllers. There is also one express car of the same general dimensions as the passenger cars equipped with Brill No. 27-G1 trucks with a 6-foot 6-inch wheel base and four 60-horsepower motors geared to 20 miles per hour. The express car has four windows on each side and sliding doors at the center and ends of the car.

The city cars are 28 feet over corner posts and 41 feet over bumpers, and are equipped with St. Louis Car Company's No. 47 double trucks and K 28 B controllers.

The car house and repair shop building is located on the main line 4½ miles from Boise. It is 55 by 150 feet in size and has a capacity of 12 cars. This building, which is illustrated, is of white brick, like the substations, with a concrete roof carried on steel trusses, and a concrete floor. Each track has a concrete repair pit and convenient repair facilities.



Boise & Interurban Railway—View of Interior of Power House, Showing Two 700-Kilowatt Generators Geared to Hydraulic Turbines.

Traffic.

The road has terminal connections at Boise and at Caldwell with the Oregon Short Line Railroad, with which it has a traffic interchange agreement. It also has a traffic agreement and a track connection at Middletown with the Idaho Northern Railroad. These steam road connections and the policy of the company to develop all the business possible in its territory have led to a large and profitable freight traffic. Until the advent of this line the country traversed was isolated, and, although rich in soil and in natural resources, its productiveness has been somewhat handicapped by the lack of a proper outlet, consequently, in order to develop business rates have been placed at such a figure that no farmer or country merchant along the road can afford to drive to town for supplies. This policy has resulted in giving the road all the traffic to be had and it has handled many cars of sugar beets, fruit and farm produce, with fuel and merchandise for return traffic. Since the road began operating the population in the territory served has been greatly increased, large tracts of land have been subdivided into 5 and 10 acre farms, new residences are being built and a new activity is evident.

On the interurban line a 75-minute schedule is maintained with trains every 75 minutes from each terminal. The running time will soon be reduced to one hour or less. The rate of fare is about 2.6 cents per mile for 1-way tickets and 2.1 cents per mile for round-trip tickets. Mileage books and trip commutation books are also issued.

Pierce park, 4½ miles from Boise, 182 acres in extent, is now being provided with the attractions of a first-class amusement park, including a lagoon with electric launches and rowboats, baseball, recreation and picnic grounds and grounds for private gatherings, including a Chautauqua society.

The road has already outgrown the office quarters provided for it in the beginning and it is proposed to build this year a substantial and commodious office building on a choice corner, 100 by 122 feet, that has been purchased in the heart of Boise, which will serve the combined purposes of office rooms for the officers of the company, ticket offices and waiting rooms, and express and freight offices. The company has also purchased a choice corner in the center of Caldwell, upon which to erect a building adequate to its needs in that town.

An extension to Nampa is proposed and several other extensions are contemplated, to be made as soon as conditions warrant.

The officers of the company are: President, W. E. Pierce,

Boise, Idaho; vice-president, Julian Kennedy, Pittsburg, Pa.; secretary, T. B. McKaig, Pittsburg, Pa.; treasurer, A. C. Thompson, Pittsburg, Pa.; general manager, H. E. Dalton, Boise, Idaho.

The preliminary work was carried out by W. E. Pierce, president, assisted by F. P. King and C. J. Franklin, engineers, of Boise. F. H. Knox of Pittsburg was chief engineer in charge of construction. The Colonial Trust Company of Pittsburg was fiscal agent. The company has a capital stock of $5,000,000.

NEW YORK CITY RAILWAY RECEIVERS WANT $3,500,000 FOR IMPROVEMENTS.

The receivers for the New York City Railway filed in the United States circuit court, New York, on March 7, a petition for authority to issue $3,500,000 of receivers' certificates. Exclusive of the amount required to rebuild the car house at Ninety-sixth and Ninety-seventh streets, which was destroyed by fire on February 29, and to substitute new cars for those destroyed in the fire—this amount being estimated at $1,000,000 at least—the receivers state that they need the following sums:

For reconstruction of rolling stock	$ 900,000
Rehabilitation of tracks, paving, etc.	400,000
Payment for transformation of First avenue line between Fifty-ninth street and One Hundred and Twenty-fifth street from horse road to underground trolley	277,305
Completion of car house and repair shops at One Hundred and Forty-sixth street and Lenox avenue, in excess of insurance from fire of April, 1907	174,463
New cars to replace those of the Central Crosstown line destroyed by fire and in excess of insurance due	330,440
Installation of sprinkler systems, to insure sufficient and adequate insurance of property	507,279
Total	$2,589,487

The receivers have also filed a complaint in a suit against the Metropolitan Securities Company to recover $4,964,000, alleged to be the balance due of $8,000,000 to which the receivers say the New York City Railway was entitled by a contract with the Securities company. An agreement was entered into on May 22, 1907, by which the New York City Railway was to lend to the Metropolitan Street Railway $8,000,000 for various expenditures made necessary by changes in motive power, etc. This sum was to be furnished on reasonable notice at any time before January 1, 1909. By the agreement the Metropolitan Street Railway was to issue $8,000,000 of 3-year 5 per cent improvement notes, secured by notes of its subsidiary companies, and to turn these over to the Metropolitan Securities Company, and the Securities company was to furnish the New York City Railway such sums as it might need to carry out the contract. The complaint says that $3,036,000 was furnished and suit is now started for the balance, with interest from September 24, 1907, and costs.

The petition for authority to issue receivers' certificates states that the failure of the Metropolitan Securities Company to pay the money under this contract partly makes necessary the petition. The receivers point out that if they win that suit they will be able to retire some of the certificates.

The property of the railway was examined by a representative of the public service commission. The commission ordered many cars reconstructed and other improvements made. The petition states on this subject:

Incidentally it may be suggested that if for the last few years the New York City Railway had made the expenditures necessary to keep the rolling stock (also the track and subsurface hereinafter referred to) in first-class condition it probably would not have been able to pay to the Metropolitan Street Railway its stipulated rental, which was distributed among its stockholders. The total amount required to transform the rolling stock from what it was when we received it in September to what it will be when reconstructed in full compliance with the requirements of the public service commission by the beginning of next summer is upon a very conservative estimate $900,000.

In addition to the extra expenditures required all over the city in order to bring the track surface structure up to a proper operating condition certain portions of the tracks and subsurface of the system must be entirely rehabilitated prior to June 30, 1908.

The maintenance of the pavement, which by statute is obligatory upon the company, not only within and between the tracks, but for a distance of two feet from the outer rail of the track, becomes difficult when the track is not in proper condition. At the present time the city is largely paved with some form of asphalt, and this pavement is peculiarly susceptible to injury through the vibration of loose rails and the pounding of defective joints. As soon as the pavement begins to break, due to such movements in the track structure, the heavy traffic to which it is subjected on the main thoroughfares on Manhattan island aggravates the condition and produces a very rapid disintegration of the wearing surface, so that it is but a very short time before serious holes in the pavement are made, necessitating a particularly heavy expense for maintenance.

The cost of completing the burned One Hundred and Forty-sixth Street shops will be $665,000. Money received or still due from insurance companies is $490,537, leaving a loss of $174,463.

The cost of 155 cars of the pay-as-you-enter type and other cars will be $1,200,087. The insurance money received and to be received for loss of cars which are thus to be replaced is $870,447. The receivers state that the insurance companies declare sprinkler apparatus must be installed in the car houses on account of the numerous fires in the last two years. The receivers say that $11,000,000 worth of property is exposed in the car houses to loss by fire. They add: "This fire hazard jeopardizes the most essential parts of our service. Should another conflagration occur the very heart and vitals of the system are likely to be affected, with the result of most disastrous inroads upon our revenue. To provide against and minimize this present and ever-threatening peril the expenditure of considerable sums is absolutely essential." The receivers say:

It is manifest that so large a sum as that stated above cannot be obtained from current net earnings. Over and above operating expenses we have had to pay since our appointment for taxes and similar obligations to state and city more than $800,000. Our fixed charges to July 1, aggregate $1,354,625. In our judgment it is advisable that all of these fixed charges should be paid as they accrue. So far as we can now determine it is inadvisable to default on any of them, because the revenue derived from the operation of the various lines seems sufficient to meet such charges. In other words, the lines are full self-supporting and it seems advisable under these circumstances from our standpoint to keep the present operating system intact.

The estimated excess of gross receipts over operating expenses to July 1, 1908, is $1,552,274 with operating expenses on their present basis, but it will be less if the public service commission requires, as it did, the petition says, in the case of the Eighth avenue line service in excess of the demands of traffic. The receivers say:

The ratio of receipts for the last seven weeks, compared with that of the corresponding period of last year, begins to show a noticeable improvement when contrasted with the ratio of the last quarter of 1907 and the corresponding period of 1906. This is due in a considerable degree to the increased efficiency of the service following as a direct result of the rehabilitating processes under way. Then, too, the more thorough and complete repairing of electric cars is resulting in our being able to keep more cars in service and fewer in the shops undergoing repairs, with a resulting increase in earning capacity.

It is suggested that the receivers' certificates could be made a lien on the property of the Metropolitan Street Railway superior to the lien of the Metropolitan Street Railway refunding mortgage, which secures $16,604,000 bonds due on April 1, 2002, and bearing interest at 4 per cent, and also to the lien of the Metropolitan Street Railway, general and collateral trust mortgage, which secures $12,500,000 bonds, due February 1, 1997, and bearing interest at 5 per cent. A hearing on the motion to issue these certificates will be given on March 19.

ENGINEERING ASSOCIATION COMMITTEES.

President F. G. Simmons of the American Street and Interurban Railway Engineering Association has announced the following standing committees to supplement those earlier appointed as announced in the Electric Railway Review on December 28, 1907, page 976:

What is Economical Maintenance?

F. H. Lincoln, chairman, assistant general manager Philadelphia Rapid Transit Company, Philadelphia, Pa.

W. H. Collins, general superintendent Fonda Johnstown & Gloversville Railroad (electric division), Gloversville, N. Y.

John Lindall, superintendent motive power and machinery Boston Elevated Railway, Boston, Mass.

Fred Heckler, superintendent motive power and cars Lake Shore Electric Railway, Fremont, O.

W. H. McAloney, superintendent rolling stock Denver City Tramway, Denver, Colo.

T. Scullin, master mechanic Cleveland Electric Railway, Cleveland, O.

Sylvester Potter, master mechanic Detroit United Railway, Detroit, Mich.

Power Generation.

William H. Roberts, chairman, superintendent motive power Northern Ohio Traction & Light Company, Akron, O.

G. H. Kelsay, superintendent power Indiana Union Traction Company, Anderson, Ind.

C. F. Bancroft, superintendent motive power and machinery Boston & Northern Street Railway, Boston, Mass.

G. O. Harvey, electrical engineer International Railway, Buffalo, N. Y.

George B. Dusinberre, consulting engineer, Cleveland, O.

R. A. Dyer, Jr., assistant general manager Rochester Syracuse & Eastern Railroad, Newark, N. Y.

Power Distribution.

W. J. Harvie, chairman, chief engineer Utica & Mohawk Valley Railway, Utica, N. Y.

G. D. Nicoll, electrical and mechanical engineer Indianapolis & Cincinnati Traction Company, Rushville, Ind.

W. H. Matthews, superintendent lines Denver City Tramway, Denver, Colo.

James Heywood, superintendent lines and cables Philadelphia Rapid Transit Company, Philadelphia, Pa.

James P. Boyden, superintendent wires Boston Elevated Railway, Boston, Mass.

Operating and Storage Car House Designs.

F. F. Low, chairman, architect Boston Elevated Railway, Boston, Mass.

E. F. Rogers, chief engineer Boston & Worcester Street Railway, Boston, Mass.

M. H. Brondson, electrical and chief engineer Rhode Island Company, Providence, R. I.

The latest list of committees includes F. P. Maize, chief electrician and master mechanic Rochester Railway Company, in place of W. D. Wright as a member of the committee on maintenance and inspection of electrical equipment.

CENTRAL ELECTRIC RAILWAY ASSOCIATION MEETING.

President F. D. Carpenter announces that the next regular meeting of the Central Electric Railway Association will be held at the Claypool hotel, Indianapolis, Ind., on Thursday, March 26, 1908. After the business meeting, which will convene at 10:30 a. m., the following programme will be presented:

"Standardization of Trolley Wheel, Harp and Pole," by Adam Cole of the Vaile & Kimes Company, Dayton, O.

"Twelve Hundred-Volt Direct-Current System of the Indianapolis & Louisville Traction Company," by H. D. Murdock, master mechanic and electrical engineer, Seymour, Ind.

"Electric Motor and Trailer Trucks," by A. C. Vauclain, Baldwin Locomotive Works, Philadelphia, Pa.

This being the first regular meeting of the year it is earnestly requested that as many as possible will be in attendance. The Central Electric Traffic committee will make its report at this meeting and it is desirous that some definite action be taken relative to a permanent organization.

Through the courtesy of A. A. Anderson, general manager of the Indianapolis & Louisville Traction Company, all members are invited to make a trip over the 1,200-volt section line. A special car will leave Indianapolis immediately after the adjournment of the meeting, remaining over night at some convenient point and resuming the journey on the following morning. It is hoped that a large number of the members will avail themselves of this opportunity.

THROUGH ROUTE IN CHICAGO.

The ordinances under which the Chicago City Railway and the Chicago Railways Company are operating provide that these companies shall establish 21 through routes between the different sections of the city. Under the direction of the board of supervising engineers, Chicago traction, the operation of the first through route will be started at 4 a. m. on March 17. A resolution passed by this board states that, inasmuch as the operation at the present time of through routes Nos. 2 and 3, as described in the ordinances, is impracticable, owing to existing obstructions, the companies are authorized to take the initiative in the establishment of a temporary through route to be known as Route No. 22, consisting of a combination of routes Nos. 2 and 3, as follows:

Beginning at Halsted street and Seventy-ninth street, east on Seventy-ninth to Vincennes avenue; North on Vincennes to Wentworth avenue; north on Wentworth to Twenty-second street; east on twenty-second to Clark street; north on Clark to Howard avenue; returning by the same route, except that the southbound cars will run east on Archer avenue, from Clark to Wentworth, and thence south on Wentworth.

The length of this route is 20 miles, divided about equally between the lines of the Chicago City Railway and the Chicago Railways Company. The time required to make the run from one terminus to the other is two hours, or four hours for the round trip. Each company is to retain the fares collected on its own cars regardless of the territory in which the fares are collected. Under the general arrangement each road is to furnish, as nearly as possible, a proportionate number of cars commensurate with its mileage in the through routes. The number of cars in use on this route will be divided evenly between the two companies, as the mileage is about equal. There has been some discussion concerning the headway, which has been finally determined at eight minutes, requiring the use of 16 cars by each company. Each company is to use its own trip sheets and to be responsible for all accidents occurring on or in connection with its own cars, regardless of the territory in which they may take place.

Through Route in Chicago—Form of Transfer.

The number of the through route is to be carried on the front and rear dash of each car in figures from 10 to 12 inches high. A new form of transfer will be introduced for use on the through routes, and 35,000 of these transfers will be ordered daily at the beginning. This transfer will be accepted on any cross or diverging line except in the central business district, and as a precaution the transfer will be punched in the general direction in which the passenger is bound so as to avoid a reverse trip farther than the next junction point. Separate colors, manila and salmon, will be used respectively for the southbound and northbound cars.

On account of physical obstructions it will not be possible to use the latest type of Chicago City Railway car on this route.

SIGHT-SEEING AND FUNERAL CAR SERVICE IN MEXICO.

BY T. J. NICHOLL.

One of the most popular branches of electric railway service in Mexico City is the "Seeing Mexico" cars. They are painted white and gold on the outside, fitted with beautiful rattan chairs, carpets, silk curtains and cushions on the inside; in fact, everything necessary to make them as comfortable and as luxuriant as any private electric cars in America. These cars leave the Grand Plaza at 9:30 a. m. and 3 p. m. daily, each car in charge of an experienced English and Spanish speaking guide.

Each of the trips requires about 3½ hours. The fare is $2.00 in Mexican money. Two cars are generally required to accommodate the people on each trip. The cars seat from 30 to 50 people (usually all seats are occupied), with a few standing or sitting on camp stools. So it will be seen that the company carries say an average of 45 people on each car, or 180 per day, at $2.00 each, totaling $360 per day. The service is really very cheap, well worth the money and doubtless will be much extended very soon, as it is fast becoming very popular.

An attractive little pamphlet is also used by the company in describing the trips.

Funeral Service.

The story of the splendid street car service given the city of Mexico would hardly be complete without giving a short

Ticket for Sight-Seeing Service in Mexico.

description of the funeral service. There is a special department for this service, which is very much used, and which earns, I am told, about $400 per day. For this service the old horse cars are used to a good advantage. The company controls the funeral service of the city, whether it be by electric car, horse car or carriage, and it is prepared to furnish any kind of service upon short notice given at their office.

With few exceptions the funerals from the city to the cemeteries are conducted by the street railway company, either first-class, second-class or free, the cost varying with the amount of decoration used on the cars. It is not an uncommon sight to see five or six funerals leaving the public square, following one another on the street railway tracks, each with from one to three cars. Some have great quantities of beautiful flowers and ornamentation and others have none.

The funeral car is generally a motor car, but sometimes it is pulled by mules. It is painted and trimmed in black or white. All are single-truck cars, with four square posts supporting the roof at the corners of the car body, forming a parallelogram, say 12 feet long by the usual width of the car. Between the posts on the floor of the car is a raised portion upon which the casket and many of the flowers are placed. The friends of the dead are carried in one, two or three trailers or horse cars. I have seen as many as two trailers filled with floral decorations.

There are also two magnificently furnished and fitted cars called "Carrozas" for extraordinarily fine funerals. These cars cost upward of $10,000 each and have a place in front for the casket, with seats behind for the people. Women never attend funerals in this country. They also have 20 electric and 8 horse "Carrozas," which are used for first and second class funerals, according as may be required, and are decorated to suit for extra expense. The original cost of such a car is $3.75 silver, trailers being paid for at the same rate, whether for flowers or people.

This service saves the people many thousands of dollars annually and at the same time is worth while to the railway company.

The free car for funerals when people are unknown or die absolutely destitute is quite another thing; instead of being entirely open it is entirely closed, with doors on one side opening from top to bottom. There are four doors, with three compartments to each (like pigeonholes), there being 12 places in each car. In each one of these places a body is placed, either in a common board coffin or sewed up in a blanket. The latter cars are furnished at the exact cost of running, twice per day. The service is paid for by the government.

GATEMEN ON THE MICHIGAN UNITED RAILWAYS.

On one interurban division of the Michigan United Railways of Jackson, Mich., the plan was established tentatively on November 21 of having gatemen at the terminals at Battle Creek and Kalamazoo direct passengers to purchase tickets before entering cars. The results attained by this change have been explained to the Electric Railway Review by F. W. Brown, general freight and passenger agent. The plan at present is applied only to limited cars. The cars have gates on the platforms. Before cars leave the Battle Creek or Kalamazoo terminals uniformed employes place stools before the steps and stand beside them to inspect the tickets. The employes who call the trains and request passengers to purchase their tickets are regular employes, and it requires about 10 minutes of their time to attend to this duty for each departing train. There has therefore been no additional expense for the company in the hiring of employes for this service.

Gatemen and conductors are instructed to use their best judgment and not to insist upon the purchase of tickets by any who would be seriously inconvenienced if they were prevented from boarding the car without delay. Before it was decided to try the experiment posters, reading as follows, were placed in conspicuous places: "Passengers will assist the company in providing service of the highest efficiency by purchasing tickets before boarding the train."

In speaking of the plan, Mr. Brown said: "We found that it was very difficult for conductors to attend to the collection of tickets as well as perform their other duties satisfactorily. Between flagging for the crossings, watching the block signals and attending to the trolley when the third rail was reached, the conductors could not work the car properly for fares. If the plan is satisfactory in its operation on limited cars, we will eventually introduce it on the local cars, but if we do that of course additional employes will be required to act as gatemen. The plan leaves the conductors more time to attend to the operation of the cars, and makes it certain that the company will receive fares for all passengers."

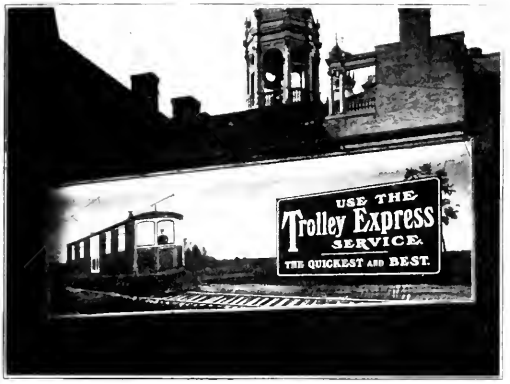
The Ft. Wayne & Wabash Valley Traction Company has recently adopted the Singer uniform for its conductors and motormen on both city and interurban lines. According to the new merit system of discipline recently established the employes will be inspected from time to time and awarded merits or demerits for appearance.

THE NEW BUSINESS DEPARTMENT OF A RAILWAY.

BY C. EDGAR TITZEL, MANAGER CONESTOGA TRACTION COMPANY.

A "New Business" department of a street railway company is just as important as a "New Business" department of an electric light or gas company. Many managers of street railway companies have been very slow to realize this fact. The up-to-date trolley line of today is the one that advertises and solicits business, thereby promoting travel which would otherwise be lost to the road.

The system which the writer represents has maintained a "New Business" department for a number of years to good



Conestoga Traction Company—Illuminated Sign on Top of Waiting Room in Centre Square, Lancaster, Pa.

advantage. We solicit both by personal interviews and by sending out letters and circulars. Four or five times a year we send a circular letter to all the lodges in the county, calling their attention to our service, and inclosing a card giving special car rates and other information of interest to them. In season we send personal letters to the managers of baseball, football and basket ball teams. In the spring we send a letter, together with advertising matter, to all the public school teachers, calling attention to the various pleasure resorts along our lines. Just before the picnic season we send a letter and circular to all Sunday school superintendents, Sunday school teachers, ministers, lodges and factories whose employes are in the habit of holding picnics.

We advertise our express business by sending to the merchants several times a year circular letters and schedules of rates. Keeping up these lists is a very small matter, as it takes very little time after the lists are once compiled.

When county fairs, circuses or other big attractions are held at points which can be reached from our lines, we post big show bills at places where they will attract the most attention. We advertise in the newspapers and by circulars any other event along our lines which will attract travel.

In addition to this system of advertising we have a man who makes a personal canvass. Someone may say that this is a very expensive department to maintain. This is not so; the expense is very small, considering the results obtained. Of course, economy and judgment must be used in the management of this department, just as in all other departments of the business.

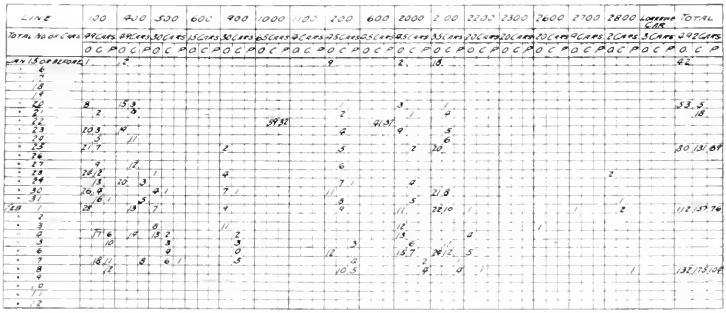
REPAIR WORK PROGRESS RECORD.

With the object in view of having available from day to day a record of the repair work done on the cars of its various classes of rolling stock, there is used at the shops of the United Railways & Electric Company, Baltimore, a record similar to that shown in the accompanying engraving.

The cars of this company are numbered according to lines and each line, it will be noted, is given a separate column on the record sheet. Under each line is stated the number of cars apportioned to that line. The column for each line is subruled into three smaller columns marked "O," "C" and "P." These letters have the following indications: O, overhauling shop; C, carpenter and also motor and truck shop; P, paint shop. Each line across the page represents one day's work in the shops, so that when the office of superintendent of shops receives the record of the work completed during the day before, the various entries may be made.

Considering, for example, the last entries on the sheet as reproduced, that for February 8, we find that of Class 100 twelve cars had been through the paint shop up to that date. Referring to the record for the day before it is seen that on that day eleven cars had been through the paint shop, and therefore one car of Class 100 was completed on the eighth. Similarly, it is noted that of Class 1200 ten cars had been through the carpenter shop and five through the paint shop, and so on across the columns. When inspecting this record it should be remembered that the bottom figures in any column represent the total amount of work done to date.

This method of recording work is found very satisfactory for keeping track of the open cars that are being sent through the shops and prepared for summer service. It is similarly used during the summer for keeping track of the closed cars being repaired for winter service. With the entries made on the record each day the superintendent of shops is posted as to the exact condition of the work, and should it be required he can instruct any particular shop to hasten the work on



United Railways & Electric Company, Baltimore—Continuous Record of Overhauling Work Completed.

cars for the various lines, so that when the equipment is changed for the coming season there will always be enough cars on each line to fulfill the schedules.

Wood blocks laid alongside rails are said to be preferred on asphalt paved streets in Frankfort, Germany, to any other system of connecting the street tracks and the paving. The blocks are laid over the whole space between the rails and for some distance outside the rails.

OPERATIONS OF ELECTRIC RAILWAYS IN ILLINOIS.

The annual report of the Illinois railroad and warehouse commission covering the operations of railways for the year ended June 30, 1907, states that "the interurban electric railroads are taking a very important position in the state and are helping to solve in many ways the various transportation problems, especially those pertaining to local traffic." The electric railway part of the report covers only strictly interurban lines and elevated roads within the state of Illinois, street railways being exempted by statute from the jurisdiction of the commission. In this connection the report says: "So far as this commission is aware street railway companies make no report to any department of the state government. This commission has frequent inquiries as to the condition of street railway companies, and it might be well to suggest that these public utility companies enjoying special privileges from the state and municipal governments ought to be required to make a report to some department so that public information might be had of their condition."

An abstract of the report follows:

Mileage.

The total mileage, main line and branches of interurban and elevated electric railways, for the year was 1,184.83, an increase for the year of 249.07 miles. The total mileage of second, third and fourth main tracks was 192.99, an increase of 2.29 miles. The mileage of industrial tracks was 7.80 miles, an increase of 3.67 miles, and the mileage of yard tracks and sidings was 71.30 miles, making a total of tracks of all kinds of 1,456.92 miles, an increase for the year of 269.49 miles.

Capitalization.

The capital stock and funded debt of this class of roads for the year was $177,443,007, an increase for the year of $16,855,779, which is accounted for in the additional mileage built and put in operation. The average capitalization (capital stock and funded debt) per mile of road of interurban and elevated electric railways for the year was $150,790. The average capitalization (capital stock and funded debt) per mile of surface roads was $73,053, and per mile of road for the elevated railways was $1,967,780.

The total dividends paid were $1,134,365, an increase of $391,396. The total assets were $195,474,221, an increase of $21,749,623. The total liabilities were $190,978, an increase of $21,251,727. The net surplus of assets over liabilities was $4,496,180.

Income Account.

The gross earnings from operation were $13,956,210, an increase of $1,676,018. Operating expenses were $7,747,332, an increase of $1,174,071. The income from operation was $6,208,878, an increase of $501,947. The income from property and other sources was $892,866, an increase of $210,021. The total income was $7,101,744, an increase of $711,968. The expenses assignable to fixed charges were $4,986,165, leaving a net income of $2,381,798, an increase of $385,299.

Passenger and Freight Traffic.

The total income from passenger service, including mail, express, advertising, etc., was $12,371,696, an increase of $1,354,776. The total income from freight service was $594,371, an increase of $148,051. The total earnings and income from all sources was $14,594,557, an increase of $1,589,137. A comparative summary of traffic statistics is as follows:

	1907.	1906.
Passenger traffic—		
Revenue passengers carried	197,781,911	183,650,979
Passenger and mixed car mileage	55,863,475	51,849,607
Passenger earnings per car-mile		$ 0.212
Average amount received from each passenger	$ 0.065	0.059
Passenger earnings per mile of road	10,550	11,771
Transfer passengers carried	7,638,759	6,397,108
Freight traffic—		
Tons of revenue freight carried	1,452,118	1,277,566
Freight and mixed car mileage	170,056	689,950
Average receipts per ton per mile		$ 0.048
Freight earnings per car-mile		0.656
Average amount received from each ton of freight	$ 0.40	0.350
Freight earnings per mile of road	820	751
Summary—		
Gross earnings from operation	$ 13,956,210	$ 12,122,661
Total car mileage	56,333,531	53,378,585
Total earnings per car-mile		$ 0.232
Gross earnings per mile of road	$ 11,552	12,820
Operating expenses per mile of road	6,458	6,883
Net earnings per mile of road	5,094	5,937

Expenditures.

The total expenditures for maintenance of way and structures, maintenance of equipment, conducting transportation and general and unclassified expenses and fixed charges amounted to $12,359,500, an increase of $1,459,292. The expenditures are classified as follows:

Maintenance—	1907.	1906.
Way and structures	$ 720,283	$ 564,470
Equipment	1,001,739	921,832
Transportation—		
Operation of power plant	1,602,627	1,359,872
Operation of cars	2,731,678	2,377,785
General expenses	1,579,105	1,255,219
Unclassified expenses		29,752
Total operating expenses	$ 7,635,432	$ 6,508,930
Total fixed charges	4,724,068	4,391,278
Total oper. exp. and fixed charges.	$12,359,500	$10,900,208

Employes.

The number of officers and employes was 6,697, a decrease of 29. There was paid in salaries $4,479,742, an increase of $513,980. The average rate of compensation per day for all employes, excluding officers, was $2.15, an increase of $0.12. The average rate of compensation per day, including officers, was $2.19, an increase of $0.07.

Miscellaneous Data.

During the year 6,860 tons of steel rails and 161,761 new ties were laid. There are 441 stations on these roads, an increase of 90. The number of highways crossed at grade is 2,475, an increase of 329. The number of under highway crossings is 449 and the number of overhead highway crossings is 13.

Accidents.

The number of passengers killed was 19, an increase of 12; the number of employes killed was 19, an increase of 9; other persons killed 38, an increase of 7; the total number of passengers injured was 149, an increase of 52; other persons injured 81, an increase of 16; total number of all classes killed 76, an increase of 28; total number of all classes injured 708, an increase of 240.

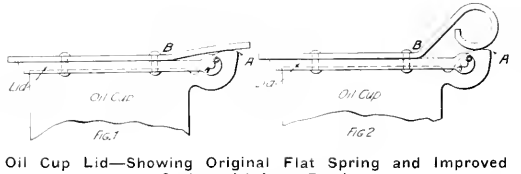
The commission has been gathering information as to the methods in use in the operation of the trains and cars of the interurban and elevated electric railroads and the extent and nature of safety appliances used for the protection of the public, and it may be necessary to establish some standard of operation.

Taxes.

The amount of taxes paid in 1907 was $664,322.93, an increase over the preceding year of $81,355.09, and an increase since 1897 of $585,274.29.

SPRING FOR OIL CUP LID.

The accompanying sketches, Figures 1 and 2, will serve to show how one master mechanic has changed the springs



Oil Cup Lid—Showing Original Flat Spring and Improved Spring with Long Bend.

on his armature and axle bearing oil cup lids so that they will afford a longer useful life.

Figure 1 shows the lid and spring as furnished with the motor. After having been in use a short time this flat spring takes a permanent set at B. This renders it useless because it will not hold the lid down and keep out the dust and dirt.

Figure 2 shows the form of spring which has been used to replace that shown in Figure 1. The new spring shown in Figure 2 is made of $\frac{3}{8}$ by 1 inch spring steel and requires more stock than the spring as supplied by the manufacturers. However, when the lid is raised the curve on the end allows the spring to compress through a greater portion of its length, and therefore it does not take a permanent set near the rivet B. When the lid is raised the curved portion of the spring passes over the point marked A in Figure 2 and as the lid is again closed the spring resumes its orignal shape, retaining its compressive strength, which keeps the oil cup lid tight at all times.

NIGHT SCHEDULE ON BOSTON ELEVATED RAILWAY.

In response to numerous requests for information relating to the starting time of night cars from the in-town and the suburban termini, the Boston Elevated Railway has published

Night Schedule on Boston Elevated Railway.

the accompanying diagram, showing the schedule now in force. The large circle in the original diagram is 6¼ inches in diameter.

D. D. Price, superintendent of motive power of the Cumberland & Westernport Electric Railway, Frostburg, Md., has an ingenious method of screwing large-sized pipe in a plant the equipment of which does not include a wrench of the proper size. A piece of chain is doubled and wrapped around the pipe. The ends are slipped through the loop. The end of a crowbar is then inserted in the doubled end in such a position that the pipe may be turned by raising the end of the bar. To make the chain grip the pipe a piece of iron, with one side rough or provided wth small steel pins, is placed between the chain and the pipe and bolted to the chain.

AUTOMATIC SYNCHRONIZING.

At a meeting of the Western Society of Engineers, Chicago, March 11, Prof. Morgan Brooks of the University of Illinois presented a paper entitled "Alternators in Parallel." A part of this paper describing a method for synchronizing alternators without regard to phase relation, of particular interest to operators of railway alternating-current machinery follows:

In order to operate alternators in parallel it is first necessary to synchronize the machines. This process, once difficult, has been rendered quite simple by the use of the synchroscope with its clear indication of vector relations, showing the attendant the proper moment for switch closing.

As in direct-current parallel operation, approximately equal terminal voltages must be secured, but now the problem includes the much more critical conditions of approximate speed equality, of same phase rotation, and of sensibly identical vector position, before the paralleling switch can be safely thrown. It is even possible by a device now on the market to have the switches closed automatically when vector relations are correct, relieving the attendant of the strain of his work. There is no great difficulty in making a good record under normal operating conditions, but in an emergency, when quickness of action is most necessary, undue haste may cause an imperfect switch closing or possibly, as in railway substations, an irregular load may make the conditions as indicated by the synchroscope so erratic as to confuse the operator.

A method of self-synchronizing has been devised in which the reactions commonly the result of imperfect switching are so reduced as to permit the switch to be closed at any time regardless of phase relation of the incoming machine. Purposely bad synchronizing produces a mere flicker of the lighting load, and ordinary synchronizing is absolutely devoid of disturbance of any kind. The scheme is merely the temporary insertion between machines (using but one phase in two or three phase machines) of an inductive coil without an iron core. The action of this coil limits greatly the possible current rush on imperfect switch closing without limiting to the same degree the synchronizing power of the machines to pull into step, necessary to complete the process.

It is known that in transformers the initial primary current on switch closing may be abnormal, especially in case of unfavorable residual magnetism. When two alternators are connected together while differing in phase the magnetism of the two machines cannot be precisely in the relation required for least cross-current, and an abnormal rush of current may result. In case of opposition of phase (180 degrees) the case is equal to a sudden short-circuit resulting in a current rush of perhaps twenty times full-load current, although a gradual but complete short-circuit may not develop more than three times full-load current. This current rush or surge is sufficiently reduced by a rather small coil of wire, whose reactance does not depend upon iron, and which, like resistance, seems instantly ready for duty. A coil costing about 1 per cent as much as the machine served is often found sufficient for the purpose. The small size of the coil required for self-synchronizing has been a surprise. With such coil it has been found possible to close the switch connecting the bus-bars and a machine to be synchronized before it is even started, when it will easily fall into step upon attaining proper speed. This is not to be recommended, as it will cause an undesirable reaction upon the existing load, unless an unduly large coil be provided.

Experiments have shown that best results are obtained in synchronizing an incoming generator when it is running

a trifle "fast," as switching in puts a load upon it, slowing it down. Similarly an incoming converter should be running "slow," as the current flowing into the motor will normally produce motor action tending momentarily to increase speed. Attention to this difference will often prevent an oscillation of machines.

The use of the self-synchronizing method will not permit alternators improperly driven to operate successfully together. The stringent requirements of the synchronous machines for uniform driving torque has served to greatly improve the regulation of all prime movers, although the problem of engine governing is not yet fully solved. When it is realized that two engines driving alternators in parallel must not vary so much as one mechanical degree in position from uniform rotation, due to cyclic variation, and must change speed simultaneously and equally in case of a change of load, it is seen how difficult the problem is.

REFRIGERATOR CAR FOR THE FT. WAYNE & SPRINGFIELD RAILWAY.

The Ft. Wayne & Springfield Railway of Decatur, Ind., placed a refrigerator car in service on February 13. The car was built at the shops of the company at Decatur under the direction of T. W. Shelton, superintendent of the company, and is intended primarily to be used for the purpose of transporting meat from the plant of the Decatur Packing Company at Decatur to various towns and cities reached by interurban electric railways in northern Indiana and western Ohio.

Refrigerator Car for the Ft. Wayne & Springfield Railway.

The car will be operated over the Ft. Wayne & Springfield Railway from Decatur to Ft. Wayne. Connection is made at that point with the lines of the Ft. Wayne & Wabash Valley Traction Company, the Toledo & Chicago Interurban Railway, the Ohio Electric Railway, the Indiana Union Traction Company and the Marion Bluffton & Eastern Traction Company. Through these connections shipments can be made to Wabash, Peru, Logansport, Ft. Wayne, Huntington and Muncie. Other points will be included as business is extended. The car will be attached to the regular freight car which makes trips between Decatur and Ft. Wayne.

The bottom frame of the car is of oak of continuous pieces. The two outside sills are 4 by 12 inches and the intermediate sills are 4 by 8 inches, all sills being tied together with $\frac{3}{4}$-inch rods. All the filling blocks are mortised and tenoned into the intermediate and side sills. The posts are of oak, 3 by 3 inches in section, and are fastened to the top plates by means of angle irons bolted through the posts and plates, the bottom being fastened in a similar manner. The posts are 2 feet center to center. The roof framing, including carlines, is of oak. Steel carlines, $\frac{3}{8}$ by $1\frac{1}{2}$ inches, extend from one top plate to the other, being bent to the shape of the roof and placed 3 feet apart, securely bolted to the top plates and carlines. The roof is covered with $\frac{3}{8}$-inch poplar and 6-ounce cotton duck. Before the canvas was applied the roof was covered with two coats of lead and oil. The roof is of monitor type, with steam coach type of hood. The space between the deck rail and the roof is sealed and filled with sawdust. The floor consists of $1\frac{1}{2}$-inch oak laid crosswise and $\frac{7}{8}$-inch pine flooring laid lengthwise. The interior finish is yellow pine, tongued and grooved, placed lengthwise. The space between the sheathing is filled with sawdust. Suitable racks are provided, fitted with hooks for hanging meat. The ends of the car body are partitioned and have doors leading from the platforms to the interior of the car. There are 6-foot doors on the sides of the car at the center, heavy false doors which are to be used in warm weather, and a small door in each vestibule.

The Edwin C. Washburn M. C. B. type of drawbar with K draft rigging is used. The trucks are standard M. C. B. freight trucks, 5-foot wheel base and 25-foot truck centers. The brake rigging is automatic air and hand power and has compound levers. The wheels are 34 inches in diameter with 3-inch tread and $\frac{7}{8}$-inch flange. Various different styles of short coupling bars are carried on the car so that it will be possible to make couplings with the various drawbars in use on different roads over which the car will be operated. The total length of the car is 40 feet and the width is 8 feet 4 inches. The car has a capacity of 50,000 pounds. As ice can be placed in the car during the summer months the company will use the car for transporting beer and other materials as well as for carrying the packing house products for which it was primarily built.

On the first trip on February 13 the car was loaded with 20,000 pounds of meat shipped from Decatur via Ft. Wayne to Huntington, Wabash, Peru and Logansport. The Ft. Wayne & Springfield Railway has a contract with the Decatur Packing Company for the transportation of all products that can be carried over its line and connecting electric lines.

The car is painted with Sherwin-Williams standard Pullman color. The Sherwin-Williams specifications for car painting were used, and English varnish, sold by the Pratt & Lambert Company of Chicago, was applied afterward.

Quarterly Meeting of New York Association.

Secretary J. H. Pardee announces that the quarterly meeting of the Street Railway Association of the State of New York will be held on March 18 at the Fort Orange Club, Albany, N. Y. At this meeting the association will discuss the tentative classification of operating expenses recently proposed by the interstate commerce commission.

LONG-DISTANCE TRANSMISSION IN AFRICA.

On March 4 Ralph D. Mershon, consulting engineer, New York, spoke before the Pittsburg section of the American Institute of Electrical Engineers. He described the proposed transmission plans for South Africa. Mr. Mershon said that the Victoria Falls Power Company was formed for the purpose of transmitting power from Victoria Falls, on the Zambesi river, to Johannesburg and the Witwaters Rand, for use in the gold mines there. The distance of transmission will be between 600 and 700 miles. Mr. Mershon was retained to report upon the feasibility of such a transmission, his report being one of several, the other reports relative to the matter being made by European engineers.

The problem to be solved and the question to be answered were: Given the water power at Victoria Falls which could be developed hydraulically at a given cost, and given at Johannesburg a market for a certain amount of power at a certain price, could the power be profitably transmitted? Those of the European engineers who considered the project feasible thought it could be carried out only by means of the Thury direct-current system of transmission; but Mr. Mershon's report showed that the transmission could be accomplished with alternating current and that there would be considerable advantages in using alternating current. At the same time he advised the Victoria Falls Power Company that it would be better to first install steam stations on the Rand, and, through the medium of these stations, educate the mine owners to the use of electrical power and get control of developing the power market until the load was sufficient an amount to justify the transmission. Otherwise, if the transmission were built, the power company might be in the position of having to carry for a number of years a heavy investment while the load on the transmission system was being built up. The course outlined in regard to the steam stations is being followed.

Victoria Falls, the power-generating site, are in the Zambesi river, at a point where the river is about a mile wide. Their height is 400 feet, or 2½ times that of Niagara Falls. At the falls there is a hotel for tourists, and every endeavor is being made to encourage tourist travel to this point. The Rhodesian Railways at the present time extend about 400 miles north of the falls.

Electric Traction in Lorraine.

Two thousand volt direct-current locomotives are used on a meter-gauge mine railway of about nine miles length in Maizières, Lorraine. The gradients of the railway are 2 and 3 per cent in parts, and ore trains of 250 to 300 tons are hauled over it. Hitherto the service has been performed by steam locomotives, but now electric traction has been installed. Direct-current motors were chosen because it was possible to get motors of larger capacity into the available width than with other systems. The locomotive has two 4-wheel trucks, and each of the four axles carries a motor, whereby a total hourly capacity of something over 600 horsepower is obtained. The motors are connected permanently two in series and are fed by overhead wire carrying 2,000 volts pressure, with rail return. The current collector is a side-contact sliding conductor of the Oerlikon type. The line is fed from a 600-kilowatt converter station at either end of the line. The locomotives have 49-inch drivers and weigh 60 tons each. The motors have commutating poles.—Engineering News.

A novel method of supplying steam to the electric power station of the Great Central Railway at Marylebone, England, was used while the boilers were undergoing thorough cleaning. The road operates both steam and electric equipment, and four locomotives of the latest type were placed close against the power house, fired up, and pipe connections arranged to carry steam to the engine room.—Railway and Engineering Review.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY E. L. ROSENBERGER LL. B., OF THE CHICAGO BAR.

Proper Remedy for Enforcing Performance of Duties in Respect to Highways.

Borough of Pleasantville v. Atlantic City & Suburban Traction Company, 68 Atlantic Reporter, 60.—The supreme court of New Jersey holds that mandamus is a proper remedy for enforcing performance by a traction company of duties in respect to the public highways occupied by it pursuant to the terms of the municipal ordinances under which such occupation is enjoyed.

Company Held to Provisions for Half Fare for School Children Regardless of Constitutionality of Law.

Interstate Consolidated Street Railway Company v. Commonwealth of Massachusetts, 28 Supreme Court Reporter, 26.—The supreme court of the United States says that this was a complaint against the street railway company for refusing to sell tickets for the transportation of pupils to and from the public schools at one-half the regular fare charged by it, as required by Section 72 of Chapter 112 of the revised laws of Massachusetts. At the trial the railway company admitted the fact, but set up that the statute was unconstitutional, in that it denied to the company the equal protection of the laws and deprived it of its property without just compensation and without due process of law.

In support of this defense the company made an offer of proof which may be abridged into the propositions that the regular fare was five cents, that during the last fiscal year the actual and reasonable cost of transportation per passenger was 3.86 cents, or, including taxes, 4.10 cents; that pupils of the public schools formed a considerable part of the passengers carried by it, and that the one street railway expressly exempted by the law transported nearly one-half the passengers transported on street railways and received nearly one-half the revenue received for such transportation in the commonwealth. The offer was stated to be made for the purpose of showing that this company could not comply with the statute without carrying passengers for less than a reasonable compensation and for less than cost. The offer of proof was rejected, and a ruling that the statute was repugnant to the fourteenth amendment to the constitution of the United States was refused. The company excepted, and, after a verdict of guilty and sentence, took the case to the supreme judicial court of Massachusetts, which overruled the exceptions.

The supreme court of the United States is of opinion that the decision below was right. A majority of the court considers that the case was disposed of by the fact that the statute in question was in force when the company took its charter, and confines itself to that ground. It says that by the act of incorporation the company was "subject to all the duties, liabilities and restrictions set forth in all general laws now or hereafter in force relating to street railway companies, except," etc. There is no doubt that, by the law as understood in Massachusetts, at least, the provisions of said Section 72, if they had been inserted in the charter in terms, would have bound the corporation, whether such requirements could be made constitutionally of an already existing corporation or not. The railroad company would have come into being and have consented to come into being subject to the liability, and could not be heard to complain.

If the charter, instead of writing out the requirements of Section 72, referred specifically to another document expressing them, and purported to incorporate it, of course the charter would have the same effect as if it itself contained the words. If the document was identified, it would not matter what its own nature or effect might be, as the force given to it by reference and incorporation would be derived wholly

from the charter The document, therefore, might as well be an unconstitutional as a constitutional law. But the contents of a document may be incorporated or adopted as well by generic as by specific reference, if only the purport of the adopting statute is clear.

Reasonableness and Application of Ordinance Requiring Sufficient Cars to Give Seats and to Save Long Waiting.

North Jersey Street Railway Company v. Jersey City, 67 Atlantic Reporter, 1072.—The supreme court of New Jersey says that there was brought under review in this case an ordinance regulating the running of trolley cars in Jersey City from the terminals at the Pennsylvania and Erie stations during the evening "rush" hours. This required, under penalty, that all corporations running trolley cars in the city between the hours of 5:30 and 7 p. m., run from their terminals at the Pennsylvania and Erie stations a sufficient number of cars to provide with a seat every passenger from whom a fare was demanded, and that they should run a sufficient number of cars from said terminals during such hours that persons desiring transportation should not be kept waiting longer than five minutes.

It was contended that this ordinance was unreasonable because it was impossible to comply with it. But no attempt was made to show that the ordinance was impossible of observance at the Erie terminal or was otherwise unreasonable so far as that terminal was concerned. To this extent, therefore, the court without discussion finds the ordinance reasonable.

With regard to the Pennsylvania terminal it appeared that nine lines of cars used it, all incoming cars being confined for about two blocks to a single track, as also were the outgoing cars. The headway between cars on the different lines during the rush hours varied between 2 and 12 minutes, and a car of one or another of the various lines left the terminals at intervals approximating 40 seconds during the afternoon rush hours. The principal difficulty resulted from the large number of ferry boats that somewhat irregularly arrived at that point between 5:30 and 7 p. m., crowded with passengers, who, for the most part, desired to make their way homeward by the trolley cars.

Nevertheless the court is satisfied from the evidence that this company might with proper effort have dispatched from this terminal during the rush hours in question a considerably greater number of cars than it did. It says that, no doubt, under any schedule or system of running the cars, interruption might occasionally be caused by extraordinary blockades in the street or by other circumstances over which the traction company had no control. The ordinance, however, should be given a reasonable interpretation, and it was not to be supposed that the company would be held liable for the results that might occasionally be produced by causes beyond its control.

Upon the whole, the court cannot say that the requirements of the ordinance with respect to the dispatch of cars from the Pennsylvania terminal were either impossible of performance or so difficult of performance as to render the ordinance oppressive. The operation of the ordinance was therefore not wholly unreasonable. Exceptional circumstances that might render its performance impossible in particular instances might be availed of by way of defense, if action was brought for recovery of the penalty that the ordinance prescribes.

The ordinance not appearing to be at all unreasonable in its application to the Erie terminal, and not under all circumstances unreasonable in its application to the Pennsylvania terminal, it should be permitted to stand to the end that it may be enforced, except in particular cases where it may be made to appear that the circumstances render the operation of its provisions unreasonable or oppressive.

News of the Week

Consolidation Discussed in Chicago.

Talk of consolidation of the properties of the Chicago City Railway and the Chicago Railways Company has been started by Walter L. Fisher, special traction counsel for the city of Chicago. Mr. Fisher declared that with the present division of ownership the short haul traffic is lost by the companies and that many people in the business district would ride for short distances if they were able to take cars for more satisfactory distances than the present terminal plans of the two companies permit.

Discussion of the advisability of consolidation of the four elevated railroads of Chicago has been started again. It is generally recognized that this consolidation will be brought about eventually.

Detroit 3-Cent Fare Ordinance Enjoined.

On March 3 the city council of Detroit, Mich., passed the so-called Holly ordinance, which requires the Detroit United Railways to establish a 3-cent fare on all lines for which the franchises have expired and to give universal transfers from those lines to other lines operated by the company. The ordinance was promptly signed by the mayor. On March 3 Judge Swan of the United States circuit court dissolved an injunction restraining the council from enacting the ordinance, on the grounnd that the court did not have authority to restrain legislation, but immediately after the passage of the ordinance he issued another temporary injunction restraining the city officials from enforcing it. The injunction was obtained on the petition of the Guaranty Trust Company of New York, representing the bondholders. A final hearing of the case will be held on March 16.

Forestry and Hydro-Electrical Work.

At the eighth meeting of the Pittsfield, Mass., section of the American Institute of Electrical Engineers, held March 5, Mr. H. L. Smith presented an original paper on "Forestry and Hydro-Electric Development." Mr. Smith gave figures showing the enormous requirements for timber and the alarming rate at which our forests are being denuded. The effects of fire and the ruthless destruction of the young timber, due to the inconsiderate logging methods of rapacious lumbermen, were compared with the more considerate cutting done in the forest reservations under government supervision.

The beneficial effects of forest preservation, along the headwaters of the tributaries of the larger rivers, in the regulation of the stream flow, and in the prevention of disastrous freshets was described in detail. A brief outline was given of the work of the United States geological survey in the gauging of important streams. The fact that at the present rate of cutting, practically the entire hardwood supply will be exhausted in 16 years was brought out and an appeal made to give support to all worthy measures which would check the present ruthless destruction of our great timber tracts.

Proposed Subway Between Philadelphia and Camden.

Announcement was made this week of the plans of the Delaware Subway Railway Company to build a twin-tube tunnel for electric cars under the Delaware river between Camden, N. J., and Philadelphia, Pa. The project has been delayed by extended litigation, but an important obstacle has been cleared away by a recent decision of the New Jersey Supreme Court. The Subway Company condemned a terminal site at Camden on property owned by the Philadelphia & Camden Ferry Company, a subsidiary of the Pennsylvania Railroad, adjacent to the ferry terminal. A commission, appointed by the court, assessed the damages at $100,000. The ferry company, which has strenuously opposed the subway plans, contested the finding of the commission on the ground that amount was too low, and asked compensation for the prospective loss of business by competition. The court decided that this question could not be admitted. The ferry company has taken the case to the court of appeals.

The tunnel is to be financed by a syndicate, headed by Clarence and Edwin Wolf, bankers of Philadelphia. To procure the rights to build on the Jersey side a corporation called the Intercity Link Railway was formed. To obtain the Pennsylvania charter and the Philadelphia franchises, the Philadelphia & Camden Railway was organized and subsequently other rights were secured under the title of the Delaware Subway Railway. Of these concerns Clarence Wolf is president, Edwin Wolf treasurer and Morris Wolf secretary and legal representatives. Plans have been prepared by Stearns & Castor of Philadelphia. The approaches will amount to

about one-half mile and the length of the tubes under the river will be 2,700 feet. Property for the Philadelphia terminal has been acquired. The tunnel will form an important connection between the electric railway systems of Pennsylvania and New Jersey and will provide more comfortable transportation than is now possible by ferry. It is planned to begin construction as soon as the appeal of the ferry company is settled.

Trial of Suit to Annul Charter of New York City Railway.

Paul D. Cravath, attorney for the New York City Railway, will not introduce any evidence in defense of the charges of the attorney-general of New York that the company had been insolvent for one year prior to September 24, when the receivers were appointed. The trial before Justice Davis of the New York supreme court therefore came to an end on March 10. Mr. Cravath and H. R. Limburg, special counsel for the attorney-general, will submit briefs.

An effort has been made by Mr. Limburg to secure the introduction of the evidence of H. H. Vreeland before the grand jury. District Attorney Jerome, who had been subpoenaed, told the court that Mr. Vreeland's testimony related almost entirely to the Metropolitan Securities Company. Finally Justice Davis said he would look over the grand jury evidence to see if it is admissible. Mr. Cravath said: "Mr. Vreeland is not a stockholder in the New York City Railway, and, therefore, his testimony cannot be called on this question."

At the hearing on March 4 it was stated that the only franchise owned outright by the New York City Railway was the so-called "Halsey franchise," for two miles of track in the Bronx, purchased for $15,000. H. R. Limburg, special attorney for the attorney-general, questioned H. W. Browne, auditor of the company, regarding the allowances for depreciation of equipment.

Mr. Browne maintained that a proper entry was always made for such depreciation and that if it appeared small the reason was that the stock purchased was of such good quality that no great allowance was necessary until after the third year of use.

Mr. Limburg asked the witness to explain the item of $200,000 in the yearly report for "renewal of horses." Mr. Browne explained that the company figured the working life of a horse at four years, and that for the purposes of accounting three-fourths of the purchase value of the horses owned by the company was carried as an asset every year. Similarly, he said, any expenditure which covered a series of years was distributed over each year in equal proportion.

Of the $9,255,476 "open accounts" in the balance sheet of June 30, 1906, it was shown that $2,534,602 consisted of "advances to subsidiary companies." Of the latter amount $1,405,000 met operating deficits. On June 30, 1907, $1,875,956, advanced to meet operating deficits, was still due by subsidiary companies.

During the proceedings on March 9, Mr. Limburg argued that approximately $7,000,000 of special franchise taxes unpaid and contested by the company in court, should have been considered a contingent liability on June 30, 1906. Mr. Limburg said that the Metropolitan Street Railway borrowed in 1904 the sum of $793,423 to pay its franchise taxes up to and including 1900. He stated that this loan showed that the suits brought by the New York City Railway for the purpose of contesting the constitutionality of the special franchise tax law were not entered into in good faith. The attorneys for the company argued that assessments under this law could not be considered even a contingent liability, because the company was contesting them in good faith.

Mr. Limburg asked for the contracts relating to the purchase of control of the Twenty-eighth and Twenty-ninth streets Crosstown Railroad by the Metropolitan Street Railway. It had been shown in previous proceedings that these lines were purchased at receiver's sale for $25,000 in 1896, recapitalized with $1,500,000 stock and $1,500,000 bonds through the Metropolitan Traction Company, and then sold to the Metropolitan Street Railway, which issued its stock to the Metropolitan Traction Company for the stock of the two lines, guaranteeing principal and interest of the bonds. The two lines have failed to earn the interest on their bonded debt and were indebted to the Metropolitan Street Railway on this account $54,819 up to June 30, 1906. Mr. Limburg contended that under the lease of 1902, the New York City Railway was made liable for both the principal and interest of the bonds, and that as the road had not earned the interest itself, the principal was a contingent liability of the New York City Railway.

The securities carried as an asset valued at $8,658,527 in the balance sheet of the New York City Railway as of June 30, 1906, were attacked by Mr. Limburg, who charged that with the exception of two small blocks of 87 and 168 shares, respectively, and the $500,000 Fulton Street and $1,500,000 Twenty-eighth and Twenty-ninth Street stocks all were hypothecated as collateral for all loans.

A statement was placed in evidence by Mr. Limburg showing that of the $23,000,000 raised by the sale of the Metropolitan Securities Company stock, the New York City Railway received only $20,259,000. It was also shown that an entry in the balance sheet as of June 30, 1906, entitled "reserve for net deficits," represented the deficits of the subsidiaries of the Third Avenue Railroad, amounting to $2,256,330 less $751,279, the surplus of the Union Railway. These deficits had been made by advances of the New York City Railway and were carried by that company.

Transportation Affairs in New York.

On March 6 the New York public service commission of the first district held a public hearing in regard to the traffic on the Brooklyn bridge since January 27, when the extension to the Manhattan terminal was put into service and the plan of operating the Brooklyn Rapid Transit Company elevated trains through to Manhattan was established and the old bridge shuttle service was abandoned. These improvements were described in the Electric Railway Review of February 1, page 154. H. B. Seaman, chief engineer of the commission, has submitted a report criticizing the new plan of operation. Arthur W. Dutton, superintendent of transportation of the Brooklyn Rapid Transit Company, testified that since the new plan was established the company has been operating 820 6-car elevated trains per day across the bridge, as compared with 708 before January 27. The maximum number of 6-car trains that can now be run across the bridge is 61 per hour and it is hoped that this number can be increased to 70. A count made on February 17, shows that 59,994 passengers were carried over the bridge between 4 and 7 p. m. under the new system, as against 57,207 under the old system, as shown by a count on October 27. Mr. Dutton also said that running trains through to Park Row placed at the disposal of the company the old terminals at the Brooklyn end of the bridge, from which they could run out practically empty trains to accommodate Brooklyn passengers. The company has put in service 100 new steel elevated cars and has greatly increased the service on several of its lines. The hearing was continued on Tuesday of this week. Mr. Dutton said that the opening of the Brooklyn subway had lessened considerably the traffic on the bridge and that by means of the through trains the rush hour crowds over the bridge were now better handled than ever before. He said that the only way to use shuttle trains to advantage would be to build a large terminal at the Brooklyn end of the bridge.

The public service commission and Mayor McClellan appear unable to agree as to whether the city authorities or the commission should first consider the proposition of the Interborough-Metropolitan Company to sell the Belmont tunnel to the city. As reported in last week's issue of the Electric Railway Review, the company offered to sell the tunnel to the city for the cost of construction, $7,239,477 and suggested that the city enter into an operating contract with the New York & Queens County Railway, controlled by the Belmont interests, for 25 years, the city to pay one-half of the estimated operating expenses and the balance to be met by the company; the city to take the local fares until reimbursed for its advances for operating expenses and interest on bonds issued to pay for the tunnel and 1 per cent for a sinking fund, the company to take the through fares, and when the city has been reimbursed, the local fares to be divided equally between the city and the company. A delegation from the borough of Queens called upon the mayor on March 10 to urge the purchase and were referred to the commission. They then called upon Chairman Willcox and were told that the commission had nothing to do with the matter until the city authorities decided favorably on the question. The position of the commission is based upon an opinion rendered by George S. Coleman, counsel to the commission, who said in part:

"I am of the opinion that this proposition is one for the decision, in the first instance, of the city authorities which have to do with the expenditure of public money. If the proposition does not commend itself to the city, the advice of the commission is needless.

"If the city authorities are inclined to favor this proposition, the matter may later come before this commission for its approval under the provisions of the public service commissions law or for its aid and co-operation in the carrying out of the same under the provisions of the rapid transit act, but this latter act, in its present form, gives to the commission no powers which would allow the purchase of an existing railroad or tunnel with public money, and the rapid transit act would have to be amended in order to grant any such authority for the purchase of a railroad or tunnel in lieu of construction of the same at the public expense, and to provide for any such

co-operative arrangement for operation and taking of fares in lieu of a guaranteed rental, as now provided to cover interest and sinking fund for bonds issued to pay for the public improvement."

Plans for the construction of additional subways in New York City received a severe setback on March 9 when Comptroller Metz announced that the city would have no available funds this year and probably not for the next two years, which could be employed for the construction of subways. This announcement was made following a conference in Mayor McClellan's office attended by officials of the city financial department and the chief engineer of the board of estimate. It was estimated that the city's borrowing capacity on July 1, under the constitutional provision restraining the city from issuing bonds in excess of 10 per cent of the assessed real estate valuation, would be only $33,000,000 and that imperative city improvements which have not yet been provided for would use up that remaining amount. The plans for the Brooklyn Fourth avenue subway are now being revised and still have to be passed upon by the board of estimate. Chairman Willcox of the public service commission stated on March 5 that he hoped to be able to advertise for bids within two weeks. The plans for the Broadway-Lexington route are now being considered by the board of estimate. A plan has been suggested that only the amount required for one year's construction work be charged against the city's debt limit, instead of the entire amount of the contract. This plan might make it possible to begin the construction of one of the subways at once. The corporation counsel is expected to render an opinion as to the feasibility of the plan in a few days.

Legislation Affecting Electric Railways.

Massachusetts.—The Boston Elevated Railway has withdrawn from the legislature its bill to provide authority to acquire control of connecting street railways by purchase of stock. The action follows efforts of the Public Franchise League to oppose the measure in the legislature and to stir up public opinion against it as a dangerous bill. The company takes the ground that it will not seek legislation that is against the wishes of the public.—In regard to the bill of the Boston Elevated Railway to allow it to purchase the West End Street Railway, now held under a lease, the legislature, after receiving a favorable report from its committee on street railways, has asked the railroad commission to state what public benefits would result from the passage of the act and the consummation of the purchase. The commission was to report on March 9, but they have asked for 30 days additional time for investigation.

New York.—George M. Palmer has introduced in the house a bill to amend the public service commission bill. The amendments give the mayor of New York City the power to name the members of the commission for the first district instead of the governor, provide for the payment of the expenses of this commission by the city and reduce the salary of members of both commissions from $15,000 to $9,000 and of counsel from $10,000 to $7,500. It is also provided that two members of each commission shall be members of the political party receiving the second highest number of votes in the city and state elections; that one member of each commission shall be an experienced railroad workman, and that the terms of all the present commissioners shall expire on January 31, 1909; the governor and mayor are then to appoint each five commissioners for each district, one to serve one year, two to serve two years and two to serve three years. Thereafter, the term of office shall be three years and vacancies shall be filled by appointment for the unexpired term only.

Ohio.—Senator F. C. Howe has introduced in the senate a bill which provides that in case a city and a street railway company cannot agree as to the conditions of a franchise the city may proceed to acquire the tracks or lease them by an appropriation suit. The measure is directed at the Cleveland situation and provides a method of settling the controversy if the present negotiations for a lease of the Cleveland Electric Railway to a holding company are unsuccessful.—Representative Foster has introduced a bill providing that whenever steam railroads and interurban electric roads form a substantially continuous line of railway in the state they shall establish joint rates for passenger and freight traffic.—Representative Wertz has introduced a bill to compel the interchange of passenger and freight traffic by steam and electric roads when the track and equipment of the interurbans are of sufficient strength to accommodate the rolling stock of steam roads.

American Institute of Electrical Engineers.—The Minnesota section of the American Institute of Electrical Engineers will meet at the office of the St. Paul Gas Light Company, Sixth and Jackson streets, St. Paul, on Monday evening, March 16, 1908. Albert H. Armstrong of Schenectady, N. Y., will address the meeting on "Heavy Electric Traction," which will be followed by a general discussion. An informal dinner for members and others at the Ryan hotel will precede the meeting.

New England Street Railway Club.—The annual meeting of the New England Street Railway Club will be held at the Hotel Somerset, Boston, Mass., on the evening of March 26 and the election of officers will take place at that time.

Chicago & Milwaukee Offices Moved.—The general offices of the Chicago & Milwaukee Electric Railroad, Chicago, Ill., have been removed from the Stock Exchange building to the Tacoma building. The operating offices are at Highwood, Ill., and Robert B. Stearns, formerly general manager, is acting as operating manager for the receivers.

Georgia Railway & Electric Employes' Association.—The employes of the Georgia Railway & Electric Company, Atlanta, Ga., have recently organized a benefit association, known as the Georgia Railway & Electric Employes' Association, which has about 500 charter members. The members pay dues of 50 cents a month, or $5.00 a year if paid in advance, and when sick or disabled are entitled to $1.00 a day from the funds of the association, free medicine and free physicians. In case of death by accident or sickness a beneficiary is to receive $100.

Resume Operation of Indianapolis Viaduct.—The Indianapolis Traction & Terminal Company and the Indianapolis Columbus & Southern Traction Company have received permission from the city engineer of Indianapolis to operate light cars over the Virginia avenue viaduct, although the permanent repairs to the structure have not yet been completed. The companies have been obliged to use another route for several weeks because of the condition of the bridge but, according to the city engineer, since about 700 tons of dead weight, such as sidewalks, paving and the concrete base of the roadbed have been removed and it is now considered safe to use the bridge.

Winnebago Traction Company Wins Bridge Case.—The Wisconsin supreme court has decided in favor of the Winnebago Traction Company, of Oshkosh, Wis., a long controversy between that company and the city of Oshkosh and the Eastern Wisconsin Railway & Light Company, of Fond du Lac, Wis., in regard to the latter's right to operate its cars across the Main street bridge into Oshkosh. The decision of the lower court, under which the Eastern Wisconsin Company has been operating across the bridge, is reversed, and the court holds that the only way in which the company may secure the right is by condemnation proceedings or by purchasing the right from the Winnebago Traction Company, which holds the franchise.

Instructing Trainmen on the Illinois Traction System.—In regard to the methods of instruction of trainmen recently put in practice by the Illinois Traction System, C. F. Handshy, general superintendent of transportation, writes: "The practice we are now employing in regard to the examination of trainmen is the same as used by steam roads. We are holding schools of instruction similar to those held by steam roads, taking up the book of rules, timecard and the general method of operation; or, in other words, we are trying to make better men out of our trainmen, that is, get them thoroughly posted on train rules, train orders, etc., and keep them that way. We recently issued a new book of rules, which of course made this absolutely necessary in order that all should get the same understanding. We intend to hold schools of instruction at least once in two weeks at each division point, until such time as we have the men well enough posted so that one session a month will be sufficient, or once in two months."

Increase of Wages in Des Moines.—We are advised by A. G. Maish, general manager of the Des Moines City Railway, that a board of arbitrators representing the company and its motormen and conductors, appointed to adjust the wage scale for the next two years, until March 4, 1910, has decided upon a rate of 19 cents per hour for the first year's service, increasing one cent per hour for each succeeding year's service, including the sixth. The carmen recently demanded an increase of about 40 per cent, while the company felt that the increase was unwarranted and asked for a reduction. The question was then submitted to arbitration. The old scale was 16 cents per hour for the first year's service, increasing to 23 cents for the ninth year and thereafter. A controversy as to the wages of the carmen employed by the Inter-Urban Railway of Des Moines was settled on Saturday night, when the men voted to accept President Polk's offer of the same scale that was granted the city men. The men had demanded a higher rate than that paid the city men, but accepted the same rate in view of certain concessions, including pay for deadhead time and three cents per hour additional for overtime.

Traffic and Transportation

Through Routes on Chicago Elevated Roads.

Clarence A. Knight, president of the Chicago & Oak Park Elevated Railroad, has written a letter to Alderman M. G. Foreman, chairman Chicago council committee on "Local Transportation," in which he signifies the willingness of that company to put into effect a system of universal transfers in connection with the other elevated roads, under an arrangement satisfactory to all interests. Mr. Knight states that if through routing cannot be brought about he is in favor of eliminating several stations and of elevating the north track of the loop on Lake street from La Salle street to the west track on Fifth avenue and the west track on Fifth avenue from Lake street to Washington street. Mr. Knight would also extend the platforms of the loop stations. Before committing the company to any of these propositions, however, Mr. Knight desires that some disposition be made of several matters that have been pending before the committee for three years, including an ordinance granting the company the right to elevate its tracks from Fifty-second avenue to Austin avenue.

H. G. Hetzler, president of the Metropolitan West Side Elevated Railway, does not favor the plan for the through routing of trains on the Chicago elevated roads or the plan for running the Metropolitan cars from the Humboldt park and Logan square branches to the loop over the Lake street road.

Withdrawal of Commutation Tickets by Schenectady Railway.

The Schenectady (N. Y.) Railway has filed its answer with the New York public service commission, second district, in relation to the complaint of residents of Albany, Troy, Schenectady, Green Island and Watervliet, as to withdrawal of the sale and use of commutation tickets since January 1. The company denies that the withdrawal of such tickets was unreasonable. It denies the statements contained in the complaint as to dividends declared and paid by the company. In connection with such denial the company states that since the present owners of the stock of the company acquired the same and assumed the management of the company but one dividend has been paid and that was a dividend of 1¼ per cent, payable on July 30, 1906. No other dividend has been paid, for the reason that the earnings are not sufficient to justify a dividend.

The company denies that it is the policy of the management to curtail the service without consideration of the convenience of the traveling public, but on the contrary alleges that the management has arranged its service with as little inconvenience to the traveling public as is possible. With the object in view of increasing its revenue and decreasing its expense, the management found it necessary to adopt such a policy that the earnings might fairly be expected to be increased or the expenses of operation reduced to the end that some reasonable degree of profit might be left to afford some return on the investment. It has been found impossible to reduce expenses of operation, as an increase of wages of 20 per cent has been necessary, and costs have increased in every department concerned with the operation and maintenance of the road. Without material deduction in wages some increase must be obtained by way of revenue to enable the present management to maintain the road and its operation and produce any return upon the investment. Such increase, the present management believes, will be in part obtained by the withdrawal of the commutation tickets.

The company further states that the use of commutation tickets was adopted by the General Electric Company when it was the owner of the Schenectady Railway, and as the present management is advised, this arrangement was not a railroad, but an industrial feature. At that time it was impossible for that company to find living accommodations for its workmen in Schenectady, and it was necessary therefore for that company, also owning the railway, to make rates of transportation to and from points outside of Schenectady so low that its employes might live in such outside localities to be carried on the railway from and to their homes. Since these commutation rates were put in effect the conditions have changed. Schenectady has grown, the needs of employes to go outside the city to live have become less, and the result now claimed is that the rates so adopted are so low that they produce no adequate return for the service.

The company further states that the traffic for which commutation rates were adopted cannot be cheaply carried, for the reason that in the hours in which commuters ride the cars have few passengers, as in the morning hours the tide of travel is toward Schenectady, and in the late afternoon hours is from that place. The company contends that the rates now charged are fully as low or lower than those which prevail on other electric lines fairly to be compared with the Schenectady Railway. The company requests that the complaint be dismissed

Petition for Reduced Fares in Springfield, Mass., Denied by State Commission.

The Massachusetts railroad commission has dismissed the petition asking that the Springfield Street Railway be compelled to sell six tickets for 25 cents, and 25 tickets for $1.00. In its decision the commission states:

"The board has given a hearing upon this petition, the grounds of complaint being that the rates of fare are excessive and that the company does not furnish a sufficient number of cars to accommodate the public.

"The case does not present the question of extension of privileges to a rapidly growing suburban community or to outlying suburbs in process of development. No convincing evidence has been presented in support of the contention that a reduction in the rate of fare will result in a considerable increase of revenue from present patrons or from persons not now using the road, and we believe it would be unfair to ask the company to test by a trial the soundness of the petitioners' argument. A company might adopt experimental measures in the management of its business which the board could not properly recommend in the exercise of its supervisory powers.

"The complaints as to insufficient number of cars related in large measure to the so-called rush hours of the afternoon, and unsatisfactory conditions were particularly alleged in connection with the Wilbraham road, Belmont avenue, Maple street, Liberty street, Chicopee by way of Glenwood, and Chicopee Falls by way of Brightwood, and Chicopee lines. Subsequent to the hearing careful observations were made on five days and the board is convinced from both the evidence and the reports of these investigations that improvement is being made and that the company is endeavoring to give to Springfield citizens the first-class service to which they are entitled, but this endeavor is hampered by existing track conditions. Many of the delays of which complaint was made were caused through single-track operation. It appears that the company has now pending before the authorities of Springfield applications for double-track locations upon which no action has been taken. It would obviously be improper for the board, in view of its statutory duties as to approval of location grants, to make any suggestion relative thereto, but it is its conviction that the only remedy for much of the inadequacy of accommodation is additional trackage, and we, therefore, so far as we may with propriety do so, urge the petitioners and company to give attention to this phase of the situation."

"The rule of construction in instruments of this character, where an ambiguity exists, is as follows: 'If any ambiguity exists in a grant of privilege, it must operate against the grantee in favor of the public.'"

Decision in Long Island Fare Case.

The decision of the New York Public Service Commission, Second District, requiring the New York & Long Island Traction Company, Hempstead, N. Y., to charge not to exceed five cents fare for a continuous trip of five miles or less over any portion of its lines as described in its articles of association, is by Chairman Stevens. An abstract of the decision follows:

"The respondent was incorporated in 1899, under the name Mineola Hempstead & Freeport Traction Company. This name was changed in 1902, to the New York & Long Island Traction Company. The fourth of its articles of association, reads as follows: 'Such road shall be * * * operated from points in the village of Mineola to points in the village of Freeport, all within the county of Nassau, which points shall be its terminal; and its length shall be 11 miles.' It appears that the greater portion of the route thus described is situate within the town of Hempstead, and beginning in the northerly line of that town runs south through the villages of Hempstead and Freeport. The distance from the northerly line of the town of Hempstead to the northerly line of the village of Hempstead is less than five miles, and the distance from the southerly line of the village of Hempstead, to the northerly line of the village of Freeport, is less than five miles. There also appears to be a portion of the line in the town of Hempstead south of the southerly line of the village of Freeport, which is less than five miles in length.

"On June 6, 1901, the highway commissioners of the town of Hempstead granted a consent for the construction of the road, describing three different places therein where it might be constructed. The question arises upon the proper construction of provisions in the franchise. After granting the right of way, the resolution makes certain conditions, one clause providing that the Mineola Hempstead & Freeport Traction Com-

pany shall make not less than six round trips daily over the entire track laid by it, and that the maximum rate for one continuous passage in either direction over the entire line as herein described shall not exceed 10 cents and shall not exceed 5 cents for any five miles or less, and that the traction company shall issue to and receive from any connecting line or lines, now or hereafter to be built, upon payment of one fare therefor transfer checks or tickets, the fare paid to be divided between the connecting companies in proportion to the distance traveled by the passenger, and that in no case should the proportion charged by the traction company exceed 10 cents for passage over its entire road, as herein described, and it shall not exceed five cents for any five miles or less.

"The respondent charges 10 cents fare from a point in the village of Freeport to a point in the village of Hempstead, which points are less than five miles apart. It claims that the condition in its franchise just quoted does not relate to those portions of its line situate within the villages of Hempstead and Freeport, and is applicable only to those portions of its line situate in the township of Hempstead outside of the limits of the two villages. The complainant urges that the condition is applicable to the entire line.

"The language of the franchise is ambiguous to some extent. In the franchise there is no specific description of the entire line, while, on the other hand, there is a specific description of those portions of the line which lie wholly within the town of Hempstead and outside of the villages of Hempstead and Freeport. The respondent claims, therefore, that the language quoted relates only to those portions of the line which are specifically described in the grant. The question is whether the highway commissioners intended to restrict the amount of fare to those portions of the line situate exclusively within the town of Hempstead, or to restrict it upon the entire line. The requirement that the respondent shall make not less than six round trips daily over the entire track laid by it shows that the commissioners had the entire track, covering a distance of 11 miles, in mind. This provision is then followed by the agreement that the maximum rate for one continuous passage in either direction over the entire line as herein described shall not exceed 10 cents. There could not be a continuous passage in either direction over the three distinct parcels situate within the town of Hempstead. The words 'entire line as herein described,' are not aptly chosen in view of the drafting of the remainder of the grant, but they cannot have any proper effect unless they refer to the words 'entire track' in the previous sentence and also to the line as described in the articles of association of the respondent. The next words used, 'And shall not exceed 5 cents for any five miles or less' clearly contemplates a continuous trip of five miles which was not physically possible within the town of Hempstead. It is very clear that the commissioners intended to cover by this language the entire length of the road. An ambiguity in the language may be conceded to exist, and the question then becomes whether or not they succeeded in embracing within the grant the intention which we hold they had.

Theater Car on Illinois Traction System.—A special theater car was run to Springfield, Ill., over the St. Louis branch of the Illinois Traction System on March 8.

Additional Service on Long Island.—The Long Island Railroad has announced that a new schedule will be placed in force on May 28, giving additional service to many parts of Long island.

Service Improved in Savannah, Ga.—Under a plan of making stops, introduced by the Savannah (Ga.) Electric Company, officials report that the service is rapidly improving. The regular stops now in effect enable trains to maintain much better schedules.

Owl Car Service in Toledo.—The Toledo (O.) Railways & Light Company has established owl car service. H. S. Swift, secretary and auditor of the company, announced that the total number of passengers carried on the first night was 282 and the total receipts were $14.10. Five cars were operated.

Parlor Car Service on the Puget Sound.—The parlor car service established by the Puget Sound Electric Railway between Tacoma and Seattle has been so successful that additional cars will be introduced to meet the demand. At present two parlor cars are in service, and an additional charge of 25 cents is made for a seat therein.

The Near or the Far Side of the Street in St. Paul.—At a conference between the fire board, officials of the Twin City Rapid Transit Company and a committee of the city council in St. Paul on March 4, an agreement was reached regarding the stops. The company agreed to restore the old system of stopping on the far side of the street at practically all crossings and the fire board agreed to the elimination of the stops on the near side of Cedar street. The board insisted that the cars stop before crossing streets where firemen make runs, but agreed that the runs on Cedar street should be abolished. This concession will eliminate stops at three points where streets on which cars run intersect with Cedar street. The arrangement is subject to approval by the city council.

Georgia Hearing Concluded.—The hearing on the application before the Georgia railroad commission for reduction in the fare between Atlanta and Marietta from 35 to 20 cents, was concluded at Atlanta on March 5. P. S. Arkwright, president of the Georgia Railway & Electric Company, admitted that the stock in the Atlanta Northern Railway is owned by the Georgia Railway & Electric Company.

Order Regarding Transfers in Schenectady, N. Y.—The Schenectady (N. Y.) Railway Company has issued orders to conductors to give no transfers from one line to another, except at the transfer points printed on the back of transfers. The transfers will not be accepted by conductors except when people board cars at the proper points. This order has been issued to protect the company from many abuses of the transfer privilege.

Count Cars and Passengers on Brooklyn Bridge.—Inspectors of the bridge department of New York City were stationed on the Brooklyn bridge during the evening rush hours on February 17 to count the cars and passengers. The inspectors found that on the surface lines, between 4 and 7 o'clock, there were 328 cars per hour, or 26 cars more than on October 17 last, when the elevated bridge service was in operation and the subway not in use. During the three hours these cars carried 9,839 passengers. The elevated roads had during the same hours 1,026 cars and 59,994 passengers, against 700 cars and 57,007 passengers on October 17, 1907.

Fare Reduction to be Contested in Oregon.—The Oregon Water Power & Railway Company, Portland, Ore., which is operated by the Portland Railway Light & Power Company, will contest in court the order of the Oregon railroad commission that the company reduce fares between Oak Grove and Milwaukie and Portland, and also extend transfers to Lents. In referring to the proceedings which have been started Ralph W. Wilbur, attorney for the company, said that when the railroad commission decided against the company it was decided to bring the case before the courts, for the reason that fares charged by competitors exceed the 5-cent rate. The company contends that it should not be compelled to carry passengers at a lower fare than other companies are permitted to charge.

Changes in San Francisco.—Charles N. Black, vice-president and general manager of the United Railroads of San Francisco, has made public a statement in relation to reports concerning changes in the force of inspectors and extra conductors and the curtailment of the transfer system. Mr. Black states that it is not the intention of the company to curtail any privileges or to hamper the service; and, while the force of inspectors has been reduced materially, he calls attention to the fact that prior to the fire, when the traffic was much larger than it is at present, the company employed 25 inspectors, and that number has been found ample to perform all the duties now required of such employes. Mr. Black adds that the transfer system has not been curtailed in any particular, but that during the last three months transfer privileges have been increased materially. The only restrictions are those which have become necessary to avoid deliberate misuse of transfer privileges. The changes simplify the system and avoid disputes between passengers and conductors.

In reply to a request of the New York public service commission of the first district, President Mellen of the New York New Haven & Hartford Railroad on March 6 sent a letter explaining that the construction of an electric line between New York and Port Chester is being delayed by litigation. The New Haven owns two franchises, one for the New York Westchester & Boston Railway and one for the New York & Port Chester Railroad. The validity of the Westchester franchise has been questioned and the company has been unable to acquire the necessary right of way by condemnation proceedings. The route of the Port Chester franchise was changed to coincide with that of the Westchester company, but construction has been blocked by an injunction. Mr. Mellen assured the comission that as soon as the legal difficulties are settled the New Haven company would proceed to build the line.

The Gaceta de Madrid of February 7 announces that the Compania del Ferrocarril de Sarria at Barcelona, Spain, has applied for a concession for an electric tramway in Barcelona, and that a period of one month from the date of publication has been appointed for the presentation of proposals.

Construction News

FRANCHISES.

Bridgeport, Ala.—A franchise has been granted to C. A Sutliff and associates of South Pittsburg, Tenn., for the construction of an electric railway in Bridgeport, which it is stated will form part of an interurban line to be built from Bridgeport to Copenhagen, Richards City, South Pittsburg and Jasper, Tenn.

Brownsville, Tex.—S. K. Hallam, L. H. Hallam, John G. Fernandez and A. C. Brokaw, all of Brownsville, Tex., have applied for a franchise to build a street railway in this city.

Chicago, Ill.—The ordinance extending the franchises of the South Chicago City Railway and the Calumet Electric Street Railway and providing for a consolidation of the companies under the name of the Calumet & South Chicago Railway, was considered at a public meeting of the local transportation committee of the city council on March 3, and was practically completed on March 6. Representatives of residents of the districts affected appeared to suggest numerous changes in the ordinance. The ordinance extends the date of expiration of the present franchises from 1912 and 1915 to 1928, and requires a division of the net receipts with the city, the latter receiving 55 per cent as in the Chicago City Railway and Chicago Railways Company franchises. The ordinance also provides for four transfer zones. In the first zone transfers are to be exchanged with the Chicago City Railway. In the second zone transfers are to be exchanged after a year, provided the company earns 6¼ per cent on its investment. Bion J. Arnold and George Weston are now making a valuation of the property. The ordinance provides for a thorough rehabilitation of the properties within 3½ years, 40 miles of track to be rebuilt at once. The company is required to provide 15 new cars within the first year and as many thereafter as may be specified by the board of supervising engineers. Seven important extensions are to be built by January 1, 1910.

Dallas, Tex.—The city council has passed an ordinance granting a franchise to the Texas Traction Company for an entrance to the city. The route lies mostly over the tracks of the Dallas Consolidated Electric Street Railway and the Metropolitan Street Railway but the company will build some new track of its own. The line from Sherman to Dallas, 65 miles, is expected to be ready for operation about June 1.

Evans, Colo.—The city council has granted a franchise to the Greeley & Northern Colorado Railway & Utility Company for the construction of an electric railway in Evans, Colo. It is stated that 20 acres of land will be donated by the city for car repair shops and barns, to be located about two blocks west of the Union Pacific depot. It is also reported that a portion of the right of way through the western part of the city will be donated to the company.

North Yakima, Wash.—The Yakima Valley Transportation Company has applied for an extension of one year in which to complete the first five miles of track. Under the terms of the franchise, the company should have had this amount of tracklaying completed by March 12, but owing to delays only three miles had been laid. Five miles must be laid each year hereafter. (Noted January 4.)

Seattle, Wash.—A franchise has been granted by the county commissioners to F. X. Waldron & Co. of this city for the construction of an electric railway and light system on Vashon island. The road will be 12½ miles long and will pass from the north to the south end of the island, by way of Burton. Final surveys have been completed and it is stated that grading will be started at once and the work pushed in order to have the line completed by June 1, 1909, the date of the opening of the Alaska-Yukon-Pacific exposition. The plans include two fast ferry boats, one running to the north end of the island from Seattle and the other to the south end from Tacoma, Wash. It is stated that the power house and electric light plant will be located at Lisabeula. The franchise states that the line must be started within 90 days from the date of the grant, be completed as far as Burton within two years and be entirely completed within five years. (Noted February 22.)

RECENT INCORPORATIONS.

Catoctin & Pen-Mar Railway.—A bill has been introduced in the Maryland legislature at Annapolis to charter this company to build a railroad from Myersville to Pen-Mar, Md., the line to be operated either by steam or electricity. Capital stock, $50,000, which may be increased to $500,000. Incorporators: Henry M. Warrenfeltz, Hubert L. Hanover, Dr. Alvey J. Smith, C. Upton Grossnickle, George R. Stottlemeyer, Michael Kline, C. W. Blickenstopp, J. David English, Gideon O. Horne, I. A. Fox, Worth B. Stottlemeyer and J. W. Brown.

Kansas City & Kansas Southwestern Electric Railway.—This company has applied for a charter to build an electric railway in Kansas connecting Topeka, Kansas City and Independence, Kan. Capital stock, $10,000,000. E. M. Lamkin, Kansas City; J. E. Martin and C. S. Dudley, Minneapolis, Minn.; W. L. Moyer, New York City; W. Laming, Tonganoxie, Kan.; S. W. Brewster, Chanute, Kan.; and Harry E. Hopper, Indianola, are interested.

Montgomery Electrical Company, Christiansburg, Va.—Incorporated in Virginia to build an electric railway from Christiansburg to Cambria, Va. Capital stock, $5,000, which may be increased to $50,000. J. L. Vaughan, Shawsville, Va., president; E. S. Hagan, vice-president; A. A. Palegar, Jr., secretary and treasurer, Christiansburg, Va.

Thief River Electric Railway, Thief River Falls, Minn.—Incorporated in Minnesota to build an electric railway from Thief River Falls northeast into Beltrami county. It is stated that $50,000 has been subscribed and a part of the right of way donated. D. N. Winton, president; D. P. O'Neill, first vice-president; Milton Forder, second vice-president; M. V. Everson, third vice-president; T. P. Hamre, secretary; L. M. Hoag, treasurer; G. Halvorsen, counsel.

Washington & Maryland Electric Railway.—A bill has been introduced in the Maryland senate by Senator Clagett of Prince George county, incorporating this company, which proposes to build and operate an electric railway from Washington, D. C., to Ritchie Station, Prince George county, where it will connect with the Chesapeake Beach (steam) Railway. Horace Crosier, commissioner of Prince George county; Samuel E. Cox, T. Van Clagett, George S. Dove, F. Snowden Hill, George Zerhorst, Albert S. Carry, Alfred G. Shaw and Ernst Gerstenberg are named as incorporators.

TRACK AND ROADWAY.

Annapolis, Md.—Senator Lee of Montgomery county, Maryland, has introduced a bill in the senate providing for the construction of a 5-mile electric railway which will afford direct connection between Damascus and Mt. Airy, Md.

Atlanta & Carolina Railway, Atlanta, Ga.—This company which proposes to build an electric railway from Atlanta to Augusta, Ga., has filed amended articles of incorporation which provides for extensions into the following counties not included in the original charter: Newton, Columbia, Richmond, Lincoln, Walton, Oconee, Clarke, Oglethorpe, Wilkes and McDuffie. James W. English, president. (Noted March 7.)

Augusta & Columbia Railway, Augusta, Ga.—It is announced that this company, which was organized about a year ago to build an extension of the Augusta & Aiken Railway from Aiken to Columbia, S. C., 59 miles, will start construction work in the near future. It is proposed to connect with the Augusta & Atlanta Electric Railway, on which construction will soon be started between Atlanta and Augusta, and will afford a through trolley route from Atlanta, Ga., to Columbia, S. C. James U. Jackson, Augusta, Ga., is interested. (Noted April 20, 1907.)

Bartlesville (Okla.) Interurban Railway.—W. G. Thummel, chief engineer, writes that a contract has been let to the Freeborn Engineering & Construction Company of Kansas City for the overhead construction, tracklaying and installation of power house machinery for the line between Bartletsville and Dewey, Okla., seven miles. The power house equipment, including generators, engines, pumps and boilers, was purchased on March 6 from the John A. Stewart Electric Company of Cincinnati, O. Rails, spikes, etc., were also purchased from the St. Louis Rail & Equipment Company. The road is to be in operation by June 15. J. J. Curl is president. (Noted December 14, 1907.)

British Columbia Electric Railway, Vancouver, B. C.—During the year 1907 this company constructed about 9½ miles of single-track extensions in Vancouver, Victoria and Westminster, B. C., and several miles of track were laid with 60-pound rails, in place of 40-pound rails in Vancouver, and with 56-pound rails in Victoria. Among the extensions outlined for this year are the Westminster-Chilliwack line, about 56 miles, and other extensions aggregating about 80 miles. The work is to be done by the company. R. H. Sperling, Vancouver, is general manager.

Buffalo Lockport & Rochester Railway, Niagara Falls, N. Y.—The Rochester-Albion section of this line from Rochester to Lockport, N. Y., is now expected to be in operation by

May 1 and the Albion-Lockport section by July 1. Tracklaying on the latter section has been completed to a point just east of Lockport and the remainder will be finished as soon as the weather permits. Power will be received from the Niagara Lockport & Ontario Power Company. J. G. White & Co. are the contractors. Edmund Wragge, chief engineer, Toronto, Ont. (Noted August 31, 1907.)

Charleston & Summerville Electric Railway, Charleston, S. C.—It is stated that grading will soon be resumed on the remaining four miles of this 27-mile interurban line which will connect Charleston and Summerville, S. C. George Tupper, secretary and treasurer, Summerville, S. C. (Noted January 4.)

Chicago Railways Company.—A permit has been secured from the city superintendent of streets for the reconstruction of the tracks on North Clark street, from Washington street to Addison avenue, and in Milwaukee avenue between Desplaines and Robey streets. The tracks will be relaid with 129-pound grooved rails. Work is to begin about March 25.

Connecticut Company, New Haven, Conn.—Plans for an electric railway from Willimantic to South Coventry, Conn., have been submitted to the board of aldermen of Willimantic.—A hearing was held before the state railroad commission on March 9 on the proposed line from Waterbury to Woodbury. No opposition developed.

Eastern Pennsylvania Railway Company, Pottsville, Pa.—This company has completed an 8-mile link between Tamaqua and Middleport, Pa., completing a through line from Pottsville to Mauch Chunk.

Eastern Railway Construction Company.—This company was formed at a recent meeting of stockholders of the West Chester & Wilmington Electric Railway, with a capital stock of $10,000 to build its proposed electric railway from West Chester, Pa., to Wilmington, Del. The West Chester & Wilmington company holds charters for operating in both Pennsylvania and Delaware and steps for merging the two companies have been taken.

Evansville (Ind.) Railways Company.—C. H. Battin, general manager, writes that a new line will be built this year from Evansville to Newburg, Ind., nine miles, for both steam and electric operation. The line will be built under the name of the Evansville Terminal Railway.

Des Moines (Ia.) City Railway.—George B. Hippee, president, writes that this company does not propose to make any extensions or improvements this year.

Des Moines Winterset & Creston Electric Railway, Des Moines, Ia.—E. B. Steere, general manager, writes that surveys have been completed for the proposed line from Des Moines to Creston, Ia., 64 miles. Construction is to begin as soon as financial arrangements are completed. The company has a 25-year contract with the Inter-Urban Railway and the Des Moines City Railway for terminal facilities in Des Moines and will use 5.7 miles of those companies' tracks from Valley Junction to a loop in the city. It has also made arrangements for freight terminals in Des Moines and has favorable franchises in Winterset, Macksburg and Creston, the latter being exclusive for 25 years. The line will be entirely on private right of way, 100 feet wide, over 80 per cent of which is now owned or contracted for. It is planned to erect a power plant and to sell current for lighting and power. The estimated cost of construction is $1,815,583. W. D. Skinner is president and B. Schreiner is chief engineer. (Noted February 22.)

Dunnville Wellandport & Beamsville Electric Railway, Dunnville, Ont.—We are advised by James A. Ross, president, that this company expects to start construction work on its 16-mile electric line from Dunnville to St. Ann's during the coming summer. The preliminary surveys have been completed and plans and estimates are being made. President, James A. Ross, Wellandport, Ont.; vice-president, F. R. Lalor, M. P., Dunnville; secretary, W. J. Aikens, Dunnville. F. J. Ramsey, M. L. Parry, R. A. Harrison, George R. Smith, Thomas Marshall and E. L. Edgecomb, all of Dunnville, Ont., are the directors. (Noted March 7.)

Ft. Wayne & Springfield Railway, Decatur, Ind.—This company has filed notice of an increase of capital stock from $500,000 to $1,000,000 for the purpose of building an extension from Decatur to Richmond, Ind., and an organization of representatives from various towns along the proposed route has been formed to co-operate with the company to secure the line.

Hanford (Wash.) Electric Railroad.—It is reported that construction on the proposed electric line from Hanford to Kennewick, Wash., will be started at once. The line will be built by the Hanford Irrigation Company and it is stated that materials have been purchased.

Grand Haven, Mich.—It is reported that E. J. H. Stonemetz contemplates building a new street railway in Grand Haven and taking over the city lighting plant.

Illinois Traction System, Champaign, Ill.—Plans are now being considered for the construction of the line between Peoria and Streator, Ill., which will form a part of the proposed through line to Chicago, via Yorkville or Joliet.

Jacksonville, Tex.—H. L. Norton of Boston, Mass., is in Jacksonville endeavoring to interest the citizens of this and other towns in a proposed interurban electric line 75 miles long, which will connect Jacksonville, Dialville, Rusk and Tyler, Tex. The road will be built primarily for handling the truck and fruit trade in this section. Mass meetings are being held in the towns along the route.

Louisville (Ky.) Railway.—This company proposes to authorize an issue of $1,000,000 preferred stock to provide for improvements to its power station and for the extension of its Bardstown line. It is intended also to build an extension to the state fair grounds. T. J. Minary, president and general manager, Louisville, Ky.

Memphis Covington & Northern Railroad, Covington, Tenn.—R. W. Sanford, attorney, writes that this company has completed surveys for its proposed interurban electric line, which will connect Memphis and Covington, Tenn., 40 miles. The plans of the company have not been fully decided upon, but Mr. Sanford states that construction work may be started this summer. J. B. Gillespie, president, Covington, Tenn.; J. B. Witherington, vice-president; John T. Garner, secretary and treasurer; R. W. Sanford, attorney. W. K. Palmer Company, 718 Dwight building, Kansas City, Mo., chief engineer. (Noted November 16, 1907.)

Metaline Rapid Transit Company, Seattle, Wash.—This company has recently been organized by John S. Cosford, W. W. Warner and H. J. Warner of Seattle.

Mexico Santa Fe & Perry Traction Company, Mexico, Mo.—It is reported that grading, for which contracts were awarded last fall, will soon be resumed on this proposed line between Mexico and Perry, Mo., by way of Molino and Santa Fe. Three miles had been completed when work was suspended in the winter. It is stated that contracts for roadbed construction and equipment will be let in the near future. The line will be 27 miles long and gas-electric cars will be operated. S. L. Robinson, president and general manager, Mexico, Mo. (Noted February 15.)

Montgomery (Ala.) Traction Company.—Announcement is made that this company expects to spend $100,000 for improvements.

Ohio Electric Railway, Cincinnati, O.—Tracklaying on the Lima-Bellefontaine line has been completed from Waynesfield to Huntsville, O. It is stated that within 60 days this portion of the line will be ready for the overhead construction and that it will be in operation some time in May.

Omaha & Council Bluffs Street Railway, Omaha, Neb.—Work has been started on the new Twenty-fourth street line of this company from Leavenworth street to Cass street and as soon as Twenty-fourth street has been opened from Cass street to Cuming street work will be pushed to an early completion of the line. W. A. Smith, general manager, Omaha, Neb.

Pacific Electric Railway, Los Angeles, Cal.—This company has recently secured trackage rights over the Crescent City Railway from Riverside to the plant of the Southern California Portland Cement Company, a distance of five miles, which it is understood will be used in connection with a proposed line from Riverside to Los Angeles.

Pittsburg Lisbon & Western Railroad, Lisbon, O.—N. B. Billingsley, president, writes that the report that this company contemplates electrifying a portion of its line and building an extension from Darlington to Morado, Pa., is entirely erroneous, as no such plans have been considered.

Seattle Electric Company, Seattle, Wash.—This company is reported to be planning improvements to its lines and equipment during the coming year at an approximate cost of $1,500,000. It is stated that a number of miles of new track will be built to care for the traffic during the Alaska-Yukon exposition in 1909. H. F. Grant, manager, Seattle, Wash.

San Francisco Oakland & San Jose Consolidated Railway.—This corporation has been formed with a capital stock of $7,750,000 for the purpose of consolidating the San Francisco Oakland & San Jose Railway and the San Francisco & Bay Counties Railway, the latter having been recently incorporated

to build an electric railway from San Francisco to San Jose. The company proposes to continue the operation of the three lines at present operated by the San Francisco Oakland & San Jose, to construct a line from San Francisco to San Jose, to build a branch line to Northbrae and another branch to Claremont, and to connect the main line with Yerba island by means of a tunnel. The directors are: F. M. Smith, F. C. Havens, E. A. Heron, H. Wadsworth and Dennis Searles, of San Francisco.

Shore Line Electric Railway.—Considerable progress has been made on grading for this proposed electric railway and it is stated that the line may be opened for traffic during the coming summer. The company was formed last spring to build a 13-mile electric line from Horse Neck Beach to R. I., and others are interested. (Noted November 9, 1907.)

Terre Haute Indianapolis & Eastern Traction Company, Indianapolis, Ind.—Construction is progressing rapidly on the line between Amo and Danville, Ind. When this line is completed there will be two possible routes for the Terre Haute-Indianapolis service, one via Amo and Plainfield, as at present, and the other via Amo and Danville.

Texas Traction Company, Dallas, Tex.—Rapid progress is reported on the construction of this 65-mile interurban line from Dallas to Sherman, Tex. About 30 miles of track have been laid from McKinney to a point north of Howe, and it is expected that it will be entirely completed to Sherman within about 10 days. A construction force also is at work south of McKinney and it is expected that the road will be equipped and ready for operation by summer. Theodore Stebbins, general manager, Dallas, Tex. (Noted January 11.)

Twin City Rapid Transit Company, Minneapolis, Minn.—George L. Wilson, engineer and roadmaster, writes that no extensions are contemplated this year.

Utah Light & Railway Company, Salt Lake City, Utah.—It is announced that this company will build its proposed Ninth avenue electric line during 1908. The new line will follow the present Sixth avenue line for a part of the distance and will then branch off on Ninth avenue, serving a new section of the city which is being rapidly built up. Joseph S. Wells, general manager, Salt Lake City. (Noted West Point, Mass., and into Connecticut from Saybrook to Ivorytown and Essex. Charles F. Parkherm, Woonsocket, November 23, 1907.)

POWER HOUSES AND SUBSTATIONS.

Ohio Electric Railway, Cincinnati, O.—This company is installing a substation at Jewell, O., on the Springfield-Bellefontaine line.

Seattle Electric Company, Seattle, Wash.—It is stated that this company will enlarge its power plant at Georgetown, Wash., during the coming year.

Athens (Ga.) Electric Railway.—This company has ordered from the Allis-Chalmers Company for installation in its power house at Athens a 1,000-kilowatt steam turbine, together with a direct-connected three-phase 60-cycle 2,300-volt generator and a 40-kilowatt induction motor-generator set.

New York City Railway.—This company is remodeling one of its buildings at Houston street and Broadway, to be used as a substation. Nearly all of the machinery has been installed, including two 1,500-kilowatt rotaries, six transformers and the necessary switchboards and other apparatus, all of General Electric manufacture. It is expected that this will be put in operation during the next two weeks.

Louisville (Ky.) Railway.—This company will increase the capacity of its Jacob street power station by the addition of a 3,000-kilowatt turbo-generator unit. T. J. Minary, president and general manager, Louisville.

Americus (Ga.) Railway & Light Company.—Contracts for power house equipment for the Americus street railway line have been awarded as follows: Westinghouse Electric & Manufacturing Company, electrical equipment in duplicate, including two steam turbines, with turbo-generators of 550 horsepower and actual speed of 3,600 revolutions per minute; Wheeler Condenser & Engineering Company, Carteret, N. J., condensing apparatus; Casey & Hedges Company, Chattanooga, Tenn., boilers in duplicate, each of 500 horsepower and equipped with superheaters; Henry R. Worthington, New York, pumps, including two boiler feed, one centrifugal and one triplex pump, operated by 100-horsepower motor; General Electric Company, equipment for street-lighting system; Standard Brick Company, Macon, Ga., 300,000 brick for construction of power house; building to be of brick, fireproof, steel smokestack, 150 feet high and resting on base of brick and concrete. R. N. Waller, president. (Noted January 4.)

Personal Mention

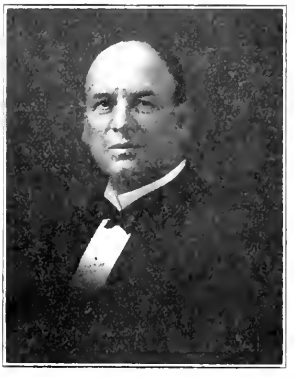
Mr. Charles B. Houck has been appointed general manager of the Wilkesbarre & Hazleton Railroad Company, with headquarters at Hazleton, Pa.

Mr. F. A. Wilkinson, assistant superintendent of tracks of the Worcester (Mass.) Consolidated Street Railway, has been appointed superintendent of tracks, succeeding Mr. Rockwood H. Bullock, resigned.

Mr. D. W. Cameron, formerly general manager of the Cambridge Power Light & Traction Company, Cambridge, O., has resigned. He will be succeeded by Mr. J. A. Middleswart, secretary of the company.

Mr. H. B. Twyford, who went from Chicago to London about five years ago to become purchasing agent for the Underground Electric Railways, London, Eng., has resigned and returned to the United States.

Mr. William Busby, whose portrait is presented herewith, was recently elected president of the Choctaw Railway & Lighting Company of McAlester, Okla., succeeding Mr. A. W. Underwood of Chicago, having acquired control of the property. Mr. Busby was born 53 years ago in Pemberton, N. J., and later moved to Kansas. In 1895 he became general agent of the coal department of the Choctaw Oklahoma & Gulf Railroad, and after six years with that company engaged in the coal business for himself. He now owns two large coal mines and his principal interests are in that business, although he has been prominently identified with the industrial development of Oklahoma in several other directions. He also controls the McAlester Brick Company and operates the Wilburton Water & Power Company.



William Busby.

Mr. A. H. Walcott, heretofore superintendent of the Blue Hill Street Railway, Canton, Mass., has resigned; effective on February 19. He will be succeeded by Mr. F. T. Buchanan, as announced in our issue of last week.

Mr. Charles L. Rogers, superintendent of the Uxbridge & Blackstone Street Railway at Uxbridge, Mass., has been appointed superintendent of the Milford Attleboro & Woonsocket Street Railway, succeeding Mr. E. A. Potter, resigned.

Mr. W. C. Crawford of Tilbury, Ont., has been elected first vice-president of the Windsor Essex & Lake Shore Rapid Railway of Windsor, Ont., and Mr. C. Magee of Ottawa, Ont., has been elected second vice-president. Mr. W. R. Phillimore of Chatham, Ont., has been elected treasurer to succeed Mr. Crawford.

Mr. R. W. King, who succeeded Mr. Joseph Colvin as superintendent of the Washington Alexandria & Mt. Vernon Railway, Washington, D. C., as announced in the Electric Railway Review of February 22, has been appointed general manager of the company, effective on March 4. Mr. P. E. Clift, who has been assistant superintendent and master mechanic of the company for a number of years, has been made superintendent, succeeding Mr. Colvin.

Mr. R. W. Shepherd has been appointed auditor of the Portland Railway Light & Power Company, with headquarters at Portland, Ore., a position which recently was created by the retirement of Mr. Samuel G. Reed, treasurer, and the consolidation of the offices of secretary and treasurer of the company under Mr. Charles M. Huggins, formerly treasurer and auditor. Mr. Shepherd was connected for many years with the United Gas Improvement Company of Philadelphia and more recently was auditor and assistant comptroller of the Rhode Island Company at Providence, R. I.

With the recent retirement of Mr. S. W. Huff as general manager of the Virginia Passenger & Power Company, Richmond, Va., that office has been abolished and the following changes have become effective: Mr. C. B. Buchanan, heretofore superintendent of transportation, has been appointed general superintendent of railways. Mr. George H. Whitfield, mechanical and electrical engineer, has been appointed general superintendent of light and power and will have charge of the power houses, substations and power equipment.

Mr. Thomas Millen, who recently resigned as master mechanic of the New York City Railway, has been in active railroad service for 42 years, principally with steam railroads. In 1894 he was appointed master mechanic of the Metropolitan Street Railway of New York, now operated by the New York City Railway, and held that position until a few days ago, when he retired from railroad service to live on his farm at Sussex, N. J. Mr. Millen was tendered a complimentary banquet on his retirement by his railroad friends and associates, at Shanley's, New York City, at which a large number of prominent railway men were present. Mr. A. C. Tully was toastmaster.

Mr. E. E. Downs, who has been appointed general manager of the Sterling Dixon & Eastern Electric Railway at Dixon, Ill., has had an extensive experience in the construction and operation of electric railways. Mr. Downs was born in Boston, Mass., and his first business experience was in general contracting and telephone work. When the electrification of street railways began he became connected with the construction department of the Thomson-Houston Company and had charge of the electrical installation of the Second Avenue Passenger Railway of Pittsburg, the first electric railway to be built in that city. He later had charge of the electrical installation of the Missouri Street Railway of St. Louis; the City Electric Railway of Little Rock, Ark., in which work he was associated with Mr. Bion J. Arnold; the Ft. Clark Street Railway of Peoria, Ill.; and the Ft. Wayne & Belle Isle Railway of Detroit, Mich. He then became manager for the General Electric Company of street railways in Kalamazoo and Battle Creek, Mich. Later he was associated with his brother and F. N. Rowley in the Michigan Traction Company and the Railways General Company at Battle Creek, building a 10-mile road in less than 60 days. He then went to Indianapolis and had charge of a road under construction between Anderson and Marion, Ind. In 1897 he was engaged by Mr. George J. Kobusch of St. Louis, Mo., as general manager of the Winnebago Traction Company of Oshkosh, Wis. He remained with this company 7½ years as general manager, vice-president and president and constructed several lines in the vicinity of Oshkosh in connection with Clement C. Smith, president of the Columbia Construction Company. In October, 1904, he resigned to go to San Francisco, Cal., representing the banking firm of E. H. Rollins & Son of Boston, where he became general manager of the Petaluma & Santa Rosa Railway, operating 35 miles of interurban railway and a 35-mile steamboat line. In March, 1906, he returned to the east and promoted and partially completed a large amusement park near Philadelphia, known as Beechwood park. He now succeeds Mr. E. B. Kirk, who resigned to become general manager of the Atlantic Shore Line Railway, Portsmouth, N. H.

E. E. Downs.

OBITUARY.

William H. Hoover, formerly superintendent and master mechanic of the Lykens & Williams Valley Street Railway at Williamstown, Pa., died recently.

Charles H. Dalton, who served continuously from January 1, 1894, to October 11, 1906, as chairman of the Boston, Mass., transit commission, died on February 23, aged 82 years.

Josia K. Rougher, formerly president of the Burlington County Railway Company, Mt. Holly, N. J., died recently. Dr. William C. Parry, vice-president of the company, will succeed him.

Financial News

Albany & Hudson Railroad, Hudson, N. Y.—Bondholders have been asked to accept certificates convertible into first mortgage bonds of the company in exchange for their coupons due in 1908 and 1909. The first of the 1908 coupons was due on March 1. The circular states that the company will give one $1,000 certificate for each $875 face value of coupons. The company has an authorized bond issue of $2,000,000, of which $1,750,000 bonds are outstanding and $100,000 bonds are in the treasury, having been authorized for betterments and improvements. Application will be made to the New York public service commission, second district, for approval of the issue of the remaining $150,000 bonds authorized. The plan for refunding the coupons will be operative upon the acceptance of holders of two-thirds of the bonds.

Anderson (S. C.) Traction Company.—Edwin W. Robertson of Columbia, S. C., and Robert E. Ligon of Anderson were appointed receivers for this company by Judge Kleugh at Abbeville, S. C., on March 4 on the application of the Anderson Machine & Foundry Company. The indebtedness of the company is stated at $200,000, including $163,000 secured by a mortgage.

Boston & Worcester Street Railway, Boston.—William M. Butler, who succeeded James F. Shaw as president, is quoted as saying: "I can positively state that there is no truth in the stories that the Boston & Worcester will be sold to the New York New Haven & Hartford Railroad or the Boston Elevated Railway. The company will continue as it has in the past, and I do not look for any changes."

Camden & Trenton Railway, Camden, N. J.—The following protective committee, representing holders of the first mortgage bonds, has been organized in Philadelphia: Edward Powell, J. B. Eldridge, Robert Pearsall, Clarence L. Harper and Talcott Williams. The committee urges holders of the bonds to deposit them with the Union Trust Company of Philadelphia not later than April 1. The agreement under which the bonds are to be deposited provides that the committee shall be authorized to foreclose the mortgage and buy in the property; to sell the bonds subject to the right of dissatisfied depositors to withdraw; or to prepare a plan of reorganization which shall be effective if accepted by a majority of the holders.

Chicago & Milwaukee Electric Railroad.—Petitions to have A. C. Frost, president of the Chicago & Milwaukee Electric Railroad, declared bankrupt have been filed in the United States district court at Chicago. The petitions charge that the proceedings as a result of which George M. Seward was named receiver for A. C. Frost & Co., were collusive. The petitioners are Justin K. Orvis of Waukegan, Ill. and the Western Bank Note and Engraving Company and the Hartzell-Lord Company of Chicago. Their claims aggregate approximately $5,600, and they charge that Mr. Frost has committed a long series of acts of bankruptcy, including the agreement whereby Charles G. Dawes was made trustee when the troubles in the Chicago & Milwaukee Electric Railroad were first made public on December 31, 1907.—F. S. Munro has been appointed temporary receiver for the Republic Construction Company by Judge Grosscup of the United States circuit court, who issued a restraining order enjoining creditors from prosecuting suits or interfering with the property of the company.—Judge W. D. Tarrant of Milwaukee appointed the Fidelity Trust Company of that city receiver in Wisconsin for the Chicago & Milwaukee Electric Railway. The receiver was appointed on application of the Columbia Construction Company, which set forth that the company was insolvent and that a receivership was the only course that would enable the company to pay its creditors and save the system to the public. The complaint states that between July 10 and November 21, 1907, the construction company built two miles of track for the railway, the contract price for which was $57,025. On September 13 the defendant company paid $16,287 of this amount and on November 21, $5,000.

Chicago City Railway.—The syndicate which owns nearly all of the capital stock has called upon its subscribers to pay 0.8 per cent on the par value of their subscriptions on account of actual expenses and disbursements incurred for syndicate operations.

Chicago Railways Company.—The $2,500,000 of 5 per cent first mortgage bonds offered last week were sold so quickly that the banks which participated in the first offering have offered a second block of $2,500,000 for sale.

Delaware River & Atlantic City Railroad.—Vice-Chancellor Leaming was to have heard arguments at Camden, N. J., on March 9 on the return of a rule to show cause why a receiver should not be appointed for this company. Lewis A. Starr, counsel for minority stockholders, asserted that the petitioner was not a stockholder, and that he had no right to apply for a receiver. William T. Harris, who filed the application in behalf of Charles T. Maloney, filed an affidavit asserting that Mr. Maloney was the owner of 10 shares of stock, but that he had given them into the custody of Walter N. Boyer, Jr., for the purpose of financing the proposed road. Mr. Starr, replying to the allegations of the petition, said that the enterprise had progressed in a satisfactory manner until 1903, when a faction, headed by William J. Thompson, conceived a plan to control the board of directors. This faction voted 112,000 shares at a meeting of the shareholders on October 16 last.

Exeter Hampton & Amesbury Street Railway, Exeter, N. H.—The property of this company was sold at foreclosure at Hampton, N. H., on March 10, to Charles Penny of Hartford, Conn., representing a committee of bondholders.

Indianapolis & Cincinnati Traction Company, Indianapolis, Ind.—A reorganization agreement has been sent to holders of stocks and bonds for signature. The agreement provides that each subscriber shall transfer his securities to five trustees on or before April 30, to be controlled or disposed of by the trustees in accordance with the terms of the agreement. The trustees named are: Theodore F. Rose and George A. Ball, Muncie; Winfield T. Durbin, Anderson; John J. Appel, Indianapolis; and Claude Cambern, Rushville, Ind. If the owners of all the stock and bonds consent to the agreement, the trustees will have the receivership ended and the indebtedness paid and will raise capital for the extension of the road from Connersville, Ind., to Hamilton, O. To secure the necessary funds for these purposes, the trustees would be empowered to sell all or part of the bonds. If all of the securities are not deposited under the agreement the trustees are authorized to take such steps as they may deem proper to end the receivership by sale of the property at foreclosure and to become purchasers on behalf of the subscribers to the agreement, provided that the property does not bring a price which the trustees would deem greater than it would be wise to pay. If the trustees acquire the property in this manner, they would organize a new company. The agreement was approved at a recent meeting of holders of the securities, at which more than three-fourths of the capital stock and bonds were represented.

Interborough Rapid Transit Company, New York.—Formal application has been made to the New York public service commission, first district, for approval of the execution by this company of a mortgage upon all of its real property and all of its interests as lessee of the rapid transit railroads, derived by asignment from John B. McDonald and the Rapid Transit Subway Construction Company and other property, to secure an issue of not to exceed $55,000,000 of bonds, to be dated November 1, 1907, and to be payable on November 1, 1952, with interest at a rate to be fixed by the directors from time to time. The bonds are to be subject to purchase at 110 through the operations of a sinking fund of $300,000 per annum, beginning November 1, 1910. The bonds are also to be subject to payment and cancellation in amounts of not less than $1,000,000 at 110. The company would set aside not exceeding $18,000,000 of the bonds for the retirement of $15,000,000 of 4 per cent notes due on May 1, 1908. For the retirement of $10,000,000 notes due on March 1, 1910, not exceeding $12,000,000 of the new bonds would be resecured. The remainder of the bonds would be issued from time to time to pay for construction or acquisition of, or improvements, betterments, additions to, extensions of or in payment for, lines of rapid transit railway in New York and other lines of railway of any character in that city owned or leased by a corporation at least 90 per cent of the stock of which is owned by the Interborough company, or to fund indebtedness of the company, or indebtedness of any other company assumed or guaranteed by the company and contracted for one of these purposes. The company desires to issue $18,000,000 bonds now for the retirement of the notes maturing in May, and $12,000,000 additional to fund time and demand loans and accounts payable. These current unsecured obligations were incurred principally for the following purposes: Excess cost of that part of the Brooklyn extension of the subway in operation on December 31, 1907, $2,624,910; on account of equipment of subway under contracts Numbers 1 and 2 with New York, $7,727,816; total, $10,352,726. The mortgage has been authorized by the directors of the company, and a special meeting of stockholders has been called for March 17, 1908, for the purpose of acting upon the proposition to issue the bonds. As it may be necessary to issue promissory notes in extension of the notes due on May 1, and to secure the payment of such notes by the pledge of the $18,000,000 bonds, the company also asks the commission to approve the issue by it of not exceeding $25,000,000 of notes, with interest at not exceeding 6 per cent, secured by the pledge of not exceeding $30,000,000 face value of the bonds. The statement of cash cost of properties included in the proposed mortgage is given as follows: Value of leases of subway taken at actual amount of cash expended for equipment, and the actual amount for construction, in excess of amount received from City of New York, $35,752,699; real estate not included in equipment, $196,814; capital stock of Rapid Transit Subway construction at par, being amount paid in cash, $6,000,000; stocks and bonds of the following named companies at cash cost to Interborough Rapid Transit Company: Subway Realty Company, $2,106,266; New York & Queens County Railway, $2,000,152; New York & Long Island Traction Company, $744,557; Long Island Electric Railway, $612,821; total, $6,363,796; Manhattan Guaranty fund, (which by the agreement under which the gold notes maturing on May 1, 1908, were issued, is appropriated to the security of the gold notes), $1,057,987; amounts due from companies the stocks of which are included in the mortgage: New York & Queens Company Railway, $732,000; New York & Long Island Traction Company, $50,000; Subway Realty Company, $942,123; total, $1,724,123—$51,095,419.

Louisville (Ky.) Traction Company.—A special meeting of shareholders will be held on April 15 to vote on the question of issuing $1,000,000 additional preferred stock, making a total of $3,500,000 outstanding.

New Orleans (La.) Railway & Light Company.—Gross earnings in 1907 were $6,041,291, of which $3,987,733 was contributed by the railway department. Operating expenses were $3,270,397, of which $2,411,759 was on account of the railway department. Net earnings were $2,770,894.

Rochester Syracuse & Eastern Railroad, Syracuse, N. Y.—A certificate of increase in the capital stock from $6,000,000 to $8,500,000 has been filed at Albany.

Schenectady (N. Y.) Railway.—A. H. Harris of New York and E. S. Fassett, general manager of the United Traction Company of Albany, have been elected directors.

United Railroads of San Francisco.—The following statement, showing the effect upon gross earnings from the strike, has been made public:

Months—	1906.	1907.	Decrease.
June	$448,455	$152,126	$296,329
August	429,311	317,769	111,542
September	425,199	367,220	57,979
November	546,166	449,732	96,428
December	562,206	481,285	89,915

The Westinghouse Electric & Manufacturing Company has obtained permission from the United States district court in Pittsburg to join with other creditors of the United Railroads of San Francisco in a plan for the adjustment of the railway company's floating indebtedness, amounting to $3,500,000. While the plan has not been announced, it was reported that it provides for an issue of $3,500,000 of 6 per cent notes by the United Railways Investment Company, which owns the entire capital stock of the United Railroads, to be secured by $3,500,000 of 7 per cent first preferred stock of the railroad company, half of the notes to mature in August, 1913, and half in February, 1914.

ELECTRIC RAILWAY EARNINGS.

Galveston-Houston Electric Company.

December—	1907.	1906.
Gross earnings	$87,668.85	*$81,375.26
Operating expenses and taxes	54,430.70	50,444.49
Net earnings	33,238.15	30,930.77
Interest charges	13,749.89	11,958.34
Balance	19,488.26	18,972.43
Bond sinking fund	2,608.75	2,537.50
Balance	16,879.51	16,434.93

Savannah (Ga.) Electric Company.

December—	1907.	1906.
Gross earnings	$53,566.10	$48,655.54
Operating expenses and taxes	39,258.19	32,835.55
Net earnings	14,307.91	15,819.99
Interest charges	12,391.75	11,300.00
Balance	1,196.16	4,519.99
Improvement fund	1,666.74	1,666.64
Balance	249.42	2,853.35

Tampa (Fla.) Electric Company.

December—	1907.	1906.
Gross earnings	$45,895.00	$41,161.36
Operating expenses and taxes	29,510.13	28,907.22
Net earnings	16,384.87	12,194.14
Interest charges	729.14	680.85
Balance	15,655.73	11,513.29

Dallas (Tex.) Electric Corporation and Subsidiary Companies.

December—	1907.	1906.
Gross earnings and income from securities	$96,630.09	$89,438.79
Operating expenses and taxes	72,263.87	72,159.00
Net earnings	24,366.22	17,279.79
Interest charges	20,147.08	16,225.00
Balance	4,219.14	1,054.79

Deficit	100.14	2,389.28

Kansas City Railway & Light Company.

January—	1908.	1907.
Gross earnings	$496,321.33	$479,021.63
Operating expenses	258,830.84	238,017.74
Net earnings	237,490.49	241,003.89
Taxes and interest	151,277.80	147,519.37
Net income	86,212.69	93,484.52

Twin City Rapid Transit Company.

January—	1908.	1907.
Total earnings	$469,891.21	$456,837.38
Operating expense	258,200.90	243,097.42
Net earnings	211,690.31	213,739.96
Deductions	121,955.55	115,258.34
Surplus	89,734.76	98,481.62

Dividends Declared.

Interborough Rapid Transit Company, New York, quarterly, 2¼ per cent.

Northern Ohio Traction & Light Co., Akron, O., quarterly, ½ of 1 per cent.

Philadelphia Traction Company, 4 per cent.

Portland (Ore.) Railway Light & Power Co., preferred, quarterly, 1¼ per cent.

South Side Elevated Railroad, Chicago, quarterly, ¾ of 1 per cent.

Twin City Rapid Transit Company, Minneapolis, preferred, quarterly, 1¾ per cent.

United Traction & Electric Company, Providence, R. I., quarterly, 1¼ per cent.

Manufactures and Supplies

ROLLING STOCK.

Sarnia Street Railway, Sarnia, Ont., is reported to be in the market for new rolling stock.

Philadelphia Rapid Transit Company, Philadelphia, Pa., is building eight new double-truck ash cars of a special type in its own shops.

Berlin & Waterloo Street Railway, Berlin, Ont., is having several cars rebuilt by the Preston Car & Coach Company, Limited, Preston, Ont.

Mount Hood Railway & Power Company, Portland, Ore., has ordered 40 flat cars, 60,000 pounds capacity, from the Hicks Locomotive & Car Works.

Chicago Ottawa & Peoria Railway, H. E. Chubbuck, general manager, Ottawa, Ill., has ordered six double-truck cars, 40 feet 10 inches long, from the Danville Car Company.

Illinois Valley Railway, La Salle, Ill., is having six semi-convertible cars, to be used as trailers, built by the Danville Car Company. Delivery is to be made in May. The specifications include the following details:

Seating capacity ..... 40 passengers	Height inside .....8 ft. 6 in.
Wheel base .....4 ft.	Sill to trolley base..... .....8 ft. 10¼ in.
Length of body.....32 ft.	Track to trolley base.... .....11 ft. 8 in.
Over vestibule...39 ft. 10 in.	Body .....Semi-steel
Over all .....40 ft. 10 in.	Underframe ....Combination
Width inside .....8 ft. 2½ in.	
Over all .....9 ft. 2 in.	

Special Equipment.

Air brakes...General Electric	Fenders .....Co. standard
Bolsters, truck.....Danville	Hand brakes .....Peacock
Couplers .....Tomlinson	Trucks .....Danville
Curtain material...Pantasote	

Quincy Horse Railway & Carrying Company, Quincy, Ill., has ordered eight open center aisle cars and two closed cars from the Danville Car Company. Delivery is to be made in May and August, respectively. The specifications include the following details:

Open Center Aisle Cars.

Seating capacity ..... 40 passengers	Height sill to trolley base.. .....8 ft. ½ in.
Wheel base .....8 ft.	Track to trolley base ... .11 ft. 11 in.
Length of body over vestibule .....29 ft.	Body .....Wood and metal
Over all .....30 ft.	Underframe.Wood-faced metal
Width inside .....7 ft. 2 in.	
Over all .....8 ft. 6 in.	

Closed Cars.

Seating capacity ..... 20 passengers	Height inside .....8 ft. 4 in.
Wheel base .....7 ft.	Sill to trolley base..... .....8 ft. 10 in.
Length of body.....18 ft.	Track to trolley base.... .....11 ft. 11 in.
Over vestibule .....28 ft.	Body .....Metal facing
Over all .....29 ft. 2 in.	Underframe..Wood reinforced
Width inside .....7 ft.	
Over all .....8 ft. 4 in.	

Special Equipment.

Couplers .....Danville	Gongs .....Danville
Curtain fixtures .....Acme	Hand brakes .....Peacock
Curtain material...Pantasote	Headlights .....Syracuse
Destination signs ....Hunter illuminated	Motors ....2 Westinghouse 49
Fenders .....Co. standard	Trucks .....Brill

Rochester Syracuse & Eastern Railway, Syracuse, N. Y., was reported in our issue of February 15 as having practically placed its order for two double-truck cars with the Cincinnati Car Company. We are now advised that the order has been placed with The J. G. Brill Company.

SHOPS AND BUILDINGS.

Denver & Interurban Railroad, Denver, Colo.—On March 10 work was begun on this company's car house at Twenty-third and Market streets, Denver. The building will have a frontage of 168 feet on Market street and 125 feet on Twenty-third street.

TRADE NOTES.

Ridgway Dynamo & Engine Company, Ridgway, Pa., announces the opening of a district sales office at 907 Andrews

building, Cincinnati, O. George W. Euker, who has had extensive experience in electrical and power plant work, is in charge.

Raymond Concrete Pile Company of New York has opened an office in the Arcade building, Philadelphia, in charge of Percy H. Wilson.

New York Car & Truck Company, Kingston, N. Y., has had a petition in bankruptcy filed against it. The assets are said to be about $75,000.

F. P. Harrison Electric & Manufacturing Company, 169 South street, New York, has been placed in bankruptcy. The receivers have not yet been appointed.

Weber Gas Engine Company, Kansas City, Mo., will furnish a gas engine to supply the power for the new plant of the Page-Storms Forge Company of Springfield, Mass.

Railway Steel-Spring Company, New York, at its annual meeting held on March 5 re-elected all the retiring directors. The report for the year ended December 31, 1907, showed net earnings of $2,320,136.75.

Taylor & Fenn Company, Hartford, Conn., is shipping a large order of drill presses to Germany. The company expects to be as busy as ever by April 1, and is looking forward to a large business this season.

Alfred Box & Co., Front and Poplar streets, Philadelphia, have received an order from the New York City Railway for a 20-ton hand power crane to be installed in the substation at Houston street and Broadway.

Frances A. McIntosh, formerly with the Standard Tool Company, Cleveland, O., has been appointed advertising manager of the Buffalo Forge Company, Buffalo Steam Pump Company, and George F. Squier Manufacturing Company, all of Buffalo, N. Y.

Westinghouse Machine Company's rehabilitation is now assured. The creditors' committee has met with the receivers and agreed to the plan to issue bonds in denomination of $500 for all indebtedness, other than amounts smaller than $500, which will be paid in cash.

Arthur West, who has been chief engineer of the Westinghouse Machine Company for the past several years, has resigned and on May 1 will become manager of the power department of the Bethlehem Steel Company in charge of manufacturing, engineering and sales.

Robins Conveying Belt Company of Passaic, N. J., with a branch office at 53 State street, Boston, is finishing contracts at the Lincoln wharf and Harvard power stations of the Boston Elevated Railway, and at the power station of the United Electric Light Company of Springfield, Mass.

R. S. Stangland has been placed in charge of Muralt & Co.'s construction office at New Ft. Lyon, Colo., and will superintend the erection of the complete lighting, heating and power plant which this firm is building for the United States government at the New Ft. Lyon naval hospital.

American Car & Foundry Company has declared the regular quarterly dividends of 1 per cent on the common stock and 1¾ per cent on the preferred stock, payable on April 1 to stockholders of record March 10. The company's report for the quarter ended January 31 shows net earnings of $1,772,200.

F. A. Lawson & Co., 209 Monadnock building, San Francisco, Cal., have secured the Pacific coast agency for Dossert & Co.'s solderless cable connectors and terminals and have already placed large orders for Dossert joints. They report great activity in the electrical construction field on the coast.

Pittsburg Automatic Vise & Tool Company, Pittsburg, Pa., has opened a branch office in the Dwight building, Kansas City, in charge of E. Metz, Jr. The company has been awarded a contract for complete finishing equipment for vises for the new plant of the Schoen Steel Wheel Company at Newlay, Yorkshire, England.

Berger Manufacturing Company, Canton, O., elected the following officers for the ensuing year: E. A. Langenbach, president and general manager; Fred Snyder, first vice-president; R. H. Yancey, second vice-president; C. A. Irwin, secretary and general superintendent; Frank A. Schwertner, treasurer; and C. W. Kreig, assistant treasurer and auditor.

James F. Shaw & Co., Incorporated, electric railway builder, Boston, Mass., on March 2 was placed in the hands of Arthur D. Hill of Boston as receiver. This action was taken upon the petition of a creditor and of the company also. The liabilities are $709,976, while the assets, which are not readily negotiable, are said to be $880,000. The company has issued a statement that the legal proceedings were instituted to prevent disadvantageous sale of securities held as collateral by its creditors, and expressing confidence that a proper handling of the affairs will result in full payment of all creditors.

American Brake Shoe & Foundry Company, Mahwah, N. J., has made arrangements with the Illinois Valley Railway, La Salle, Ill., Galesburg Railway & Light Co., Galesburg, Ill., Quincy Horse Railway & Carrying Company, Quincy, Ill., and the Wichita Railroad & Light Company, Wichita, Kan., for the standardization of these companies' brakeshoes as adopted by the American Street & Interurban Railway Association.

Flexible Compound Company, 3607 Haverford avenue, Philadelphia, has appointed the following agents for its flexible compound for waterproofing and general protective purposes: Timms, Cress & Co., Portland, Ore.; S. P. Holmes & Co., Chicago; J. G. Chadwick & Co., Lakewood, near Cleveland, O.; D. R. Whitaker, 72 Park place, New York; F. A. Barbey, Boston, Mass.; Howard R. Justice, London, Eng.

Protective Tread Company, Boston, Mass., has invented a new tread which will be placed upon the market at some future date. The tread consists of rubber vulcanized into a steel base, and promises to revolutionize all other inventions of this class. At the present time only 50 feet have been manufactured. A part of this has been placed in one of the elevators at 53 State street, Boston, and after hard usage does not as yet show the indentation of the steel through the rubber covering.

Electric Cable Company, 17 Battery place, New York, whose plant at Bridgeport, Conn., was partially destroyed by fire, announces that arrangements have been made which will permit of filling all orders received for its various products, including Voltax, the transparent protective compound, rubber covered wires, weatherproof wires and cables, magnet wires, annunciator and office wire, etc. Pending adjustment of insurance details, the company will make no announcement of its plans for rebuilding.

The American Street and Interurban Railway Manufacturers' Association, through its executive committee, at a meeting held by that committee in New York on March 6, elected two vice-presidents in accordance with the recently adopted amendment to the by-laws. Charles C. Peirce was elected vice-president in charge of entertainment, and K. D. Hequembourg vice-president in charge of exhibits. Both of the newly elected vice-presidents were given authority to select their own assistants. J. H. McGraw was elected chairman of the committee on conference to discuss matters of mutual concern with the American association. Messrs. Ellicott, president of the Manufacturers' association, C. C. Peirce and Arthur Partridge were chosen as a subcommittee to visit Denver with the representatives of the American association in connection with the investigations that are to be made relative to the selection of the place for holding the next annual convention.

ADVERTISING LITERATURE.

Universal Stone Crusher Company, Cedar Rapids, Ia.—An attractive catalogue illustrates and describes the Velten system of concrete machinery.

Raymond Concrete Pile Company, New York, N. Y.—An article on concrete pile foundations has been reprinted in pamphlet form, fully illustrated.

Expanded Metal & Corrugated Bar Company, St. Louis, Mo.—A mailing card of unique design directs attention to this company's corrugated bars for reinforced concrete construction.

Disc Grader & Plow Company, Hunter, N. D.—An attractive illustrated booklet sets forth the advantages of the rotary disc plowing attachment for elevating graders manufactured by this company. The device is especially adapted for railway grading.

Railway Specialty & Supply Company, Chicago, Ill.—Bulletin S-128 illustrates and describes the ideal ground plate designed for use in connection with signal systems. It emphasizes the important relation of efficient ground connection to the proper protection of signal apparatus.

Westinghouse Traction Brake Company, Pittsburg, Pa.—A reprint of a paper entitled "Magnetic Brakes," and presented by A. L. C. Fell before the Tramways and Light Railways Association, in London, England, has been prepared for distribution in neat pamphlet form. A number of explanatory tables and diagrams are included.

Allis-Chalmers Company, Milwaukee, Wis.—Recently issued publications include a 32-page bulletin, No. 1508, de-

voted to the electrically operated air brake.—Bulletin No. 1050 contains a complete description of alternating-current generators, water-wheel type, which are adapted to meet the exacting requirements of continuous service in the largest water power plants. A number of such plants are illustrated.

Railway Steel-Spring Company, 30 Church Street, New York, N. Y.—A handsome catalogue of 48 pages and cover devoted to the Latrobe tire department is the first tire catalogue issued by this company since its acquisition of the Latrobe plant January 1, 1906. Various products are illustrated by fine halftones and fully described, including weldless forged and rolled locomotive driving tires, tender, truck, car wheel and motor tires, double flanged crane tires, gear rings, weldless wrought steel pipe flanges, etc. Valuable tables and diagrams are features of the book.

Fibre Conduit Company, Orangeburg, N. Y.—A series of interesting booklets is being published in attractive form to set forth the advantages of Orangeburg fiber conduit. One, under the title of "Lightness and Economy," demonstrates by picture and text that a laborer easily carries 30 feet of 3-inch conduit in his arms, that a 1-team truck carries over 3,000 feet and that 25,000 feet are loaded in one car of the usual 30,000 pounds capacity. It is stated that in a recent installation of 30 ducts in parallel, one man in the trench, with two helpers, laid 6,500 ducts feet in four hours. Another booklet entitled "Laboratory Tests," contains a detailed report of tests made on Orangeburg fiber conduit by the Electrical Testing Laboratories of New York.

Western Electric Company, Chicago, Ill.—This company's 1908 general catalogue, now being distributed, is a substantial cloth-bound volume of 840 pages. The cover is unusually striking in design and color scheme. The catalogue lists all such electrical supplies and apparatus as are constantly in demand, including, of course, those for electric railway use. The arrangement is excellent and a large number of illustrations are used to good advantage. Tables of useful information add much to the catalogue's value for reference purposes, and a comprehensive index makes it easy to locate any desired subject. A series of halftone engravings following the title page depict the company's Chicago Clinton street works, Hawthorne works, New York City works and its branch houses in Philadelphia, St. Louis, St. Paul, San Francisco, Cincinnati, Kansas City, Denver, Pittsburg, Atlanta, Los Angeles and Seattle.

General Electric Company, Schenectady, N. Y.—Recently issued bulletins include No. 4566, which describes some new types of tantalum lamps now on the market. These lamps are rated for 40, 50 and 80 watts. The 40 and 50 watt types replace the former 44-watt lamp. The 50-watt lamp will enable stations to maintain their output per lamp the same as with the present 16-candlepower lamp and give the customer 50 per cent increase in the candlepower. An interesting table is given showing the saving secured for 750 hours of service at various loads per kilowatt-hour, which indicates that with the average cost of current to the consumer now in force, the tantalum lamp saves more than twice its cost. Under the heading, "Solution of Illuminating Problems," an interesting outline is given of the best methods of selecting proper units for various conditions.—Bulletin No. 4571 is devoted to the General Electric tungsten lamp for street lighting.

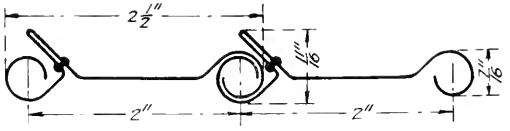
Green Fuel Economizer Company, Matteawan, N. Y.—The Book of the Economizer is an interesting and valuable publication containing 160 pages, 6 by 9 inches, fully illustrated with a large number of halftones, line drawings and tables. The book is for all who manage, design or operate steam power plants. It takes up not only the history and merits of the Green fuel economizer, but also such engineering topics as the absorption of heat by different parts of the boiler surface; the relative economy of boiler surface and economizer surface under various conditions, methods of determining the economy of additional heating surface from the load curve; the effects of oil fuel, high steam pressures and superheat on boiler economy; methods of measuring the temperature of flue gases; and reports of various tests of boiler plants containing economizers. The general scope of the book may be inferred from the following chapter headings: "The Economizer and Its Inventor, Elementary Theory of the Economizer, Forcing Capacity of Boilers, The Profit from an Economizer, Secondary Advantages of the Economizer, The Economizer in Small Boiler Plants, Calculating the Performance of an Economizer, A Simple Method of Figuring the Saving, Actual Saving Greater than Theoretical Saving, Measuring the Temperature of the Flue Gases, Actual Results Obtained in Economy Tests of Economizers, Design and Construction of the Fuel Economizer, The Waste-Heat Air Heater, The Air Heater and the Economizer in Water Gas Manufacture, Chimneys, Mechanical Draft, Steam and Fan Tables."

ERWOOD'S REVERSIBLE ROLLING DOOR.

The advantages attained in the use of doors composed of independent slats of metal each hooked to the other, for closing large openings in roundhouses, shipping platforms, wagon ways and fire walls, core and drying ovens, etc., are apparent. Such doors occupy a limited space over the opening and are readily operated by a light chain or automatic fusing link.

Doors of this type have of late years found favor in connection with large core oven and dry kiln work, where a fireproof and fairly air-tight closure is sufficient.

Core ovens of 20 feet in width at the opening and subjected to the ordinary temperature of such a service have been successfully sealed in this way. In the ordinary rolling shutter the slats are of an S shape, and consequently but one side of this combination is water and dust proof, as is obvious in



Erwood's Reversible Rolling Door—Section Showing Two Slats.

hooking two such shapes into each other, consequently, while it has been the custom to place the weather side outward and thus shield the hinges from the elements and dust, the inside, where the hinge is exposed by the open groove, is subject to rapid wear and corrosion because of the admission of moisture and dirt. The Erwood patented reversible shutter is designed to provide a reversible element with both sides weather-proof. The reverse or inside of the slat or shutter is protected by a shield composed (in this instance) of a portion of the sheet constituting the slat; the shield extends over the opening of the hinge and acts as a watershed or eave. This extends down to the center of the hinge and prevents drip or dust from lodging in the vital part of the shutter. This invention permits of the use of a flat web to the slat, which in rolling occupies less space.

This shutter is the invention of John Erwood, 1604 West Adams street, Chicago.

THE PROFIT FROM AN ECONOMIZER.

The following paragraphs are taken from a book on economizer practice recently issued by the Green Fuel Economizer Company, Matteawan, N. Y.:

The profit from an economizer due to the heat saving is the value of fuel saved, labor saved and steaming capacity gained above the interest on the first cost plus the cost of upkeep. The fuel saving can be calculated beforehand. Theoretically, that is, considering only the heat contributed directly by the economizer, it amounts to nearly 1 per cent of fuel for each 11 degrees that the water is raised in temperature by the economizer, since to make steam at 100 pounds pressure from feedwater at 60 degrees F., for instance, requires 1,137 British thermal units.

Fuel records taken before and after putting in Green fuel economizers often show savings as high as 1 per cent of coal for each 7 or 8 degrees that the feedwater is heated, so that if the rise is 150 degrees, which is not unusual where the boilers and fires are driven at a high rate, the actual saving amounts to about 18 per cent. As Prof. R. C. Carpenter says: "Under usual conditions the economizer will save 12 to 15 per cent of the coal bill each year." There are good reasons for this added economy, since, first, the economizer reduces the rate of driving of the boiler; and, second, the heat saved by the economizer replaces an equivalent amount of heat from coal on the grate, and, as a result of the lower rate of burning, better combustion and better furnace efficiency are obtained—especially where the furnace has previously been overdriven. The economizer constitutes additional heating surface that contributes heat without additional fire. The efficiency of the boiler plant is also enhanced by the fact that much of the scale-forming matter in the water is precipitated in the economizer, where it settles in the bottom headers, whence it is washed out more easily than it could be removed after baking onto the boiler tubes.

With the flue gases leaving the boiler at a temperature of 650 degrees F., the economizer may heat the water up to the boiler evaporation point. This temperature of the flue gases implies about 5.8 square feet of surface in the boiler per horsepower developed and is by no means exceptional, since boilers have been sold on ratings of 7 square feet per horsepower and boilers installed on a much more conservative basis are often

brought up to this rating to meet the growth of the business. A boiler of good design will make steam at this rate without priming, but not economically, as the high flue temperature indicates. Good economy requires either more boiler surface or a Green fuel economizer.

The maximum possible saving by an economizer is based upon the assumption that the construction of the economizer unfits it for the generation of steam but that it may be allowed to do all the work of heating the water up to the boiler evaporating temperature. In a certain plant tested, the boiler pressure was 95 pounds, the corresponding temperature of evaporation being 334 degrees F. The temperature of the feedwater entering the economizer was 162.5 degrees, so that it was theoretically possible for the economizer to contribute 334 minus 162.5=171.5 British thermal units. The number of thermal units required for the actual evaporation of water at 95 pounds is 877 degrees. The total work done on the water is therefore 887.9 plus 171.5=1,049.4 heat units, of which 171.5 constitutes 16.3 per cent, or the maximum proportion of the work that could be done by the economizer receiving water at 162.5 degrees, which was the actual temperature, the water in this case coming from an open heater where it had been warmed by the exhaust of the pumps and certain other auxiliary apparatus.

COMPRESSION ROLLER SASH FIXTURE.

The Edwards compression roller and anti-rattler for window sash, which is extensively used on steam and electric coaches, steamships, ferry boats and office buildings, is shown in the accompanying illustration in operative position, with the sash or casing broken away to admit of an unobstructed view. The device is designed to hold the sash firmly against the outside stop casing, keeping out the cold air and preventing rattling, and has met with success, some hundreds of cars having been equipped with it during the last three years. In

Compression Roller Sash Fixture.

severe climates it has proved to increase greatly the comfort of passengers. It has recently been installed on ferry boats operating in New York harbor and is being made standard after a series of successful tests, and we are advised that the United States government has adopted the device on all lighthouse tenders, to be used in connection with the Edwards bevel bolt sash lock and bevel notch stop bar. The President's yacht, the "Mayflower," has also been equipped with these fixtures, as well as several other boats belonging to the government.

The O. M. Edwards Company, Syracuse, N. Y., is the manufacturer of this device.

LARGE GALVANIZED STEEL POLES FOR TRANSMISSION WORK.

The Great Western Power Company, of California, has adopted the "Milliken pole" for use in carrying its high voltage power transmission line. The power is transmitted on two circuits of three wires each, carrying current at 100,000 volts pressure. In view of this high voltage and the extreme length of lines, eventually 1,000 miles, great care was exercised in designing the poles.

The pole is designed with three crossarms, it being intended to carry a feed wire on the outer end of each crossarm by suspended insulation. The top of the pole is arranged to carry a guard or ground wire. The poles will be set about 750 feet apart.

Galvanized Steel Pole.

The bottom of the lowest crossarm is 51 feet 2 inches above the ground level, and the second crossarm is 10 feet above the first, and the third crossarm is 10 feet above the second. The extreme top of the pole carrying a guard wire is 5 feet 1 inch above the bottom of the highest crossarm. The wires are to be 17 feet 1 inch from each other in a horizontal plane for the two upper crossarms, and 18 feet 1 inch for the lowest crossarm; thus making all feed wires 6 feet 5 inches from the nearest part of the pole proper measured in a horizontal direction.

The bottom of the pole at the ground level occupies a base 17 feet square. The stub ends of the pole, i. e., the portion of the pole in the ground, are separate pieces of steel and are of such length as to allow of 6 feet for bedding in the ground.

These poles are constructed entirely of structural steel shapes and are designed to follow the theoretical stresses and produce a pole of given strength and stiffness, with a minimum amount of material. There are a great many duplicate pieces, thus making it a simple matter for the purchaser to assemble them in the field.

Very complete and careful tests of the strength of these poles were made before their regular manufacture was started. The test pole was erected in a vertical position on an immovable concrete foundation. The strains were applied by means of weights hanging from a fixed structure, and the amount of load and deflection was easily determined. The pole was designed to stand the following tests:

When tested in a vertical position, on an immovable foundation, and with a proper margin of safety a simultaneous horizontal side pull of 1,000 pounds at the top and 2,500 pounds at each of the three crossarms, or in other words, a total strain of 8,500 pounds the crossarms were to support a suspended weight of 1,000 pounds at their extreme ends and any one of the crossarms to carry at one of these ends a horizontal pull along the direction of the line of 3,000 pounds.

The Receivers of Milliken Bros. (Inc.), 11 Broadway, New York City, are manufacturing these poles at Milliken, Staten Island, N. Y., where complete arrangements have been made in the bridge and structural shops for getting out this particular class of structural work.

As all of this material (except bolts and nuts) is galvanized by the hot process before shipment, and after all the shop work has been done, there has been added to the Milliken plant a large galvanizing department for doing this particular work. In fact, it is said that it has the largest hot galvanizing bath ever constructed. This bath is capable of taking pieces somewhat over 30 feet in length at a single dipping, which is a decided improvement over the old-fashioned method of dip-

ping long pieces one end at a time. The facilities are very complete in this plant for turning out large quantities of this class of work quickly.

NEW FOUNDRY OF THE AMERICAN BRAKE SHOE & FOUNDRY COMPANY AT CHATTANOOGA, TENN.

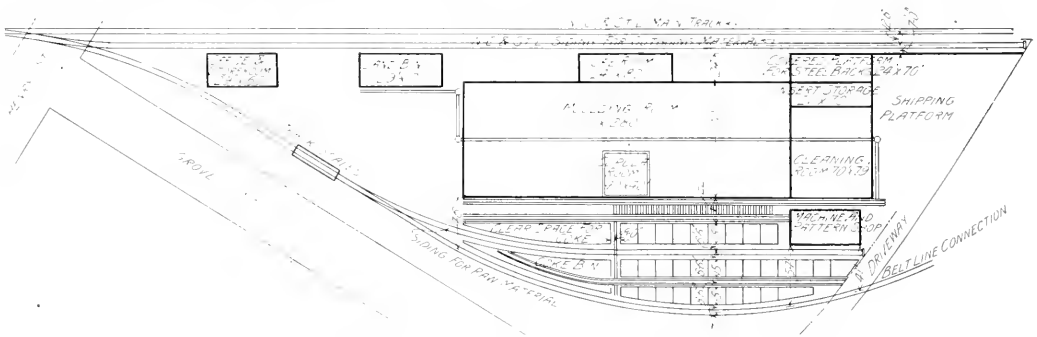
The American Brake Shoe & Foundry Company has plants for the manufacture of brakeshoes at Mahwah, N. J., Bloomfield, N. J., Cummings, N. J., Buffalo, Detroit, Chicago, Chicago Heights, St. Paul, St. Louis, Denver, Birmingham, Atlanta and Chattanooga, and recently has built a new foundry at Chattanooga, the general plan of which is shown in the accompanying engraving. The old plant at Chattanooga had a capacity of 50 tons daily, while the new plant has a capacity of 100 tons. The new foundry was planned and built under the direction of Elmer P. Snow, general superintendent of the American Brake Shoe & Foundry Company at Mahwah, N. J., and is operated under the superintendence of E. D. Herron.

The main foundry building is 100 by 350 feet. The roof is supported on wooden posts set on concrete column bases. The walls below the windows are brick and the rest of the structure is of wood and glass, the windows extending clear to the roof plate. The machine and pattern shop is 40 by 60 feet, the offices and storeroom is 40 by 60 feet and the core room, on the west side of the shop, is 25 by 60 feet. A large shipping platform at one end of the foundry is built on a level with the floors of box cars and provides means for loading the product at little expense. A 100-ton track scale is used for weighing the raw material as it enters the works. A complete bin system is used for storing the different kinds of metal for the cupolas. These bins are in three rows of 11 each and are 16 feet square and 10 feet deep.

Material is transferred about the plant on cars operating over depressed tracks; these cars are fitted with ball-bearing trucks, so that one man can push a load of 4,000 pounds. A ladle and truck running on a narrow-gauge track, parallel with the main building, is used to transfer metal from the cupolas to sulky ladles which are used for pouring the molds. The central transfer track in the foundry continues into the cleaning room, so that the products move directly from the molding room to the cleaning room. There are two cupolas of the Calumet type, the large one being 60 by 72 inches and the smaller one 48 by 60 inches. The molding is done entirely by machines and all the machinery is driven by electric motors, the power for which is furnished by the Chattanooga Electric Company. This company also supplies current for the arc lights.

The charging of the cupolas is done by means of chutes by which the metal is delivered into the cupola at small expense. The equipment in the cleaning room consists of 10 large tumbling barrels fitted with steel stays, a row of barrels being placed on each side of the central track, and the product is delivered to these barrels from cars standing on the tracks. The brakeshoes, after being cleaned, are delivered on small cars to the shipping platform. The principal product of the plant is locomotive brakeshoes and car brakeshoes with steel backs.

Railway connection is provided with the Nashville Chattanooga & St. Louis and the Chattanooga Belt Line. The coke supply comes from the Durham Coal & Coke Company, 16 miles south of Chattanooga. The cost of the new plant was about $45,000, which does not include considerable equipment which was brought over from the old shop.



Foundry of the American Brake Shoe & Foundry Company at Chattanooga, Tenn.—General Plan.

THE FIRE AND WATER RESISTING QUALITIES OF ELECTRICAL MACHINERY.

Electrical apparatus, when constructed in accordance with the best engineering practice, is well-nigh indestructible if subjected only to the ordinary amount of wear and tear, and often comes out with flying colors from the devastating reign of floods and fires. The few incidents quoted below are excellent examples of the amount of hard usage that well constructed electrical apparatus will survive, and still be in working condition.

In the Knights Deep Mine, near Johannesburg, South Africa, there were installed thirty-six 15-kilowatt transformers and twelve three-phase, 50 horsepower G.E. induction motors for operating the mine pumps. Through a peculiar combination of circumstances, the mine was allowed to fill with water, the motors and transformers remaining under several hundred feet of water for over two years.

When taken out three of the motors were rewound in the local repair shop. The others were simply dried out and then soaked in oil. Contrary to all expectations and to the surprise of all concerned the insulation was found to be in excellent condition, and the motors were put into service, apparently none the worse for their high-pressure bath. The transformers were treated in the same manner and shortly afterward they replaced several transformers of English make which had burned out only a short time after being installed.

A railway power station, situated near the Mississippi river, experienced a severe flood during the season of high water. Two 1,500-kilowatt 6,000-volt generators were more than half under water for nearly a week, but when dried out carried their load without giving any trouble whatever. In fact the first machine to be dried out carried the entire railway load until the second machine could be put into condition.

A 3-horsepower induction motor was taken from the ruins of the printing office of The Democrat, Ellsworth, Me., some few days after the entire building had been destroyed by fire. After being freed from the protecting coat of ice and cinders, the motor was dried and cleaned. When connected to the circuit it ran as smoothly as when first installed. Some idea of the intensity of the heat to which the motor was subjected may be gained from the fact that the switchboard and instruments were completely destroyed.

A G.E. 20-horsepower 550-volt three-phase induction motor, installed in a leather warehouse in Salem, Mass., was subjected to a severe ordeal during a fire. After the building and its contents had been deluged with water the motor was removed, and after being cleaned, dried and fitted with another pulley started immediately on application of the current. The motor has since carried its rated load and does not appear to be damaged in any way except as to appearance.

Another excellent example of the durability of the induction motor was shown by the remarkable performance of a G.E. 5-horsepower motor which was used in driving a pump in the G. H. Perry Company's quarry in South Dakota. The motor was often allowed to run without any attention over night, especially during the rainy season. One night a heavy rainstorm filled the quarry to such a height that the motor was half under water. When started the next morning it picked up its load and carried it steadily until the pit was emptied of water. On examination it was found to be none the worse for its prolonged bath, although a new pulley had to be put on in place of the old one, which was softened and warped out of shape.

Wanted — Electrical salesman who is selling to street railways to take important side line. J. W. Morrison, 29 Griswold St., Detroit, Mich.

Park superintendent wanted. State experience and salary wanted; also give references. Address "No. 561," care of Electric Railway Review, Chicago.

Superintendents, engineers, draftsmen, street railway, electrical, mechanical. Positions open. Write for free list and information, HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

BUSINESS OPPORTUNITIES

Exclusive sales agency wanted for Chicago and west for several street railway specialties. Appliances for cars only. Address "No. 556," care of Electric Railway Review, Chicago.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Don't throw away your old batteries. We have a preparation which will positively renew old dry batteries at the cost of two cents each. Trial package and electrical catalogue 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

Experienced salesmen, opening office in Washington, D. C., desire to make arrangements to represent manufacturers of standard specialties and supplies for electric railways and contractors. Southern territory. Address "No. 562," care of Electric Railway Review, Chicago.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of July 20, 1904, and June, 1906. State condition and price. Address "No. 567," care of Electric Railway Review, Chicago.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

If interested in any phase of steam transportation, you will find every development covered fully and accurately in The Railway Age. It is the leader and acknowledged authority in this field. Ask for free sample copies. The Railway Age, 160 Harrison Street, Chicago.

A copy of "The Motorman and His Duties," the standard handbook on the theory and practice of electric car operation, is worth many times its cost to every man interested in the subject. Send for 16-page pamphlet of sample pages. The Wilson Company, 160 Harrison Street, Chicago.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts added to, the interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

Subscription: Domestic . . $2
Foreign . . . $5
Canada . . . $3.50

Representatives of afternoon newspapers in Chicago made an organized attempt this week to prevent the Chicago City Railway from enforcing an order prohibiting the sale of newspapers on the new pay-as-you-enter cars. Under the guise of a newsboys' riot, but actually under the leadership of the circulation managers of evening papers, a crowd of carriers and adult hoodlums posing as their friends and sympathizers tried to board the pay-as-you-enter cars in the congested district during the evening rush hours. When refused admittance to the cars the gangs assaulted the conductors, pulled trolleys from the wires and caused blockades. The trouble lasted during the two evening hours when traffic is heaviest. One of the principal advantages assured to the public by the introduction of pay-as-you-enter cars is that the conductors on such cars do not force their way through aisles that may be crowded, jostling the passengers while collecting fares. To allow the newsboys to rush through the cars in heedless fashion would perpetuate the kind of discomfort that was caused by conductors under the old plan. The company is unquestionably maintaining its rights and doing its duty by passengers. Now that hostilities have been suspended pending the trial of the rioters who were arrested, it is to be hoped that the position of the company will be upheld.

Newsboys on Pay-As-You-Enter Cars.

In the circular published in another part of this issue the committees of the American Street and Interurban Railway Association emphasize the possibility that a large number of electric railways do not realize the great importance of the interstate commerce commission's tentative classification of operating expenses. This federal commission has jurisdiction over every electric and steam railway located in two or more states, and over every intrastate railway which engages, in connection with one or more other lines, in the transportation of persons or property in a continuous movement from a point in one state to another state. The system which the commission prescribes for electric railways the accounting methods of which it can control will probably be adopted by the authorities of 30 states, who have indicated their approval of the scheme. The complaint that the circular of the commission was issued so late that insufficient time is allowed for consideration of its provisions, is well founded. The delay was caused by the government printing office, which has been similarly slow in printing the various circulars issued in relation to the accounting system for steam roads. Every electric railway should avail itself of the opportunity to place before the interstate commission a criticism of the tentative classification. It is to be regretted that the commission has even tentatively set the gross earnings of those roads which will be permitted to use the abbreviated classification of operating expenses as low as $50,000. This figure is not approved by representatives of important commissions. William O. Seymour, a member of the Connecticut commission, suggested in the statement published in the Electric Railway Review for January 11, 1908, that only certain essential accounts should be required of roads with gross earnings of not exceeding $200,000 per annum. Thomas Yapp of Minnesota suggested $75,000 as the line of demarcation. The figure favored by Mr. Seymour appears exceedingly liberal in the light of the interstate commission's circular, but the limit should be set even higher if the mistake of saddling the roads with abnormally large accounting expense is to be avoided. Your opinion as to the proper figure should be sent to the interstate commission.

Circular Should be Answered.

The commutator is intrinsically the weakest part of all direct-current machinery. Brush and brush-holder troubles are often the causes of motor failures. In the long run it is probable that rough commutators are responsible for much of the trouble occurring at the brush-holder, though sometimes an inferior brush or a poorly adjusted spring will cause sparking. The best spring tension to use under definite conditions is a matter to be determined more by trial than by theory. Given a commutator with smooth, even bars it is safe to say that a wide range of brush-holder spring tension can be employed without undue arcing. The use of very low tensions on the springs tends to allow the brushes to be jarred off easily when a rough spot is met. As the tension is increased the brush holds closer to the bar, even in the face of irregularities. In many car houses the brush tensions are adjusted according to the personal judgment of the inspector, and there is no doubt that if all car houses were supplied with small spring balances and records kept of the most satisfactory brush tensions on different styles of motors, the present uncertainty of the proper tension to use that obtains in many cases would be largely done away with. A weekly inspection and cleaning of the brush-holder and the application of a little shellac is a precaution that will cost little and will tend to keep the holders in first-class condition. These features of maintenance are in themselves small matters, but when applied on a large scale they go a long way toward preventing the withdrawal of cars from service on account of motor failures.

Reducing Brush-Holder Troubles.

The street paving problem is a troublesome one for the railway and the municipality. A most important factor necessary for satisfactory paving between rails is the track substructure. Advancements in track construction methods and in the design of rail sections now places within the command of any railway company a track substructure which will withstand the severe loads imposed by heavy car and truck traffic. Given such a track substructure the engineer is next confronted with the task of choosing a paving material satisfactory to both the railway company and the municipality. For nearly a hundred years wood has been used for street paving and now the forest service of the United States department of agriculture is making extensive studies and many experiments with a view to determining the value of various woods and preservatives for wood paving. In the course of its studies the forest service has gathered data upon creosoted block pavements from nearly every city in the United States which has laid them and from those creosoting plants which treat wood paving blocks. The data

Wood Paved Streets.

thus obtained, together with the conclusions, are presented in a bulletin of the department. As yet the approved creosoted wood block pavements have not been down long enough to warrant the government engineers in making final conclusions, but by reading between the lines one learns that wood blocks treated with a well chosen preservative and properly laid afford a street surface which will outwear granite blocks. The comparative favorableness to travel of wood blocks and granite is so decidedly on the side of the wood block pavement that we may look to its more general adoption by municipalities

COMPENSATION PAYMENTS OF CHICAGO ELEVATED LOOP.

The earnings from operation of the Chicago Elevated loop are derived almost entirely from the lessees under the unique provisions of the lease whereby the loop is the principal central business district terminal for four elevated railway systems extending into the outlying sections of the city. The leases with the Union Elevated Railroad Company, the property and stock of which have been acquired by the Northwestern Elevated Railroad, provide that each of the four lessees shall pay to the lessor, the Union Elevated company, ½ of 1 cent for every paying passenger carried on its lines without regard to whether the passengers ride on the loop structure or not. In addition to the payments as rentals under this provision, the four companies, the Northwestern Elevated Railroad, the Metropolitan West Side Elevated Railway, the Chicago & Oak Park Elevated Railroad (the reorganized Lake Street Elevated Railroad) and the South Side Elevated Railroad, are required to pay large expenses of maintenance and operation. The lease, which was executed on December 19, 1904, is explicit in its stipulations concerning these expenses. A power house furnishes power for the operation of the trains on the loop, and the lessees must pay the entire cost of the "maintenance, renewals, repairs and operation, including the taxes, assessments, insurance and ground rent," not only of the power house itself, but also for its apparatus, machinery and connections. The lessees also agree to pay the entire cost of "maintenance, insurance, renewals, repairs and operation of the tracks, ties, switches, signals and signal towers," and the cost of the operation of stations. The expenses of taxes, assessments, maintenance, repairs and renewals of the structure proper and the stations are to be borne by the lessor. The lessees are not to be charged with the compensation to the city or with claims or judgments for damages to abutting or adjoining property.

The loop structure comprises 20,900 feet of single track. The outstanding bonds on the property are about equal to the amount of outstanding stock, $5,000,000. This stock was purchased in 1901 at $125 a share, or a total of $6,250,000, by the Northwestern Elevated Railroad, which later absorbed the loop property. To meet the capital expenditure necessitated by this investment, the Northwestern company issued its 4 per cent first mortgage and refunding bonds.

The 50-year franchise under which the loop of Chicago is operated provides for an annual distribution of earnings with the city of Chicago after provision is made for the interest on about $5,000,000 of first mortgage 5 per cent bonds. During the five years beginning on January 1, 1897, there was paid annually to the city, after provision had been made for this bond interest, but before any allowance was made for the expenses not borne by the lessees, 5 per cent of the earnings. During the ensuing period of five years, the compensation was increased to 10 per cent per annum. During the 10-year term which began on January 1, 1907, the city is to receive 15 per cent annually. In the 15-year term beginning on January 1, 1917, the rate is to be 20 per cent per annum, and for the remainder of the term the city is to receive 25 per cent per annum upon the conditions stated

Under this compensation feature of the ordinance the city has just received the first payment at the 15 per cent rate. It amounted to $71,028.44, a much larger sum than has been paid in any preceding year. Payments of compensation since the operation of the loop was begun aggregate $271,903.19, as follows:

Year.	Per cent.	Compensation.	Totals.
1898	5	$ 4,956.45	
1899	5	7,196.97	
1900	5	9,142.87	
1901	5	11,402.07	
			$ 32,698.36
1902	10	$28,258.03	
1903	10	32,436.84	
1904	10	31,943.71	
1905	10	36,114.08	
1906	10	39,423.73	
			168,176.39
1907	15	$71,028.44	71,028.44
			$271,903.19

The payment of $71,028.44 as compensation for 1907 indicates net earnings for the company, after the payment of bond interest, of about $473,523. From this sum, however, the company had to meet the expenses accruing under the terms of the lease, the extent of which, although unknown, must be large. Subject to these expenses, earnings before deduction of the bond interest were about $723,523.

There is no reason to doubt that the return on this investment will grow much larger as the density of traffic on the loop continues to increase. The loop is in the remarkable position of receiving revenue from passengers carried by lessee roads into stub terminals. The Metropolitan Elevated, the Chicago & Oak Park Elevated and the South Side Elevated roads have stub terminals which accommodate part of their traffic during rush hours.

The terminal expense which must be borne by the lessee roads on account of their lease with the loop company is 10 per cent of their gross passenger earnings plus the additional expenses outlined. In 1907 the total loop rental and expenses paid by the South Side Elevated road amounted to 14.5 per cent of its gross passenger earnings; with the Metropolitan road the expense was 14.6 per cent. While this seems large, it is evident that without the terminal facilities which the loop provides the elevated railways would be seriously hampered. It is necessary for urban street railways to have terminal facilities in the heart of the business district. Such terminal facilities must be provided, even if the expense is large.

Although the franchise under which the Union Elevated loop is operated is for 50 years, the lease with the tenant companies is to last so long as the loop shall be permitted to be maintained under existing ordinances or under any other legal authority which may hereafter exist. Because of the importance of the loop to the people who depend upon its facilities, it may be assumed that the structure will remain standing under a new franchise providing for a continuance of the profit-sharing arrangement, which will yield much more to the city as time passes. It may also be assumed that the Northwestern company, which owns the loop, will not admit the inadequacy of the loop until many radical changes in operation have been made with the object of facilitating the operation of trains. Changes which this company deems desirable now were outlined in the report of Ford, Bacon & Davis, published in the Electric Railway Review of February 29, 1908, page 268.

The compensation paid to the city is wholly a charge upon the earnings from the loop proper. The compensation is not a tax upon the operating railways, unless it be considered that in the computation of the rental of ½ of 1 cent a passenger, when the terms of the lease were originally settled, allowance was made with the idea that the payment should be virtually redistributed from the lessor to the lessee companies.

ANNUAL REPORTS.

Toronto Railway Company.

Gross earnings of the Toronto Railway Company increased 12.9 per cent in 1907 over 1906, operating expenses increased 15 per cent and net earnings gained 10.6 per cent. The increase in operating expenses is due principally to an advance in wages of employes made last June. The figures for three years compare as follows:

	1907.	1906.	1905.
Gross earnings	$3,511,197	$3,109,740	$2,747,324
Operating expenses	1,893,236	1,646,515	1,560,437
Net earnings	$1,617,961	$1,463,225	$1,186,887
Taxes, charges, etc.	721,802	647,129	544,303
Net divisible income	$ 896,159	$ 816,096	$ 642,584
Dividends	473,378	460,241	350,000
Surplus	$ 422,781	$ 355,855	$ 292,584
Special appropriations	125,000	100,000	50,000
Surplus	$ 297,781	$ 255,855	$ 242,584
Operating expenses—per cent of gross earnings	53.9	52.9	56.8

The taxes, charges, etc., for 1907 as shown in the foregoing, included payments to the city of Toronto for taxes, percentage payments under franchise and pavement charges aggregating $542,091, an increase of $74,725 over the corresponding payments during the previous year. These payments equaled the large proportion of 15.4 per cent of the gross earnings or 33.5 per cent of the net earnings. This is a heavy tax upon the revenue of the company. Since the railway began to operate under its franchise it has paid to the city a total of $3,982,826 for taxes, compensation and paving charges.

In his report William Mackenzie, the president, states that comparatively few extensions were built on account of the opposition of the city council. Important litigation with the city was decided during the year in the favor of the company. The express business, although confined to lines operating over 28 miles of track yielded gross earnings of $33,896, and will be extended.

There was expended for "extensions, additions and betterments" $536,388, chiefly for the following purposes: Lands and properties, the purchase of which was deemed advisable to provide adequately for the future growth of the company; continuing the installation of underground cable connecting the substations and power house; completing 40 cars and for the first lot of 100 pay-as-you-enter cars; and in track extensions. The company operates 78 miles of track.

The cost of "road and equipment, real estate and buildings, including pavements," etc., was stated as of December 31, 1907, at $13,541,020 as compared with $13,104,632 at the close of the previous year. The stock was unchanged at $8,000,000 and the outstanding bonds stood at $3,613,373, the same as at the conclusion of the preceding year. Bills payable aggregated $137,160.

The figures of passengers carried compare as follows:

	1907.	1906.	1905.
Passengers carried	85,574,788	76,958,488	67,881,688
Transfers	31,370,825	28,159,558	23,625,752

Mr. Mackenzie says that the legal department "had a particularly successful year in cases arising from injuries and damages claims, having won 15 out of 22 cases tried in the high court."

Consumption of Copper.

An interesting government estimate has been made showing that the use of copper in 1906 for electrical purposes was practically half the consumption; brass manufacturers used 30 per cent; in rolling mills and the manufacture of sheet copper 5 per cent were used, and for miscellaneous uses, principally castings, 15 per cent.—Steam.

Communications

THE TENTATIVE CLASSIFICATION OF OPERATING EXPENSES.

To the Editors:

Although it has been understood generally that the interstate commerce commission desired to have the primary accounts of the classification of operating expenses for electric railways correspond so far as possible to the accounts prescribed for steam railways, the tentative classification submitted differs from the steam railway classification in many places where it would be preferable to have the accounts conform more closely to the similar accounts in the steam railway classification.

In the general account "maintenance of way and structures," the classification prescribed by the interstate commerce commission for steam railways, effective on July 1, 1907, shows account No. 1 as "superintendence." As this account is very important, it should undoubtedly be given a place in the primary accounts, but in the tentative classification the expense of "superintendence" is included in account No. 15, "other maintenance of way expenses"; account No. 24, "miscellaneous electric line expenses," and account No. 32, "miscellaneous buildings and structures expenses." The plan outlined subdivides this expense between the various subheadings of "maintenance of way and structures," which does not seem desirable.

Primary accounts are set up as follows: No. 3, "rails"; No. 4, "rail fastenings"; No. 5, "frogs, switches and special work." Why it is necessary to make these separate primary accounts is not clear. The classification for steam roads provides only two primary accounts, "rails" and "other track material," which appear ample for the purpose.

It will be observed that "stationery and printing" is included in account No. 15, "other maintenance of way expenses"; account No. 24, "miscellaneous electric line expenses"; and account No. 32, "miscellaneous buildings and structures expenses." Instead of the subdivision of this expense, a single primary account, "stationery and printing," under "maintenance of way and structures," would appear to be desirable.

In account No. 15, "other maintenance of way expenses," and account No. 24, "miscellaneous electric line expenses," the cost of "injuries to persons" is included, and in addition this expense is assigned a primary account, No. 42. The one primary account "injuries to persons" under "maintenance of way and structures" should be sufficient for all charges in connection with this item. A separate account, No. 39, is shown for "care of track," which appears to be superfluous when proper consideration is given to account No. 8, "roadway and track"; account No. 41, "cleaning, sprinkling and oiling roadbed"; and account No. 43, "other miscellaneous maintenance expenses."

In the general account, "maintenance of equipment," provision is made for "superintendence" in account No. 63, "other equipment expenditures." Under this same account provision is made for stationery and printing, insurance and injuries to persons. It would seem desirable that these items should be given primary account numbers instead of being included under one general head whereby their identity is lost.

Regarding accounts Nos. 47 and 48, it is not clear why a distinction should be made between passenger cars and combination cars, as both classes of cars are used for passenger service. The steam railway classification, which provides one account for passenger train cars, is preferable, particularly as the wages of motormen and conductors operating cars of these classes are not separated in the tentative classification. Separate accounts are set up for "express cars," No. 49,

and "freight cars," No. 51. It will be impossible for some railways to make a distinction between express cars and freight cars, as the same cars are used for both purposes and are interchanged. It is not clear, either, why a separation should be made in the maintenance of these two classes of cars when the wages of motormen and conductors are not separated between freight and express.

Provision is made for the maintenance of locomotives in account No. 52. It does not appear that the classification makes proper allowance either for present conditions or for changes which time is rapidly bringing about. The account does not specify whether electric or steam locomotives are covered. It would seem desirable to separate the different classes, which, of course, could be done by making subdivisions of the accounts, as "a" and "b."

To accounts Nos. 53 and 54 the same criticism as to accounts Nos. 47 and 48 would apply. Concerning accounts Nos. 45 and 57, the same criticism as to accounts Nos. 49 and 51 is justified.

The classification of "traffic expenses" in the steam railway system would be more satisfactory than the accounts in the tentative electric railway classification. The importance of giving "superintendence" a primary account should again be emphasized under this general account. "Superintendence" should be separated from the expenses of outside agencies, as it is very important to separate the expenses of administration from expenditures made strictly for soliciting by an outside agency; and it would appear that "stationery and printing" should have a primary account instead of being included in account No. 72, "traffic supplies and expenses."

"Superintendence," account No. 88, includes in the tentative classification the dispatching of trains, an expense which, it appears, is of sufficient importance to be entitled to a primary account number.

"Express service" is shown as account No. 98. In view of the fact that the compensation of certain employes might be divided between this account and other operating accounts, it is not plain how amounts to be charged to this account should be ascertained. If it is desired to show the expenditures on account of express service separately, some basis of apportioning the expenses between the proper accounts may be selected, if "express service" is interpreted to mean simply wagon service, picking up shipments of express and delivering them at destination.

Primary account numbers are given to "superintendence," "insurance," "injuries to persons" and "stationery and printing" under both "transportation expenses" and "general expenses." This would make it desirable to give such items primary account numbers under "maintenance of way and structures" and "maintenance of equipment," instead of carrying them in "miscellaneous expenses" under those two general accounts.

It does not appear that the clearing accounts are necessary in the classification of the operating expenses of electric roads. These accounts do not seem to be used in the steam railway classification.

Although the method suggested for accounting for the various "joint facilities" accounts is different from that which has been followed generally by electric railways, such accounts could undoubtedly be handled as the interstate commerce commission appears to desire. The accounts seem to be outlined in the same manner as in the steam railway classification.

An objectionable feature of the classification is the large number of primary accounts. Heretofore electric roads have never used so many primary accounts in their classifications of operating expenses. In addition to the other changes which appear desirable, I am inclined to believe that the accounts assigned to "maintenance of electric lines," eight in number, might with advantage be reduced to three primary accounts, as follows: "High tension transmission lines," "distribution system" and "conductors." Instead of using seven primary accounts for "maintenance of buildings and structures," as shown in the tentative classification, the expenditures could be shown in one or two primary accounts. Instead of separate primary accounts covering passenger, combination and mail cars, the expenditures for these cars could be carried in one account, and as it is not feasible or desirable for many roads to separate the expenses on account of freight and express cars those expenses should be combined.

In brief, in my opinion the number of accounts should be reduced as indicated and the additional primary accounts, namely, "superintendence," "insurance," "injuries to persons," and "stationery and printing," should be added under the general accounts, "maintenance of way and structures" and "maintenance of equipment."

With these changes, it would appear that the tentative classification should prove satisfactory to interurban electric railway lines, and if any further changes are made it is hoped that the interstate commerce commission will make these changes with a view to conforming more closely to the steam railroad classification and not diverging from it, as several items in the tentative classification would indicate has been done. AUDITOR.

QUARTERLY MEETING OF THE NEW YORK STATE ASSOCIATION.

The Street Railway Association of the State of New York held its regular quarterly meeting in the commodious rooms of the Ft. Orange Club at Albany on March 18.

The meeting was an executive session and was devoted almost entirely to a discussion of the interstate commerce commission's tentative classification of operating expense accounts. A committee was appointed to study the proposed system and formulate a report in the form of a resolution, which will be presented to the public service commission of New York, second district, and to the interstate commission. A meeting of this committee will be held on March 23 at Buffalo, in the office of T. W. Wilson, president of the association. This committee is as follows:

Henry J. Pierce, president International Railway Company, Buffalo.

Edgar S. Fassett, general manager United Traction Company, Albany.

C. Loomis Allen, vice-president and general manager Syracuse Rapid Transit Company and Utica & Mohawk Valley Railway.

A. L. Linn, Jr., general auditor Mohawk Valley Company.

J. C. Collins, secretary and auditor Rochester Railway.

H. M. Beardsley, secretary and treasurer Elmira Water Light & Railroad Company.

A short discussion took place concerning the merits of a bill before the legislature making it necessary for a conductor to have a license. The bill was read in part before the meeting and was found to contain clauses unfair to the railways and destructive to good service. In case the bill becomes a law as it now stands it will be necessary for an applicant for the position of conductor to be a resident of the state one year prior to the time of his application for a conductor's license and then to have 30 days' actual experience over all the lines of the system on which he is to work. The following committee was appointed to represent the association at a hearing regarding the bill on the afternoon of that day: Daniel M. Beach, Rochester Railway; W. W. Cole, Elmira Water Light & Railroad Company; Mr. Norton.

The following attended the meeting:

Albany—Edgar S. Fassett, general manager, Arthur J. Gies, auditor, United Traction Company.

Albion—J. M. Campbell, Buffalo Lockport & Rochester Railway.

Buffalo—Edward H. Stichel, general auditor Buffalo & Lake Erie Traction Company; H. J. Pierce, president, T. W. Wilson, general manager, D. M. Deininger, auditor, Morris Cohan, Jr., International Railway Company.

Cortland—G. H. Garrison, secretary Cortland County Traction Company.

Elmira—W. W. Cole, vice-president and general manager Elmira Water Light & Railroad Company.

Gloversville—W. H. Collins, general superintendent,

George A. Harris, general auditor, Fonda Johnstown & Gloversville Railroad.

Kingston—C. Gordon Reel, vice-president and general manager Kingston Consolidated Railroad.

Newark—R. A. Dyer, Jr., assistant general manager Rochester Syracuse & Eastern Railroad and Auburn & Syracuse Electric Railroad.

New York City—A. L. Linn, Jr., general auditor, F. B. Lasher, traveling auditor, Mohawk Valley Company; Joseph K. Choate, assistant to president Oneonta & Mohawk Valley Railroad; T. B. Bradley, auditor Richmond Light & Railroad, Staten Island Midland Railroad (borough of Richmond); J. H. Pardee, managing director J. G. White & Co.; James Marwick, chartered accountant International Traction Company.

Oneonta—W. C. Austin, auditor Oneonta & Mohawk Valley Railroad.

Poughkeepsie—J. W. Hinkley, Jr., president Poughkeepsie City & Wappingers Falls Electric Railway.

Rochester—E. J. Cook, general manager, J. Clarence Collins, secretary and auditor, Rochester Railway; Daniel M. Beach.

Schenectady—E. F. Peck, general manager, D. C. Dibbell, auditor, Schenectady Railway.

Syracuse—J. M. Joel, auditor, C. Loomis Allen, vice-president and general manager, Syracuse Rapid Transit Railway and Utica & Mohawk Valley Railway.

At a meeting of the executive committee on March 17 it was decided to hold the next annual meeting of the association at Niagara Falls on June 30 and July 1. The annual banquet will be held on the evening of June 30.

ASSOCIATION CIRCULAR ON CLASSIFICATION OF OPERATING EXPENSES.

A circular letter concerning the tentative classification of operating expenses has been addressed to the presidents of electric railways of the United States by George H. Harries, chairman of the American Street and Interurban Railway Association committee on "Classification," and W. F. Ham, chairman of the American Street and Interurban Railway Accountants' Association committee on "Classification." The letter, of which an abstract follows, is headed "Urgently Important":

Importance of the Classification.

In view of the possibility that a large number of the street and interurban railway companies have not realized the great importance of the tentative classification of accounts set forth in Circular No. 20, recently distributed by the interstate commerce commission, the special committees of the American and the Accountants' associations urge your active interest in this matter at this time.

It should be clearly understood that the proposed classification will, when it becomes effective, govern the accounts of practically every electric railway in the country; directly where the roads do interstate business and indirectly where state commissions follow the orders, rulings and methods of the federal commission—a condition which the federal commission expects soon to exist. It is therefore imperative that all companies furnish the interstate commerce commission (and this association, in duplicate) with criticisms or opinions as to the tentative classification.

Conceding the difficulty of anything like complete dissection or discussion of the classification within the time limit, it is undoubtedly practicable for you to select and comment upon those features of the scheme of which you approve or disapprove. Should there be primary accounts which you deem unnecessary, or should the grouping be out of accord with practice which experience has shown to be valuable or essential, it is most desirable that the facts be now presented, to the end that the expressed desires of the federal and state authorities harmonize, as nearly as may be, with the business needs of the electric carriers.

In this work, whether it be much or little, and regardless of the size of your company, the committees beg your earnest and prompt co-operation; without which nothing good can be accomplished. The information requested should be furnished promptly, the date set by the interstate commerce commission being March 28. If you find it impossible or impracticable to digest the circular by that day we shall appreciate notification to that effect, together with a statement as to the probable date when your answers will be forwarded.

It is suggested, in order to develop the practicability and application of the proposed classification to the electric railway industry, that each company subdivide its 1907 operating expenses among the proposed accounts, in as approximate an estimate as time and convenience will permit.

Several companies represented upon your committees have already made such approximate estimates in a short time, and the results appear to be of great practical value.

To this end there is inclosed, in triplicate, data sheet No. 26, for this operating expense classification, which also contains the form for questions of the commission. Please fill out and send one copy to Prof. Henry C. Adams, in charge of statistics and accounts, interstate commerce commission, Washington, D. C., and one copy to B. V. Swenson, secretary American Street and Interurban Railway Association, New York, N. Y.

The Data Sheet.

The data sheet inclosed with the circular contains both the abbreviated and the tentative classifications of operating expenses, published in the Electric Railway Review of February 29, 1908. The percentage of total operating expenses charged to each primary account is desired. The abbreviated classification is to be used by companies with annual gross revenue of less than $50,000 and the amplified classification by companies with annual gross revenue of $50,000 or over. The data sheet also contains a list of questions submitted by the interstate commerce commission in its circular and states: "It is not intended that the answers made to this inquiry should be confined to the specific questions enumerated; on the contrary, any criticisms and suggestions pointing to the improvement of the classifications are invited." Information is desired upon the following points:

Name of company; number of miles of line operated; number of cars operated under normal conditions. Do you favor dividing electric lines into two classes, as outlined in this circular? What limit, in your opinion, should be used as a line of demarcation indicating the distinction between a large and a small company? What was the gross revenue of your company as shown in its last annual report? What is the present surplus (or deficit) from operation of your company, and in what particular years did it accumulate? Please give a list of joint facilities involved in the operations of your company. [See accounts Nos. 45, 46, 66, 67, 104, 105, 115 and 116, Electric Railway Review of February 29, 1908, page 267.—Eds.] Do you consider the principles involved in the joint facility accounts as applicable to electric railway carriers?

General criticisms are also invited regarding the classification.

SOUTHWESTERN ELECTRICAL AND GAS ASSOCIATION.

H. T. Edgar, president, Ft. Worth, Tex., announces that the next annual convention of the Southwestern Electrical and Gas Association will be held in El Paso, Tex., on May 7, 8 and 9. Arrangements have been made for the following papers to be read:

"Wood Preserving," by Prof. E. P. Schoch, University of Texas.

"Track Construction," by Mark Lowd, Dallas, Tex.

"Gas Engines and Producers," by W. B. Tuttle, San Antonio, Tex.

"Various Forms of Electrical Illumination, and their Efficiency," by C. W. Kellog, Jr., El Paso, Tex.

"Gas Meters," by A. J. Myler, Jr., Dallas, Tex.

A general discussion will be held on the question "What Policy Should be Pursued by Public Service Corporations in Making Extensions?" H. S. Cooper, manager of the Galveston Electric Company, and Frank E. Scoville, general manager of the Laredo Electric & Railway Company, have been appointed to lead the discussion for the street railway companies. The complete programme of the different sessions and of the entertainments will be announced later.

The St. Regis hotel has been selected as the headquarters of the association for the convention. The rates are: For rooms without bath, $1.50 per day; for rooms with bath, $2.00 to $3.00 per day, on the European plan. The hotel has offered ample facilities to the supply men for exhibition purposes and arrangements have been made with the El Paso Electric Railway to furnish current for the exhibits.

R. B. Stichter, 609 Juanita building, Dallas, is secretary of the association.

THE CHICAGO & SOUTHERN TRACTION COMPANY.

BY D. C. HINSTORFF

Through service between Chicago and Kankakee was begun on October 5, 1907, by the Chicago & Southern Traction Company, thereby establishing a connecting link for the proposed Chicago-St. Louis and Chicago-Indianapolis trolley routes.

Chicago & Southern—Typical Roadway, Bridge and Overhead Construction.

The main line of the new road extends from Seventy-ninth and Halsted streets, Chicago, to the heart of Kankakee, a distance of 51.64 miles, and serves the towns of Blue Island, Harvey, Chicago Heights, Steger, Crete, Monee, Peotone, Manteno, Tucker and Bradley. A storage battery line owned and operated by the Chicago Electric Traction Company from Chicago to Harvey, a distance of 12 miles, with branch lines to Morgan Park and Calumet Grove, was the beginning of this promising interurban system. The equipment consisted of single-truck motor cars and trailers, mounted on Dupont trucks, which were constructed with a long wheel base in order to allow ample room for carrying the storage cells. A train made up of a gasoline-electric motor car and trailers was operated on the Calumet Grove branch for handling picnic parties to and from a park at the terminus of that line. Proving itself expensive and unpractical under conditions existing at that time, the storage battery system was changed to the overhead trolley system.

The property of the Chicago Electric Traction Company was acquired by the Chicago & Southern Traction Company in order to give the latter road an entrance into Chicago over its own tracks. The Southern company, together with the Detroit & Toledo Construction Company, built that portion of the line from Harvey to Kankakee, a distance of 40 miles, besides making extensive improvements on the original line.

The terminal facilities of the road are excellent. At Seventy-ninth and Halsted streets direct connections are made with two trunk lines of the Chicago City Railway Company to the business center, while a spur from the main line at Eighty-first street to Sixty-third street and South Park avenue, where the "White City," the largest amusement park in Chicago, is located, connects with the South Side Elevated Railroad and suburban and interurban lines to points south and southeast.

The Kankakee terminal is centrally located and is likewise the terminus for all the lines of the two local systems radiating from that point. Eventually interurban lines may be built from Kankakee to Lafayette, Ind., and Champaign, Ill., connecting with the Indianapolis & Northwestern Traction Company and Illinois Traction System, respectively. The new road runs through a rich farming country and serves a population of approximately 85,000 outside of the Chicago city limits. Numerous industries are located along the line, one town alone, Chicago Heights, having 47 manufacturing establishments.

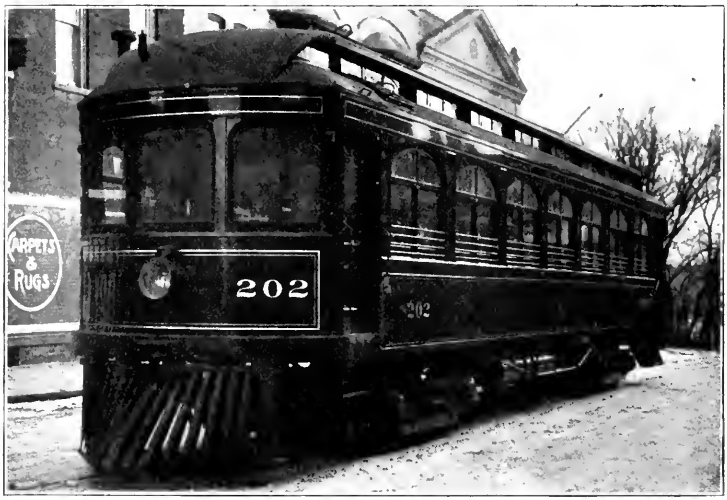
A large tract of land, lying about midway between the termini, has been purchased and will be converted into a pleasure park. An abundance of shade trees, deep ravines, a lake and flowing stream make it a most picturesque spot.

Five cemeteries are reached by the Morgan Park branch, which gives the company considerable funeral traffic. One funeral alone has required as high as 23 cars, while others were handled with not less than 10 cars. Statistics show that during the past year the three oldest of these cemeteries had a burial average of 14 per day. It is the intention to add three more funeral cars to the present equipment.

Track and Roadway.

Outside of towns the road is built on private right of way, 50 feet wide, inclosed in American Steel & Wire Company's large mesh fencing, with wooden cattleguards and wing fences at highway crossings. Tangents 10 miles in length and shorter ones, connected by high-speed curves, with a comparatively level track, give the road an exceptional opportunity for limited service, which it proposes to operate in the near future. The maximum grade is 1 per cent, the deepest cut about seven feet, and the highest fill comes close to the same measurement.

Seventy-pound Pennsylvania Steel Company's T-rails are



Chicago & Southern—Single-Ended Interurban Car.

laid on chestnut ties and 6 to 8 inch stone ballast from the company's own quarry. The rails are connected with 4-hole continuous rail joints and bonded with American Steel & Wire Company's pin-driven rail bonds. The highways are paved to the height of the rail with crushed rock and a single plank outside of each rail. This method of construction was found to be a decided improvement over the all-plank crossing, as the latter causes considerable annoyance during the winter months, due to the heaving of the planks. The sidings are of the through and stub types. The stub sidings will later be continued and built through. Ys are located at convenient

Chicago & Southern—Interior Blue Island Substation.

points along the line to facilitate reversing the single-end cars as called for by the schedule and in cases of emergence.

Below Peotone the road runs underneath the Illinois Iowa & Minnesota Railway through a concrete subway. All grade crossings are protected with Buda derails. The largest bridge on the line is below Manteno. It is of steel construction, 100 feet in length, and rests on concrete abutments.

On city streets, with practically all double-track construction, 80-pound Lorain girder rails are laid with tieplate braces on every tie. The girder rails are connected with 4-hole Atlas rail joints and bonded with "protected" rail bonds, furnished by the Electric Service Supplies Company. Buda spring switches and switchstands are used throughout the line.

The overhead material, which was furnished by the Ohio Brass Company, is supported by 35-foot Idaho cedar poles, with 14-inch bottoms and 8-inch tops, placed 110 feet apart. In Blue Island and Harvey steel poles have been erected.

Over single track two parallel No. 00 grooved trolley wires are hung on twin hangers from 9-foot Richmond flexible side brackets with ¼-inch and ⅜-inch strand. Side pole span suspension is employed over double tracks with the same gauge trolley and span wires and single straight-line hangers.

The transmission lines, consisting of three No. 4 copper wires each, are carried on 100,000-volt double-petticoat high-tension insulators mounted on steel pins. One wire runs along the top of the pole and the other two are supported on 4 by 6 inch by 7-foot wood crossarms, which are braced with galvanized iron angle bars about 8 feet above the 2 by 4 inch by 4-foot crossarms supporting the telephone lines and 500,000-circular-mil feeders. Lightning protection is afforded by Garton lightning arresters, distributed five to a mile.

Power.

Power is purchased from the Blue Island plant of the Commonwealth Edison Company. Three-phase 25-cycle current is distributed at 9,000 volts to substations located at Blue Island and Eighty-eighth street and Vincennes road, Chicago, and at 33,000 volts to the Chicago Heights, Monee and Bradley substations. The company in turn sells current to the Chicago Heights street railway, North Kankakee street railway and the Peotone Lighting Company, whose consumers use induction motors exclusively for manufacturing purposes. A lower potential was adopted for the Chicago and Blue Island transmission lines on account of running through a densely populated territory.

Substations.

The substation buildings are of brick, with concrete foundations, concrete floors and tile roofing. When fully completed the Chicago Heights substation will have a waiting room, ticket office and baggage room, in addition to the operating room and high-tension chamber. The floor plan illustrates the general layout of the station.

The Blue Island substation, an interior view of which is shown, has two 500-kilowatt 600-volt rotary converters, fed by six 185-kilowatt oil-cooled transformers, which step down the alternating-current voltage to 430 volts. Each of the other substations has one rotary and three transformers, but is built large enough to house a duplicate equipment. The negative side of the rotaries is connected with the track rails by four 300,000-circular-mil cables. All electrical apparatus is of General Electric manufacture.

Rolling Stock.

The passenger rolling stock consists of 10 double-truck interurban cars, 15 double-truck city and suburban cars, 15 single-truck closed motor cars, 25 single-truck 10-bench open motor cars, 15 single-truck 10-bench open trailers and 1 funeral car.

A McGuire-Cummings sweeper, a Dupont snow plow and two work cars, equipped with air operated nose plows, consti-

Chicago & Southern—Combination Work Car, Snow Plow and Ballast Spreader.

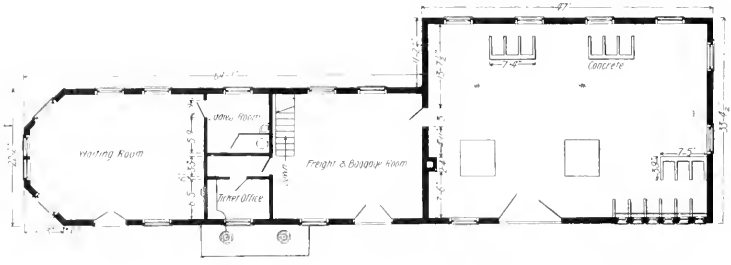
tute the snow fighting equipment. The work cars have a cab at one end and are mounted on St. Louis Car Company's No. 23A M. C. B. trucks. They are equipped with L-4 controllers, Westinghouse straight and automatic air brakes. A Baldwin type switching locomotive, 7 flat cars and 32 center dump cars make up the balance of the miscellaneous equipment.

The interurban cars are of the single-end vestibule type with smoking compartment, and were built by the St. Louis Car Company. The dimensions are as follows: Length over bumpers, 51 feet; length of the regular passenger compartment, 28 feet 8 inches inside; length of the smoking com-

partment, 11 feet 2½ inches inside; width of car, 8 feet 6 inches over all; height of car from rail to top of roof, 13 feet 2 inches; truck centers, 27 feet 6 inches.

The frames are of semi-steel construction, trussed by two truss rods 1⅛ inches in diameter with upset ends. The sills are composite and consist of yellow pine 5 by 8 inches, reinforced on the inside by 6-inch 8-pound channels. The center sills are of 6-inch I-beams with yellow pine fillers and the intermediate sills are of 4½ by 6 inch yellow pine.

The needle beams are of 5-inch I-beams trussed. The sides of the cars are constructed with ash posts and casings and are covered with narrow beaded poplar. The letter boards also are of poplar. There are seven double windows on each side of the car. The lower sashes are arranged to raise and are glazed with plate glass. The upper sashes are of Gothic



Chicago & Southern—Floor Plan, Combination Passenger Depot and Substation.

design and extend over the lower sashes. Mahogany interior finish and full empire ceiling painted a dark red, together with oxidized trimmings and high back, head roll, reversible seats upholstered in brown plush, give the car a handsome appearance. The seats in the smoking compartment are upholstered in black leather. Each car is equipped with drinking water and toilet room with dry hopper.

The cars are equipped with wood body pilots, Radiant No. 2 hot water heaters, arc headlights, parcel racks, whistles and gongs, and are mounted on St. Louis Car Company's M. C. B. high-speed forged steel trucks. The cars have four G.E.-74 motor equipments, type M control, Westinghouse straight and automatic air hand brakes, air sanders and trolley retrievers.

The city and suburban cars were built by the G. C. Kuhlman Car Company and are of the single-end semi-convertible type with smoking and passenger compartments and Detroit platforms. A steam coach roof is at the forward end. The motorman's cab takes up about two-thirds of the front vestibule and contains a Radiant No. 1 hot water heater in addition to the control equipment. There are 18 transverse seats with stationary backs and four longitudinal seats in each car, all upholstered in spring rattan. The ceilings are painted a dark green. A single sliding door opens into the smoking compartment from the front vestibule, a double sliding door leads from the passenger compartment to the rear platform and a partition and single swinging door separate the compartments. The cars are mounted on Brill No. 27 FE1 trucks with 4-foot 6-inch wheel base. The cars are equipped with 4-motor equipments, McGann storage air brakes, Peacock hand brakes, Ham air sanders, arc headlights, electric markers and Knutson trolley retrievers.

Car House and Shops.

The car house and shops are located at Eighty-eighth street and Vincennes road, Chicago. The building is at the present time in process of reconstruction. When completed each track will have an inspection pit and will lead out of the building independently. Air supply for cleaning purposes will be available at all tracks. The shops will be fully equipped with a wheel press, drill press, wheel and machinists' lathes and other machinery and tools necessary for maintaining the rolling stock in operative condition. The offices, which are located in the same building, will be enlarged and employes' club rooms and other conveniences will be added.

Operating Features.

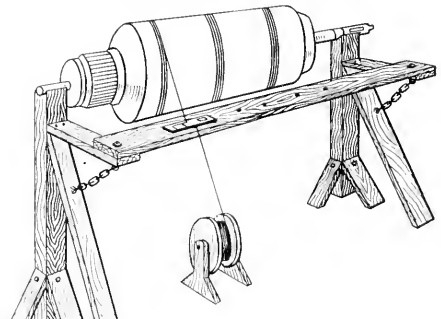
In addition to a frequent local service, the present schedule provides a headway of 15 minutes to Blue Island, 30 minutes to Crete and 90 minutes to Kankakee. An hourly headway between Chicago and Kankakee will take the place of the present schedule in the spring.

A telephone dispatching system is used, the dispatchers' headquarters being at Harvey. Telephone booths with automatic cutouts, operated by the movement of the door, are located at all sidings, Ys, junctions and termini. Instruments are wall sets of Stromberg-Carlson make.

The personnel of the Chicago & Southern Traction Company executive and operating staff is as follows: Matthew Slush, president; C. J. Reilly, secretary and treasurer, Detroit, Mich.; W. H. Conrad, general manager; V. R. Ronk, auditor; J. E. Cooke, cashier; Charles Oldenburg, claim agent; J. P. Naumes, superintendent of transportation; E. E. Youngs, master mechanic; A. J. Law, superintendent of construction; R. J. Bell, electrician; R. W. Renton, chief engineer, Chicago.

ARMATURE BANDING DEVICE.

Small roads having few cars cannot afford expensive equipment in their repair shops. The St. Francois County Railway, Farmington, Mo., is such a road, and J. L. Sullivan,



Simple Device for Banding Armatures.

master mechanic, has supplied the accompanying sketch showing his method of banding armatures without using a lathe. In the sketch as reproduced it will be noted that the armature rests on two special stands. Connecting with these stands and running alongside the armature is a 2 by 4 inch hardwood tension bar on which, by means of lag screws, fiber tension blocks can be placed to guide and place in tension the banding wire taken from a reel standing on the floor below. A special crank is arranged to fit the pinion end of the shaft so that the armature may be turned while placing the band wire.

ARNOLD REPORT ON NEW YORK SUBWAY SIGNALS.

In an exhaustive report upon the subject of the signal and interlocking system in use in the New York subway, Bion J. Arnold, consulting engineer, has recommended to the public service commission that improvements be made in the signal apparatus by which less headway for express trains may be obtained without sacrificing the safety of passengers, and that after these improvements are perfected the local tracks be equipped with the same block signal system as is now used on the express tracks. An abstract of the report follows:

The present plan of express stations is criticized by saying that if they were double-decked or otherwise planned to allow the movement of express trains alternating on one and the other sides of express platforms, the capacity of the subways would be increased fully 50 per cent.

The signal changes he recommends would make possible a headway of 90 seconds, or 40 trains an hour, on both express and local tracks. At present the rate is about 30 trains an hour.

The signal system installed in the tunnel tracks of the subway system and on a part of the elevated structure is what is known as an electro-pneumatic system, the block signals being automatic and the interlocking, semi-automatic, that is, controlled by a lever in an interlocking machine and also by a track circuit. The local tracks between Brooklyn bridge and Ninety-sixth street station are but partly equipped with signals, these being placed principally at critical points where there are short curves. At certain points on the elevated structure where a supply of compressed air is not available, a number of signals have been installed, which are operated by solenoids using current from the third rail.

The existing signal system is as complete as it was possible to make it at the time it was put in (1904), but the art of signaling has made rapid strides since that time. According to the records furnished by the Interborough company for the two years from October 1, 1905, there were 155,064,894 signal and stop operations with 497 failures, or one failure to 312,001 of block and interlocking signal and automatic stop movements. This is considered a satisfactory test of the signal system in use, but it is believed that with new methods and appliances perfected since the installation of the system, it can be greatly improved.

Several observations were made of the movement of trains in the subway. The highest observed speed was 40 miles an hour. The usual speed of express trains at places favorable for fast running was 35 miles an hour. Heavily loaded northbound express trains leaving the Brooklyn bridge made 32 miles an hour.

At the Grand Central station, where the observations were confined to the movement of trains at express platforms, the number of trains moved an hour was 27 northbound and 29 southbound, and the average time interval between the arrivals of trains was 2 minutes and 12 seconds northbound and 2 minutes and 1 second southbound. The average length of stop was 58 seconds northbound and 35 seconds southbound. The shortest stop was 25 seconds on both tracks and the longest stop was 82 seconds on the northbound and 62 seconds on the southbound track.

The average length of time required for the trains to pass from Grand Central station block indicates that under present conditions, it is hardly possible to maintain a 2-minute headway upon the express tracks during rush hours.

There is a special signal placed just outside of each express station which operates to prevent approaching trains from running into a train standing at the station. Since the system was installed, this stop signal has been brought nearer the station platforms for the purpose of reducing the delay in trains stopped by it, and thereby increasing the capacity of the express tracks. Inasmuch as the alertness and attention of the motorman are relied upon to prevent collisions, Mr. Arnold thinks that some automatic device should be added so as to make the safety absolute in the case of signals at express stations. Final changes in the present system should move the automatic stop farther away from the platform, rather than closer to it.

The existing system with its automatic safety trip insures absolute safety on the express tracks between stations, and that it should be important to provide the same degree of safety in the station blocks by means of automatic stops.

As a temporary means of increasing the efficiency of the existing signal system, Mr. Arnold suggests a visual and audible signal to be given by the stopped train to a subway platform station attendant that the entering trains has been delayed to the extent of a full stop. He also suggests a manually operated switch whereby an attendant can release the emergency stop holding the entering train and giving it the signal to proceed after the leaving train has begun to move. Much time is now lost, he says, because the proceed signal is not given to the motorman of the entering train until the last car of the leaving train has left the platform.

Conclusions.

(1) The subway signal system is in the main, modern effective and well maintained.

(2) There is no reason, so far as the signal system is concerned, why a 90-second headway cannot be maintained.

(3) This 90-second headway will eventually be desirable upon both local and express tracks.

(4) The signal system at the present time does not afford positive safety at the approach to stations, as the motormen are relied upon to reduce the speed of the trains.

(5) In addition to the excessive platform waits, additional time is lost at each station stop by holding the following train a considerable distance out of the station until the leaving train has entirely cleared the platform.

(6) As at present operated delays at the station platform have a cumulative effect upon the following trains so that even one prolonged stop may disarrange the schedule for the entire hour.

Changes Recommended.

(1) That the necessary steps be taken to develop and install an automatic speed control signal system to be used as an auxiliary at station blocks which will allow the incoming train to safely approach the rear of the train at the platform and to enter the platform promptly upon the leaving of the outgoing train without sacrificing any of the standard of safety which is now maintained between stations.

(2) That during the development of the system there be installed at every express station the changes in the block signal system proposed by the Interborough company for Grand Central station. The equipment required for these changes will reduce the present possible headway by 7 seconds, and could ultimately become a part of the permanent recommended arrangement.

(3) That the subway officials consider, for the purpose of effecting temporary relief, the installation of a manually operated permissive signal at every express station to be used to expedite a delayed incoming train and thus overcome the cumulative effects on the schedule of a prolonged station wait.

(4) That the local tracks be protected by a complete block signal system when the automatic speed control system, herein suggested has been perfected.

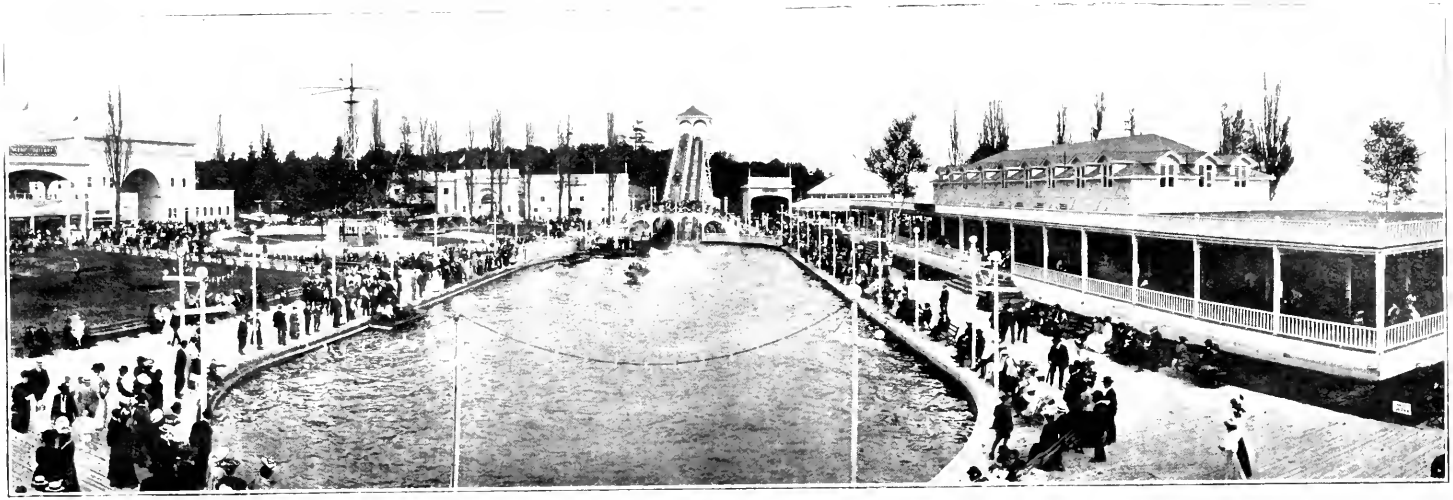
(5) That, when the load on the subway increases to such an extent as to require additional conductors for carrying the electrical energy to and from the trains, the present signal system be altered so as to utilize both rails for carrying the return current, and at the same time make the system conform to the latest accepted practice whereby the signal system detects and indicates a broken or removed rail, provided the system shall at that time have proved superior to the single-rail system.

The Abandonment of 5-Cent Fares.

The Stone & Webster Public Service Journal for March discusses the recent address of P. F. Sullivan, president of the Boston & Northern Street Railway Association, before the Massachusetts Street Railway Association. An abstract of the article follows:

Street railway fares should vary in accordance with the principle that causes general prices to vary as conditions change. Nothing short of a varying transportation charge will place the street railways of Massachusetts in a financial position which, as honestly capitalized and honestly conducted business enterprises, they have a right to occupy. The salient fact with reference to the situation is, that as the street railways have extended into the rural districts they have decreased their income per track mile and increased their interest charge per passenger. The maintenance of the 5-cent unit of fare, in the face of these conditions, is what has produced the present situation. The company in New Bedford has resisted the temptation of the last 10 years to branch out into the country; as a result of this policy, its profits are 8.8 per cent on its capital stock and premiums, its interest charge per passenger being at a minimum point.

The Portland (Ore.) Railway Light & Power Company will open its large amusement park, The Oaks, on May 15. The resort will be operated directly by the railroad company this year, instead of being leased, as was the practice before last year.



Scarboro Beach Park, Toronto—Panoramic Views of Grounds, Showing Lagoon, Amusement Buildings and Lake Front.

SCARBORO BEACH PARK, TORONTO, CANADA.

We present herewith illustrations from Scarboro Beach Park, a summer amusement resort operated at Toronto, Ont., by the Toronto Park Company, Limited, in which the Toronto Railway Company is largely interested, and which adds greatly to the railway company's summer traffic.

The summer park idea had reached its full development in the United States long before it was introduced into Canada. The first Canadian enterprise of sufficient importance to rank with the pretentious parks of American cities was launched in Montreal several years ago. This venture proved such a novelty to the pleasure-loving French people, who form so large a portion of the population of that city that the park won an immediate success and turned the thoughts of its promoters toward other Canadian cities. Scarboro Beach, Toronto, came into existence as a natural sequence. Now the Beach is the premier pleasure resort, not only of the city of Toronto with its 300,000 population but of all Ontario, the largest and wealthiest province in Canada.

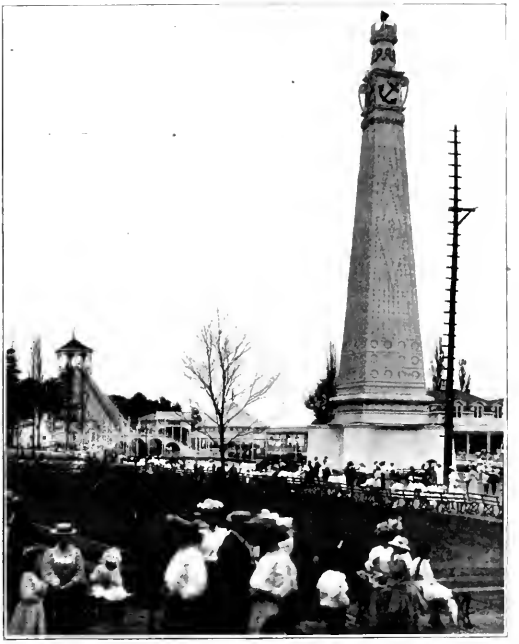
Scarcely more than a year ago H. A. Dorsey, whose enterprises of this character have been on an important scale in several cities, interested himself in the establishment of Scarboro Beach in Toronto. The Toronto Park Company was organized and the company secured a charming stretch of woodland comparatively close to the center of the city and situated on Lake Ontario.

Although the people of Toronto had enjoyed a well-managed amusement center, situated at Hanlan's Point, a short boat trip from the city, a street railway park of the character familiar to residents of American cities was comparatively new to them, and in spite of the fact that the opening season was handicapped by unusually cold and rainy weather, the park speedily took its place as the one of the most important summer institutions of the city., Toronto people are proverbially fond of aquatic sports and the Toronto Park Company speedily found that one of its greatest assets was its stretch of water front and sandy beach, reputed to be one of the finest on Lake Ontario. In the center of this beach the company erected Scarboro Inn, a commodious and modern restaurant with broad sweeping piazzas from which the patrons of the park witness the water sports. One of the most popular of these events is the war canoe race. The canoes, which are modeled after those used by the Indians, each carry a crew of 24 paddles, and the long slender craft are propelled through the water with marvelous speed and dexterity. To see the crews of several war canoes sweeping down to the finishing line after a mile race, is said to be more exciting that a close contest for the Vanderbilt cup.

The park, which is bounded on one entire side by Lake Ontario, has an area of 20 acres, a portion of which is still covered by the last representatives of the primeval forest. This grove is the natural adjunct of the beach, and is a most potent attraction for patrons of the park who come by daylight, being constantly in use for picnic and excursion parties. After 6 o'clock the grove is brightly illuminated. An artificial lake, 50 by 100 feet, with concrete walls, is used in connection with the Chute-the-Chutes, which is 80 feet high with a slide about 600 feet. Boats on the Chute-the-Chutes make the trip in 11 seconds, and the device is said to be one of the most solidly constructed in America. The scenic railway, which parallels the beach at the opposite end of the grounds, has 2,800 feet of track and has a passenger capacity of 28 people every 22 seconds. The railway is of modern and very substantial construction and is equipped with a block system of signals and specially designed improvements for loading and unloading passengers. The park company also operates all of the other devices of the grounds, including "The Old Mill," "San Francisco Earthquake," a roller skating rink, "Third Degree," "Infant Incubator," carousel, laughing gallery, shooting gallery, circle swing, cafe, "Bump the Bumps," etc. The band concerts given by the Scarboro Beach band, under the direction of Conductor Richard Raven, were the means of attracting a great many people to the park during the last season. An instance of the attractive nature of the water aspects of the park is the fact that there are 210 bath houses on the grounds used by swimmers and bathers.

In addition to providing amusement for many thousands, the lake also provides the park with fire protection. The water is pumped through a special 12-inch intake pipe by two centrifugal pumps of 1,000 gallons and 500 gallons capacity per minute, respectively. The pumps are driven by separate electric motors. To supplement this service and to provide for emergency two 6-inch mains from the city water service are also connected with the park.

Scarboro Beach is a complete community within itself. It has its own government, its own army in the shape of a uniformed police force, its own navy represented by a fleet of small boats which patrols the lake in the interest of the bathers, its own hospital, fire department and its population of employes. This community, in spite of the unparalleled bad weather of its first season, attracted more than 500,000 people within its gates between June 1 and September 28, last year, and at the close of the summer it was a formidable rival to the Industrial Exhibition, Toronto's great annual fair.



Scarboro Beach Park, Toronto—Electric Tower and Chutes.

A party of officers and directors of the Philadelphia Rapid Transit Company, city officials and others made an inspection trip through the new Market street subway in Philadelphia on March 12. At a banquet in the evening, James P. McNichol of the Millard Construction Company, which has the contract for the subway, announced that it would be ready for operation by September 1.

The Erie Railroad has abandoned passenger train service between Buffalo and Niagara Falls, N. Y., on account, it is reported, of electric railway competition.

ASSOCIATION COMMITTEES.

To assist in carrying on the work of the American Street and Interurban Railway Association and its affiliated bodies during 1908, the following committees have been announced:

American Association.

Membership.—H. H. Vreeland, chairman, New York; C. S. Sergeant, Boston, Mass.; W. Caryl Ely, Buffalo, N. Y.; F. G. Simmons, Milwaukee, Wis.; E. C. Foster, New Orleans, La.; B. B. Davis, Columbus, O.; C. M. Graves, Spokane, Wash.; F. R. Henry, St. Louis, Mo.; A. W. Warnock, Minneapolis, Minn.; H. J. McGowan, Indianapolis, Ind.; C. L. S. Tingley, Philadelphia, Pa.; W. A. House, Baltimore, Md.; S. W. Mower, London, Ont.; T. K. Glenn, Atlanta, Ga.; A. H. Ford, Birmingham, Ala.; J. H. McGraw, New York, N. Y.; H. M. Wilson, Chicago, Ill.; C. B. Fairchild, Jr., Cleveland, O.; Ernest Gonzenbach, Sheboygan, Wis.; P. P. Crafts, Clinton, Ia.; T. E. Mitten, Chicago, Ill.; A. H. Classen, Oklahoma City, Okla.; J. McMillan, Los Angeles, Cal.

Subjects.—T. E. Mitten, chairman, Chicago, Ill.; J. F. Calderwood, Brooklyn, N. Y.; R. I. Todd, Indianapolis, Ind.; F. R. Henry, St. Louis, Mo.; F. G. Simmons, Milwaukee, Wis.; H. R. Goshorn, Philadelphia, Pa.; C. L. Allen, Utica, N. Y.

Compensation for Carrying Mail.—G. T. Rogers, chairman, Binghamton, N. Y.; Robert McCulloch, St. Louis, Mo.; G. H. Harries, Washington, D. C.; W. B. McKinley, Champaign, Ill.; P. F. Sullivan, Boston, Mass.

Insurance.—H. J. Davies, chairman, Cleveland, O.; C. O. Kruger, Philadelphia, Pa.; G. L. Estabrook, Philadelphia, Pa.; A. H. Ford, Birmingham, Ala.; R. B. Stearns, Highwood, Ill.

Municipal Ownership and Public Relations.—W. Caryl Ely, chairman, Buffalo, N. Y.; J. B. Parsons, Philadelphia, Pa.; C. W. Wetmore, Milwaukee, Wis.; J. C. Hutchins, Detroit, Mich.; H. M. Thygeson, Minneapolis, Minn.; J. A. Beeler, Denver, Colo.; H. M. Sloan, Chicago, Ill.; J. J. Stanley, Cleveland, O.; Russell Robb, Boston, Mass.; Bernard Corrigan, Kansas City, Mo.

Welfare of Employes.—E. G. Connette, chairman, Worcester, Mass.; W. A. House, Baltimore, Md.; J. M. Roach, Chicago, Ill.; J. B. Crawford, Ft. Wayne, Ind.; R. R. Smith, Louisville, Ky.

Federal and State Regulation.—G. H. Harries, chairman, Washington, D. C.; J. I. Beggs, Milwaukee, Wis.; H. J. McGowan, Indianapolis, Ind.; C. L. Allen, Utica, N. Y.; T. E. Byrnes, New Haven, Conn.

To Confer with Interstate Commerce Commission on Depreciation.—G. H. Harries, chairman, Washington, D. C.; J. I. Beggs, Milwaukee, Wis.; F. R. Ford, New York, N. Y.; A. W. Brady, Anderson, Ind.; C. S. Sergeant, Boston, Mass.

To Confer with Interstate Commerce Commission on Classification.—G. H. Harries, chairman, Washington, D. C.; C. L. Allen, Utica, N. Y.; F. R. Ford, New York, N. Y.; A. W. Brady, Anderson, Ind.; W. B. McKinley, Champaign, Ill.

Accountants' Association.

Standard Classification of Construction and Equipment Accounts and Form of Report.—W. F. Ham, chairman, Washington, D. C.; H. L. Wilson, Boston, Mass.; F. R. Henry, St. Louis, Mo.; W. G. McDole, Cleveland, O.; C. N. Duffy, Milwaukee, Wis.

International Standard Form of Report.—H. J. Davies, chairman, Cleveland, O.; W. G. Ross, Montreal, Que.; F. E. Smith, Chicago, Ill.

Collection of Blanks and Forms.—E. M. White, New York, N. Y.

Claim Agents' Association.

Employment.—B. B. Davis, chairman, Columbus, O.; H. V. Drown, Newark, N. J.; T. B. Donnelly, Connellsville, Pa.

Ways and Means.—William Tichenor, chairman, Indianapolis, Ind.; M. S. Rausch, Milwaukee, Wis.; Louis Lipphardt, Wheeling, W. Va.; H. K. Bennett, Fitchburg, Mass.

Transportation and Traffic Association.

Express and Freight Traffic.—H. H. Polk, chairman, Des Moines, Ia.; W. S. Dimmock, Tacoma, Wash.; A. L. Eastman, Utica, N. Y.; Charles Paxton, Dayton, O.; J. L. Lathrop, Spokane, Wash.

Passenger Traffic.—M. C. Brush, chairman, Boston, Mass.; F. W. Coen, Cleveland, O.; E. F. Peck, Schenectady, N. Y.; Franklin Woodman, Haverhill, Mass.

Rules, City Operation.—D. McDonald, chairman, Montreal, Que.; E. J. Ryon, Schenectady, N. Y.; G. O. Nagle, Wheeling, W. Va.; R. S. Goff, Boston, Mass.

Interurban Rules.—J. N. Shannahan, chairman, Baltimore, Md.; L. E. Fischer, Danville, Ill.; J. E. Duffy, New York Association; F. D. Carpenter, Central Electric Association; Charles Currie, Akron, O.

Training of Employes.—J. W. Brown, chairman, Connellsville, Pa.; E. P. Shaw, Jr., South Framingham, Mass.; W. C. Ludwig, Baltimore, Md.; W. R. W. Griffin, Rochester, N. Y.; C. D. Emmons, Ft. Wayne, Ind.; H. W. Fuller, Washington, D. C.

The membership of the standing committees of the Engineering association was announced in last week's issue of the Electric Railway Review.

HEAVY ELECTRIC TRACTION.

Albert H. Armstrong, railway engineering department General Electric Company, addressed the Minnesota section of the American Institute of Electrical Engineers in St. Paul, March 16, on "Heavy Electric Traction." The meeting was very well attended and the presence of a number of steam railway men testified to their interest in the progress of electrification work.

Mr. Armstrong opened his paper by reviewing briefly, with the aid of lantern slides, the modern development of electric haulage, using as illustrations the West Jersey & Seashore, New York Central and New York New Haven & Hartford installations. He also showed the gasoline-electric car as an example of what could be done on branch lines where infrequent service—say at two or three hour intervals—was all that was required. The car shown, with a capacity of 40 passengers, will make a schedule speed of 25 to 30 miles per hour, with stops 5 or 10 miles apart on a consumption of about 0.4 gallon of gasoline per car-mile. This car is not recommended as a competitor of the electric railway but rather to take the place of the light locomotive-hauled train in sparsely settled districts, where the first cost of a trolley line is not justified. [The General Electric gas-electric car was described and illustrated in the Electric Railway Review, January 25, 1908, page 110.]

The speaker dwelt particularly on the application of electricity to tunnel operation at the present time. In this connection he referred to the Cascade tunnel of the Great Northern Railway, where 200-ton three-phase locomotives will haul all traffic through the 2½-mile tunnel. Three-phase locomotives were chosen because of their adaptability to operation on continuous grades and on account of the probability that electricity will supersede steam over the entire Cascade division some time in the future. Another count in favor of the three-phase locomotives is the simplicity of braking by means of regeneration with this type of apparatus.

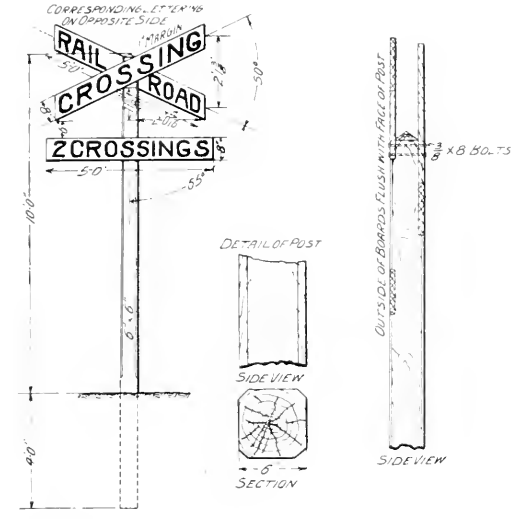
One thousand tons is the maximum train it is now feasible to handle over a 2.2 per cent grade, on account of the draft and brake rigging. Up this grade the present locomotives haul freight trains at a maximum speed of 10 miles per hour and passenger trains 16 or 17 miles per hour, while descending the speed is perhaps twice as great. It is safe to operate at high speeds going up than it is going down grade, and here it is that a strong feature of the electric locomotive is apparent, for with it there is no difficulty in making power enough available to handle trains up grade at the highest speeds allowable with the given curvature and track condition. In other words, the electric locomotive eliminates the ruling grade. With braking accomplished by regeneration there is a great added safeguard available in electric operation, which on a large division furnishes at the same time a material saving in the power station generating equipment required.

In answering a question as to the equipment he would recommend for a long overland route, Mr. Armstrong did not regard it as necessary or desirable to confine himself to any one type. He would possibly use direct current for terminals, single-phase alternating current for long prairie divisions and three-phase current on mountain divisions, taking advantage of the desirable features of each class of equipment.

The operating officials of the Marion Bluffton & Eastern Traction Company, Bluffton, Ind., have formed an officers' club and will hold frequent meetings to discuss matters pertaining to the operation of the road.

SIGN POST FOR HIGHWAY CROSSING TWO RAILWAYS.

The Indiana Union Traction Company will install at all highway crossings where its lines immediately parallel steam railroads a crossing sign of the type herewith illustrated. It will be noted that this sign comprises a main post 6 by 6 inches in section and 14 feet high, set 4 feet in the ground. At the top of the post are the two nsual 5-foot signboards and underneath these, placed horizontally, is a board 5 feet long by 8 inches high, lettered, "Two Crossings." These three

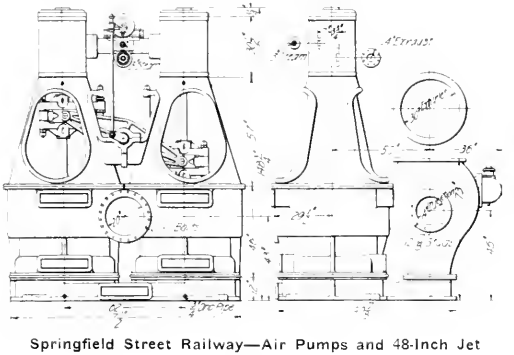


Indiana Union Traction Company—Sign Post for Highway Crossing Two Railways.

signboards are mortised flush with the surface of the upright post and securely fastened with bolts 8 by 3 inches.

POWER STATION IMPROVEMENTS AT SPRINGFIELD.

The Springfield Street Railway Company, Springfield, Mass., has recently increased the capacity of its power plant



Springfield Street Railway—Air Pumps and 48-Inch Jet Condenser.

by the addition of a 3,000-horsepower engine and a large jet condenser.

The new engine, built by McIntosh, Seymour & Co., Auburn, N. Y., drives a 2,000-kilowatt generator. The engine has a high-pressure cylinder 38 inches in diameter and a low-pressure cylinder 78 inches in diameter. The stroke 60 inches and the unit runs at 75 revolutions per minute. The engine weighs 723,000 pounds and the flywheel 130,000 pounds. The bearings of the main shaft are 25 inches in diameter.

The condensing equipment which has been installed in connection with the new engine was built by the Blake Pump & Condenser Company, Fitchburg, Mass. This unit comprises twin vertical air pumps with steam cylinders 18 inches in diameter designed for 200 pounds pressure. The buckets are 44 inches in diameter and have a 24-inch stroke. An accompanying illustration exhibits the general dimensions of the air pump and the 48-inch jet condenser. We are indebted to R. G. Tyler, superintendent of motive power Springfield Street Railway, for the data and illustration presented herewith.

PAY-AS-YOU-ENTER CARS TO BE OPERATED IN NEW YORK.

The receivers of the New York City Railway have announced that 155 pay-as-you-enter cars will be placed in operation on the Fourth and Madison avenue line on March 22. These cars were built by The J. G. Brill Company and were described and illustrated in the Electric Railway Review of October 26, 1907, page 709. They are 48 feet long over all, or 11 feet longer than the present standard car of the New York City Railway, the car body being 32 feet long, 4 feet longer than the present car and slightly wider. The platforms are 7 feet 6 inches long by approximately 6 feet wide, and will accommodate more than 20 persons. The cars are built for double-end operation and as far as the operation of the pay-as-you-enter system is concerned are like those used by the Chicago City Railway and the International Railway of Buffalo. The interior is handsomely finished in maple.

Passengers will be allowed to stand on the front platform but smoking will not be permitted. The conductors will be instructed not to admit more than 75 passengers and after a car is full no more stops will be made except to let off passengers.

The fares will be collected and registered by the conductor. Later, if the public receives the new cars favorably, the Tec automatic register, as described in the Electric Railway Review of January 4, page 32, will be adopted.

An experiment will be made with a colored light signal displayed at night upon the front of the car and indicating by the colors blue, green, yellow or red the destination for which the car is bound.

The company has conducted a campaign of advertising to prepare the public for a favorable reception of the cars. Folders and booklets describing the pay-as-you-enter system have been distributed through the territory served by the Fourth and Madison avenue cars, and statements have been given to the newspapers setting forth the advantages of the pay-as-you-enter plan in the way of reduction of accidents and increased comfort to passengers, with directions as to how the public may co-operate with the company to secure the best results. On Thursday of this week Oren Root, general manager, took a party of press representatives on a trial trip in one of the cars and on Friday morning all of the leading papers published prominent articles, with photographs, describing the cars.

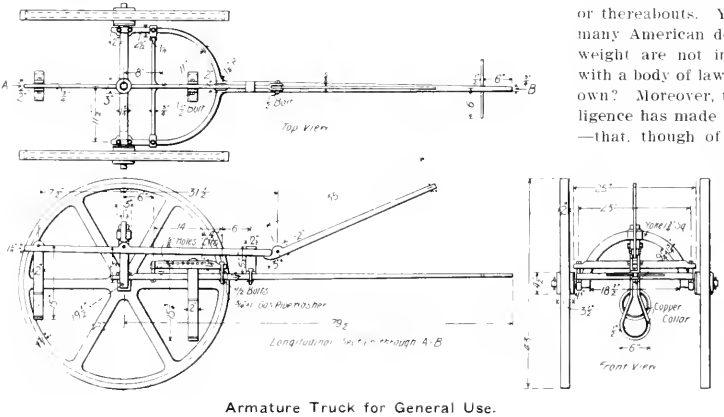
The company states that many persons whose testimony should be regarded as expert have maintained that it is impracticable to operate a car of this character under the conditions prevailing in New York City, but it is the belief of the company that the use of the pay-as-you-enter car should prove a step in advance toward bettering transportation systems.

The Kanauga Traction Company, Kanauga, O., has begun operating gasoline cars on its lines between Gallipolis and Kanauga, O. Two 35-foot cars are now in operation and others will be purchased.

A WELL-DESIGNED ARMATURE CARRIAGE.

There are but few street railway shops that are built so that overhead travelers can carry the armatures from the cars to the winding room and back again. In fact, many shops which have been in use for several years are so designed that the armature is removed from a car in one portion of the building anywhere from 100 to 300 feet—and in some cases yards—from the winding room, thus making it necessary to retrace this distance after the armature has been wound and ready to replace on the car. Again, there are instances when, after the armature is wound or the repairs are made, it is necessary to move the armature to the machine shop, as not all shops are fitted with lathes for turning the armatures in the winding room. The armature must then be transported back to the winding room until such time as it is needed for a car, when it must be moved again. This condition, it will be seen, calls for transporting the armature four times, from the time it is taken from the car until it is returned.

The sketch shown herewith illustrates an interesting method used on a western road for the handling of armatures without the use of an overhead traveler. There is no tugging or lifting; the armature is simply straddled with the truck and the lever raised so that the collars will come under the armature shaft ends. It then becomes an easy matter for one man with the assistance of the leverage to lift from the floor and lock into place an 800-pound armature and walk off with it. This probably is as simple and convenient a method for handling armatures as could be found without the use of an overhead traveler.



Armature Truck for General Use.

Depreciation of Steam Plant.

It is impossible to establish a hard and fast basis for depreciation of a power plant. But Mr. Charles T. Main, mill engineer, Boston, very concisely presents the average condition as follows: "With water and good care, running about 12 hours a day, the life of a boiler should be about 20 years, or the depreciation 5 per cent a year. Slow-speed engines, running 10 hours a day, can be estimated as having a life of about 25 years, or a depreciation of 4 per cent a year. High-speed engines are much shorter lived, and will not average over fifteen years, or a depreciation of about 7 per cent a year; and oftentimes it is greater when run 10 hours a day. The depreciation when run 20 to 24 hours a day is correspondingly greater. Boiler settings and piping should be included with the boilers, and engine foundations and piping with the engines. The life of economizers varies with the initial temperature of the entering water from about ten years up to forty."

BOOK TABLE.

Negligence in Law (Third Edition). By Thomas Beven. 1908. Published by Stevens & Haynes, London; Canada Law Book Company, Toronto; Cromarty Law Book Company, Philadelphia. Cloth, two volumes, 1505 pages, 6½ by 10 inches.

The author states that the preparation of this edition has taken up a very large portion of his time during the last three or four years, and the result is not the mere bringing up to date which at regular intervals is necessary in order to keep a law book in life, but the presentation of a considerable body of new problems and conclusions. He says, too, that he has used considerable freedom in inquiring into the validity of the decisions arrived at. Nor does he recognize the validity of the representation made to him more than once that he should omit everything not fitted for the purposes of practitioners in a hurry.

It is also important to note that the author says that he has made some alteration in his point of view. In the first instance he made an attempt to present the law of the United States side by side with the English. But he is now convinced that such an attempt is impossible of success and also inexpedient. To illustrate this he says that he has in his possession a vast American treatise on negligence. It is in six volumes, has 7,741 pages, and deals with 36,000 cases or thereabouts. Yet even in these generous limits very many American decisions on negligence of the greatest weight are not included. What hope then of dealing with a body of law so enormous in addition to his prolific own? Moreover, the study of this Encyclopedia of Negligence has made plain to him what he before suspected—that, though of the same parentage as the English, American law has in late years been developing along divergent lines, and accepts principles as widely applicable that are to the English people not only novel, but fundamentally unsound.

It was the author's conviction of the utter uselessness, for his purposes at any rate, of drawing out this opposition in detail, necessarily at considerable length, that induced him to abandon any attempts systematically to range and compare the two systems. Some three or four hundred, but not all, American cases have in consequence been dropped out of this edition. The American decisions left out have been replaced by colonial. This will show, perhaps better than anything else, the character of work done on this edition, the more important changes made in it, and for whom it will be useful. The subject is a vitally important one, and for those who wish for any reason to get at the English and colonial law on it this work ought to be very valuable.

The word "electric," it may be added, has but three references under it, in the index, "motor car" and "motor car act" together, 3; "tramcar," 9; and "tramway," 11.

The Visalia Electric Railroad on March 10 began regular operation over its new line from Visalia to Lemon Cove, Cal., a distance of 24 miles. The tracks of the Southern Pacific Railroad are used from Visalia to Exeter, 13 miles. Power is purchased from the Mt. Whitney Power Company and transmitted at 17,500 volts pressure to the main substation at Exeter, where it is changed to 11,000-volt 15-cycle single-phase current for transmission to three transformer substations. In these substations the current is stepped down to 3,300 volts for operation. The rolling stock equipment comprises four passenger motor cars, two trailers and a 50-ton electric locomotive, besides several freight cars. The overhead construction is of the single-pole bracket type.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Not Every Increase of Speed or Sudden Jerk Amounts to Negligence.

Mobile Light & Railroad Company v. Bell, 45 Southern Reporter, 56.—The supreme court of Alabama says that the mere charge that the motorman increased the speed of a car with a sudden jerk does not impute negligence to him. The jerk may not have been due to the negligence of the motorman. It is not every increase of speed or sudden jerk of a car that amounts to negligence.

Moving of House Along Track Not Consistent with Company's Rights.

Ft. Madison Street Railway Company v. Hughes and others, 114 Northwestern Reporter, 10.—The supreme court of Iowa says that the defendants proposed to move a house along the plaintiff's track for a distance of a mile and a quarter, thereby not only stopping the running of its cars for many hours and probably for several days, but requiring the removal of its trolley and other wires as well. This would be inconsistent with the company's right to occupy the street.

Again, the court says that where the use of the street has been lawfully appropriated in so far as essential for the operation thereon of an electric street railway, one of the modern conveniences of travel and transporation, there is no tenable ground for demanding that its operation shall cease or be unduly interfered with, or that the value of its franchise shall be impaired or its property destroyed to enable another to make an unusual and extraordinary use of the street in the moving of houses or other structures over it. This would be inconsistent with the franchise granted to which the street has become subject.

The rights of the defendants to the use of the street were limited by those of the company to operate its cars thereon, and they could not insist upon the elimination of its franchise rights in order to give way to them over the road in moving the house. In other words, the defendants had the right to the use of the street as it was, with the trolley line in operation, and not as it would have been had no franchise been granted by the city, and, as they could not move the house lengthwise on the street as they intended without occupying the company's track, destroying the trolley line, and interrupting for a considerable time the operation of its cars, the jury was rightly instructed that they were not entitled to take the house into that street.

Things Company Must Know and Acts of Conductor for Which It Must Provide with Reference to Objects Along the Line.

Indianapolis Traction & Terminal Company v. Holtsclaw, 82 Northeastern Reporter, 986.—The appellate court of Indiana, division No. 2, says that in this case the company constructed the road, and it knew exactly the distance from a certain telephone pole to its track. It knew what kind of cars would be run over the track. It knew what kind of service its employe operating the car would have to perform. It knew that in operating the summer cars the conductor would be required to pass along the running board to take up the fares, and that while passing along the running board his attention would necessarily be drawn to the passengers on the inside of the car; it knew, and was bound to know, that the conductor would be required to move his body in various positions, that he would be required to reach into the car to get fares and to withdraw his body to an upright position, that he would be required to lean back to reach up over his head to take hold of the appliance by which the fares were registered; it was bound to know, too, that at times, when the cars would be crowded and passengers would be standing upon the running board, that the conductor, in passing back and forth along the running board, would be compelled to go around the body of each passenger; and it was its duty to construct its road with reference to objects along the line, where it was reasonably practical to be done, to leave ample room for the movement of its employes and of the passengers who might be expected to ride upon the running board. If the circumstances were different, if the object with which the conductor had collided was some character of structure that could not have been avoided, and to which it was necessary the road should run in close proximity, it would be different; but here the object was a telephone pole which, from its nature, could easily have been moved a distance of one or two feet. The court holds that the question as to whether or not the danger of collision with this telephone pole was a danger that was so open and apparent that the conductor was bound to know of it and therefore to assume the risk, was properly submitted to the jury. For the same reason that the danger was not an assumed risk, the question of whether or not the conductor was guilty of contributory negligence in failing to observe the pole, and the danger that was to be apprehended from it, was a question for the jury.

Rights of Pedestrian Crossing in Front of Standing Car at Curve.

Mittleman v. New York City Railway Company, 107 New York Supplement, 108.—The supreme court of New York, appellate term, says that at the time of the accident in this case the defendant was running cars through Delancey street from west to east and across the Williamsburg bridge. The car tracks, before reaching the bridge, curved sharply toward the south, and then easterly, so that a car running along Delancey street turned and proceeded southerly for a space, turning easterly again before crossing the bridge. On the westerly side of this curve, about two or three feet from the car tracks, was an unguarded excavation about three feet deep. The plaintiff was crossing from Delancey street, going in a southerly direction to Broome street. In so doing she was compelled to pass along a path between the excavation and the car tracks as they curved toward the south. As she, with several others, was about to cross the tracks, a car approaching the curve was stopped by a policeman to enable them to pass. The plaintiff was the last to cross, and she had passed the front end of the car, when it started and she was struck by the rear fender. At that time she was about two feet from the track. The side of the car passed her safely, but the fender, which was fastened to the car by a strap, and one corner of which projected beyond the car about a foot, struck her and threw her into the excavation.

Under these circumstances it could not be said either that the plaintiff was negligent or that she failed to show negligence on the part of the defendant. The motorman knew that the plaintiff and those who had crossed ahead of his car were proceeding near to the track and between the track and the excavation, and it was his duty to wait before starting his car until they had had an opportunity of reaching a place of safety, especially when, as it appeared, even the overhang of the car, as well as the projecting fender, was liable to strike a pedestrian as the car rounded the curve. This duty he evidently failed to recognize.

Although it has been held that a person at or near a curve in a railroad track may be charged with knowledge that the rear end of a car will project a certain distance beyond the track, the decisions declaring this principle had no application to the facts disclosed in the case at bar. The plaintiff crossed in front of a car while it was at a standstill, and she had a right to assume that the car would not be started or so operated as to strike her until she had enjoyed a reasonable opportunity to pass the point of danger.

The court is of the opinion that the plaintiff proved a cause of action, reverses a judgment rendered for the defendant and orders a new trial.

News of the Week

Central Electric Traffic and Railway Associations.

The committee of the Central Electric Traffic Association, appointed at the meeting at Dayton, O., on January 23 to aid in the selection of a chairman for that association and a secretary and treasurer for the Central Electric Railway Association, will meet at the Claypool hotel, Indianapolis, on March 25. The committee will prepare a report to be submitted at the meeting of the Central Electric Railway Association at the same hotel on March 26. The programme for this meeting was announced in last week's issue of the Electric Railway Review.

Progress of the Cleveland Negotiations.

At a meeting of representatives of the Cleveland Electric Railway and of the city of Cleveland on March 11, a tentative plan for a reorganization of the street railway companies was agreed upon. According to this plan, the name of the Cleveland Electric Railway is to be retained. The stock of the Cleveland Electric Railway is to be decreased to an amount equal to the agreed value of the property, and will then be increased by an amount sufficient to acquire the Forest City Railway. Treasury stock will be issued to provide for immediate development of the properties and a lease to the Municipal Traction Company will be executed and given to a trust company to be held in escrow. Further details have been considered in secret meetings. It is stated that the directors of the Forest City Railway object to a consolidation with the Cleveland Electric Railway, and a consequent elimination of the company as an independent concern. Plans have been discussed for holding a special meeting on March 21 to consider the matter before the stockholders meeting on March 28.

Annual Meeting Maintenance of Way Association.

The ninth annual convention of the American Railway Engineering and Maintenance of Way Association was held at the Auditorium hotel, Chicago, on March 17, 18 and 19. Some of the subjects considered were: Uniform rules; signaling and interlocking; water service; strength and endurance of steel rails; iron and steel structures; buildings; ballasting; open versus ballast deck structures; wooden bridges and trestles; rails; track; yards and terminals; roadway; masonry; records, reports and accounts. The results of the election of officers for the ensuing year were announced as follows:

President—Walter C. Berg, chief engineer Lehigh Valley, New York, N. Y.

First Vice-President—W. McNab, principal assistant engineer Grand Trunk, Montreal, Can.

Second Vice-President—L. C. Fritch, assistant to president Illinois Central, Chicago, Ill.

Treasurer—W. S. Dawley, chief engineer Missouri & North Arkansas, St. Louis, Mo.

Secretary—E. H. Fritch, 762 Monadnock, Chicago, Ill.

Directors—Charles S. Churchill, chief engineer Norfolk & Western Railway, Roanoke, Va.; E. W. Wendt, assistant engineer Pittsburg & Lake Erie, Pittsburg, Pa.; D. D. Carothers, chief engineer Baltimore & Ohio, Baltimore, Md. (to fill vacancy).

New Wage Scale on the Inter-Urban Railway.

H. H. Polk, president and general manager of the Inter-Urban Railway, Des Moines, Ia., advises us that the new wage scale recently put in effect is as follows: For conductors and motormen, 19 cents per hour for the first year's service with an increase of 1 cent per hour for each succeeding year including the sixth; for passenger brakemen, 15 cents per hour for the first year, 16 for the second and 17 for the third year and thereafter; for freight brakemen, 17 cents per hour for the first year, 18 for the second and 19 for the third and thereafter. Other provisions are as follows: "All regular run men shall be paid full time for all necessary deadheading. All regular run men called to take out special cars or special trains shall be paid for the number of hours actually in their regular runs, with overtime allowed for all time in excess of such regular run. When the company finds it necessary to issue a special timecard governing the movements of trains on holidays and special occasions, all regular run men operating under such special timecard shall be paid overtime for all hours in excess of their regular runs. Men in the train service may, with the consent of the company, change from one branch of the train service to another, each man changing to a different branch of the service to comply with all rules prescribed for applicants for work in such branch. In determining the rate of pay of men changing from one branch of the service to another, they shall be allowed full credit for their entire time in the train service of the company. Their seniority standing shall be fixed by the actual duration of their continuous employment in the particular branch of the train service in which they are engaged when the question of seniority arises."

The men asked for an increase of from 44 per cent upward but on March 7 entered into a contract on the basis of this scale dating from February 12, 1908, to March 4, 1910.

Order Preventing Sale of Newspapers on Cars Causes Conflict.

The attempt of certain Chicago newspapers to prevent the Chicago City Railway from enforcing an order prohibiting the selling of newspapers on its new pay-as-you-enter cars reached the proportions of a riot on Tuesday and Wednesday of this week, during the evening rush hour.

Led by the circulation managers of the evening papers and assisted by a large number of adult rowdies, the newsboys made an organized assault on the company's cars on Wabash avenue in the business district and attempted to board the cars to sell their papers in spite of the conductors. Previous attempts of a similar character had been made and the company had made preparations by stationing a guard on each car. The result was a series of conflicts between the boys and their assistants, the company's employes and the police, in which many were injured. The boys and their backers threw stones and other missiles, pulled the trolleys from the wires and before the rioting was stopped by the police, had succeeded in blockading the cars in the loop district for several blocks. Many of them resorted to the plan of offering to pay fare, although the company's position is that they shall not be allowed to sell papers on the cars in any case. Five of the boys were arrested and were arraigned in the municipal court on Thursday, but the cases were continued.

A statement has been issued from President Mitten's office explaining that the order to keep the boys off the pay-as-you-enter cars was made partly for the purpose of preventing accidents and partly because to permit newsboys to rush through the cars would defeat one of the main purposes of the pay-as-you-enter system by interfering with the comfort of the passengers. It is also stated that "although this fight was being advertised as a newsboys' war, it is in fact a war of certain newspapers to compel the company to rescind its rule excluding newsboys. Threats were openly made by adults claiming to represent certain newspapers that if the order were not revoked the company would be compelled to back down. The newsboys did not come into the situation until threats were made by apparently responsible agents of these newspapers."

Educating the Public by Bulletins.

Taxation is discussed in Bulletin No. 5 in the series which President William A. House of the United Railways & Electric Company of Baltimore is publishing in the daily newspapers of that city. This bulletin states that the company pays an average of about 10 per cent of its gross and 20 per cent of its net earnings for taxes, as compared with 6.3 gross and 13.9 per cent net average for cities of 500,000 population or over in the country. The taxes borne by the company are stated as follows:

"(1) It pays a park tax on 9 per cent of all of its receipts in the city before anything is paid toward operating expenses or to creditors; (2) it also pays at the same rate as the citizen, taxes upon its power houses, car houses and other valuable real estate; (3) it also pays taxes on its tracks, which are assessed as real estate; (4) it also pays a tax upon its outstanding shares; (5) it pays heavily for the repair of streets between and beside its tracks, notwithstanding the fact that this requirement is simply a survivor of horsecar days, when the company's horses hammered the streets. Today, with electricity, no injury is done to the streets by the cars, and yet the company continues to pay for the repairs made necessary by carts and wagons, which wear out its tracks and the adjacent street surface; (6) the company pays a license tax for every car put in service; (7) it pays for clearing the ice and snow from its tracks, a larger burden than many people imagine, and not imposed by the city upon any other corporation. In addition to this, the company is heavily burdened by city ordinance requiring it to keep in repair the city bridges to the extent of the space between its tracks and for two feet on either side."

The bulletin then argues that the street car is the poor man's carriage, and if it is taxed too heavily, its efficiency is impaired.

Bulletin No. 4, published in two parts, discussed the "Street Railway as a Developing Agent." After showing how

the healthy growth of a city is influenced by the character of the transportation facilities the bulletin states:

"Prior to 1888 the city area (including the harbor) was 13.2 square miles. In 1888 the city annexed 16.9 square miles, mainly farming lands. Due to the rapid extension of the street railway lines, much of this has since become improved city property, making a tremendous increase in the taxable basis of the city.

"The suburban and country lines accomplish two things. First, a great number of people who have their offices in the city are enabled to live in the country. Second, the sections of the country traversed by the electric lines are brought into much closer relationship to each other, thus greatly enlarging and developing the field of business activity in these sections. The most forcible argument in favor of the value of rapid transit as a developing agent in the country districts is the increase in population and prosperity in these districts which has taken place since the electric lines were built."

Transit Affairs in New York.

Since the city's financial authorities have stated that the city is already indebted to such an extent that it will be impossible to issue additional bonds for subway construction for the next two years, those most interested in the plans for new subways have been studying to find a method by which they may be financed. On March 13, the board of estimate received from Corporation Counsel Pendleton and Ex-Judge John F. Dillon an opinion that the city may let contracts for subway construction in sections so that the entire cost of a subway need not be charged against the constitutional debt limit. The opinion states that providing the rapid transit laws authorize, or may be amended so as to authorize the making of contracts for sections of the work, only the amount of the contracts let need be charged against the debt limit if they are so drawn that the city may terminate the work at the expiration of a contract without further liability.

Mayor McClellan and Comptroller Metz are said to be considering the advisability of recommending that the form of contract for the Fourth Avenue, Brooklyn, subway shall be amended so as to provide for bids for both construction and operation. The contract as it stands calls for bids for building only. It is the opinion of the mayor and comptroller that by advertising bids it might be possible to attract private capital for the building of the new subway.

On March 15 the board of estimate approved the plans for the Broadway-Lexington subway route as laid out by the public service commission. It will now be necessary to apply to the appellate division of the supreme court for the appointment of a commission to decide whether or not the proposed route is a public necessity, so as to avoid the necessity of securing consents of abutting property owners, many of whom are opposed to the plans. Chairman Willcox of the commission says that the commission is ready to let contracts for subways in sections or for the entire work, provided the city authorities will provide for the money. The Fourth avenue subway is divided into six sections, and the form of contract for each section is now ready to be let and awaits only the approval of the board of estimate and apportionment.

Corporation Counsel Pendleton has rendered an opinion that neither the board of estimate nor the public service commission has the power under existing laws to purchase railroads or tunnels already constructed or in process of construction, which, of course, includes the Belmont or Steinway tunnel, which the Interborough Rapid Transit Company has proposed to sell to the city. Mr. Pendleton states, however, that bills have been prepared to be submitted to the legislature which if adopted will authorize the public service commission and the board of estimate, acting together, to purchase existing railroads, including tunnel roads, constructed or in process of construction, suitable for rapid transit purposes.

The commission continued on March 12 the public inquiry into the methods of operation on the Brooklyn bridge. W. S. Menden, chief engineer of the Brooklyn Rapid Transit Company, stated that the new plan of running through elevated trains across the bridge, instead of shuttle cars, made a great improvement in the service, making it possible to run more cars. On the morning of March 10, between 8 and 9 o'clock, he said, 67 cars were operated across the bridge, whereas the greatest number of shuttle cars ever secured in an hour was 62. Mr. Menden added that the service on the bridge will be improved when several changes now contemplated have been put into effect. These include the installation of block signals on the bridge, the widening of the platforms of the Park Row terminal, the enlarging of the track capacity of the Brooklyn yard, the equipment of the platforms at the Manhattan terminal with railings so as to provide for better and speedier means of loading trains and the completion of the elevated structure for trolley cars over Sands street.

On the following day E. E. Winter, president of the Brooklyn Rapid Transit Company, testified in regard to the tolls paid to the city for running cars across the bridge. He said that in 1907 the company paid the city $57,083.90 for surface cars, $91,250 for through elevated cars and $20,306.28 for bridge car rentals and that although the amount of the tolls were deducted from the franchise tax paid to the city there had been a deficit of $2,500,000 from the bridge service since 1900. He said that the company had paid $63,000 toward the cost of reconstructing the Brooklyn terminal and $15,000 for the reconstruction of the tracks at the Manhattan terminal.

On March 14, the public service commission adopted an order directing the Union Railroad, of the Bronx, to thoroughly overhaul its cars and to place them in a condition "substantially as good as new."

Calumet & South Chicago Franchise Ordinance Completed.

The ordinance providing for the consolidation of the Calumet Electric Street Railway and the South Chicago City Railway under the name of the Calumet & South Chicago Railway, and an extension of the present franchises from 1912 and 1915 to 1928, was reported to the Chicago City Council in complete form on March 16 by the local transportation committee. The ordinance was ordered published and is expected to come up for consideration at the next council meeting on March 23. The ordinance requires the construction of seven important extensions before January 1, 1910, a complete rehabilitation of the properties within 3½ years, 10 miles of track to be rebuilt at once, and the company is to purchase 15 new cars within a year.

The city is to receive 55 per cent of the net receipts after operating expenses, taxes and depreciation have been deducted and may purchase the property at the end of the grant for the present value of the property plus the amount expended for rehabilitation and a 12 per cent bonus. The Chicago City Railway may also purchase the property on the same terms but any other company must pay 20 per cent bonus. The valuation of the property is fixed at $5,000,000. Bion J. Arnold and George Weston, the engineers appointed to make a valuation of the property, reported a total of $6,174,545, as follows:

Calumet Electric Street Railway Company	
Physical property	$2,486,868.86
Intangible property	546,095.43
Total	$3,032,964.29
Paving, filling and subways	1,015,642.47
Grand total	$4,048,606.76
South Chicago City Railway Company.	
Physical property	$1,503,588.94
Intangible property	183,872.58
Total	$1,687,461.52
Paving, filling	438,476.74
Grand total	$2,125,938.26

The ordinance provides for universal transfers in the territory south of Sixty-third street, in which the companies operate. This territory is also divided into four transfer zones. In the first zone transfers must be exchanged with the Chicago City Railway at once and the privilege shall be extended to other zones as the earnings increase, to the second zone when the earnings amount to 6¼ per cent on the investment.

Legislation Affecting Electric Railways.

District of Columbia.—A draft of a proposed bill providing for a public utilities commission for the District of Columbia has been distributed to members of the house district committee by Representative Smith. The bill provides for the appointment of a commission of three members, appointed by the president at a salary of $7,500 a year, one of whom shall have been a resident of the district for five years, another must have had experience as a public service accountant and the third must be qualified to value the properties of public service corporations. The commission is to have power to investigate and regulate public service corporations, with jurisdiction over rates, service and intercorporate relations, and may prescribe maximum rates and limit capital issues. Other provisions of the bill are generally similar to those of the New York public service law.

New York.—Senator Travis and Assemblyman Robinson have introduced in the legislature a bill amending the laws with regard to contracts for rapid transit railways. The public service commission is empowered to let contracts for construction and operation as at present, for a term not exceeding

35 years, but with a provision that the city may, at the end of a specified period not to exceed 25 years, terminate the contract for operation and purchase the property at a valuation not to exceed the original cost. It is also provided that the commission may grant indeterminate franchises for construction and operation by private corporations, with a provision that the city may purchase the property at any time after the expiration of a specified period, not to exceed 25 years. The same provision is to apply to extensions of existing lines.—Senator Hartje has introduced a bill authorizing the city of New York to acquire the Steinway tunnel at cost. It is provided that in determining the cost, no consideration shall be taken of the franchises or real estate, and that the cost of labor shall be estimated on the basis of the prevailing rate of wages and the cost of materials at the open market value. All real estate needed is to be acquired separately by condemnation proceedings and the amount realized from the sale of rock and dirt excavated is to be deducted from the cost of the tunnel.

Ohio.—Senator Patterson has introduced a bill giving interurban roads the right of eminent domain in crossing streets, alleys and highways, except where this right would conflict with present franchise laws.

Tests on Plain and Reinforced Concrete.—Bulletin No. 197 of the University of Wisconsin comprises 68 pages reporting a series of tests on plain and reinforced concrete, by Morton O. Withey, instructor in mechanics. The report is illustrated by 30 figures and eight plates, and there are also included 14 tables of data and results. For engineers interested in the performance of reinforced concrete under various loadings this bulletin will be found of especial value.

Western Society of Engineers.—The extra meeting of the Western Society of Engineers announced for Wednesday evening, March 18, has been postponed to March 25, on account of the meeting of the American Railway Engineering and Maintenance of Way Association. J. N. Darling, principal assistant engineer of the South Side Elevated Railroad, will present a paper on "Some Features of Construction of the South Side Elevated Railroad," with lantern slide illustrations. The meeting will be held in the society rooms in the Monadnock block, Chicago.

Accidents in New York.—The New York public service commission of the first district has issued a statement of the accidents on railroad lines within its jurisdiction for the month of February. The total number of accidents for February was 3,951, as compared with 3,921 and 3,993 for January and December, respectively. The number of persons injured in February was 2,157, as compared with 2,500 and 1,937 in January and December, respectively. The serious injuries, however, were only 139, as compared with 188 in January and 200 in December. The number of deaths from such injuries were only 26 in February, whereas there were 44 deaths in January and 51 in December.

Peoria Electrolysis Case.—Some 10 years ago the Peoria Water Company brought action against the Central Railway Company of Peoria, Ill., claiming that the double trolley was the only method of preventing the destruction of the water company's pipes by stray currents from the railway. The water company prayed the court for an injunction restraining the railway company from the use of the single-trolley rail return. The case again came up for hearing at Chicago on Tuesday morning, March 10, before Special Master Frank L. Wean, appointed by Judge Sanburn of the United States circuit court. The original hearing of the case took place about 10 years ago before the same special master. At that time a large number of cities throughout the country were visited by those engaged in the case and testimony taken in such cities. After the hearing was closed, the special master made his report to the court in which he upheld the water company and recommended that an injunction against the operation of the single trolley be granted. The court took no action on the recommendation and in October, 1907, the case was reopened by the complainant's application to the court to hear arguments on the special master's recommendation. In answer the defendant prayed the court for a reopening of the case for the purpose of taking further testimony on account of the advance in the art since the close of the previous testimony. A special order of court was issued permitting that to be done. The railway company presented its testimony last week. The water company then requested an adjournment of the case until April 7 at which time it will present its testimony in rebuttal after which the case will be considered by the special master and his report and recommendations presented to the court and arguments heard thereon. Judge L. C. Pinkney of Peoria is counsel for the railway company and Edward E. Winters of New York is the technical expert.

Traffic and Transportation

Petition for Reduced Fares in Chicopee Denied by Massachusetts Railroad Commission.

The Massachusetts railroad commission has dismissed the petition of the mayor and aldermen of Chicopee for a reduction in the fares on the Holyoke Street Railway and the Springfield Street Railway during the rush hours. The decision of the board follows:

"The petitioners, to whom a hearing has been given, ask for a special rate of fare on these street railways for workingmen and workingwomen on week days, between the hours of 5 and 7 in the morning and 5 and 7 in the evening. It appears that the fare from all points in Chicopee served by the Holyoke Street Railway to Holyoke is 5 cents, and from all points in Chicopee served by the Springfield Street Railway to Springfield is 5 cents.

"The request of the petitioners, if granted, would result in a service for less than 5 cents between Chicopee and Holyoke and Chicopee and Springfield during the so-called 'rush' hours of the day, when a very substantial amount of travel exists, thus materially reducing the revenues of the companies.

"The board is unable to recommend to either company any decrease in existing fares and, therefore, dismisses the petition."

Answers Concerning Coney Island Fare Complaints.

Subsidiary roads of the Brooklyn Rapid Transit Company have filed with the New York public service commission, first district, an answer regarding the complaint that a 10-cent fare to Coney Island is excessive. The answer was signed by officers of the Brooklyn Union Elevated Railroad, the Brooklyn Heights Railroad, the Nassau Electric Railroad, the Brooklyn Queens County and Suburban Railroad and the Coney Island & Gravesend Railway.

The answer denies that the companies are charging more than the legal fares on any of the lines and asserts that any reduction in fare would work a loss in operation. The answer states: "Any reduction of fares charged would effect such a reduction in the receipts as to render all the profits less than 10 per cent per annum upon the capital actually expended. The commission has no jurisdiction or authority to make any reduction in such rates of fare. Any order of the commission requiring a less fare to be charged by said companies, respectively, would impair the obligation of the contracts constituted by the charters and franchises, and of their predecessors in interest respectively and the contracts between them, by the provisions of which each company is legally authorized to charge the rate of fare charged by it. Any order of this commission requiring a less fare would be unconstitutional and void, and in violation of the provisions of the constitution of the United States prohibiting any state from impairing the obligations of contracts. A reduction in fare, if enforced by the commission, would work a confiscation of the property, without due process of law, and would be unconstitutional and void. In so far as the commission law purports to authorize said commission to make any such orders, the law is unconstitutional and void."

Attention is called to the temporary character of the heavy service to Coney Island, which exists principally in the summer season, and only for a few months of each year. It is declared that the average distance traveled by each passenger who pays a total fare of 10 cents exceeds 10 miles.

The Coney Island & Brooklyn Railroad has filed its answer to the complaint concerning a 10-cent fare to Coney Island. This company charges a 10-cent fare to Coney Island on Saturdays, Sundays and holidays only, the rate being 5 cents on other days. An abstract of the answer of this company follows: "While the average amount collected annually in second fares to Coney Island from 1903 to 1907, inclusive, was $97,500, these collections amounted to only $88,541 last year. If the receipts should be depleted by abolition of the second fare the net earnings would not equal the interest on the funded debt, irrespective of depreciation, reserve, contingencies or dividends. A lower fare than 10 cents would not be sufficient to cover the cost of transporation, reserve for depreciation, contingencies and an adequate return upon the capitalization or upon the value of the properties and franchises, which exceed $9,000,000. The actual cost of carrying passengers to and from Coney Island, plus a reasonable return upon the capital, exceeds the revenue received for such transportation at the rate of fare now charged. The company does 75 per cent of its Coney Island business from June to September of each year, and the maximum equipment maintained for this service earns no income for the remainder of the

year. It is more expensive to operate cars in summer than in winter because of the cost of extra men. For that reason is is reasonable to charge a greater rate of fare than for ordinary travel. The lines barely earn their operating expenses from November to May.

"For the year 1907, the company operated 6,651,168 car-miles and its gross earnings were $1,566,146.92, or 23.5 cents a car-mile. Operating expenses and taxes were $1,298,495.86, or 19.5 cents a car-mile. Fixed charges were 6.1 cents a car-mile, making the expense of operating its service, including fixed charges, 25.6 cents a car-mile. The distance of the round trip from New York to Coney Island by way of the Smith street line, is 22.556 miles. To meet operating expenses, taxes, depreciation, reserve, and interest, without any return upon capital stock or reserve for contingencies, the company would have to earn $5.87 a round trip to Coney Island. This would require at a 5-cent fare, 58 passengers each way on every car, day and night, for 365 days in the year. This condition has never existed, and it is manifestly impossible of existence. In the fiscal year ended June 30, 1907, the company carried 39,158,626 passengers, and collected $1,612,924, some of the fares were half or 3-cent fares, the average revenue for each passenger was 4.118 cents above operating expenses and taxes, the net earnings per passenger were 0.831 cent and the net income after the payment of all charges was 0.184 cent."

The company asks that the complaint be dismissed, and that the public service commission adjudge a 10-cent fare as not excessive.

Evidence in Atlanta, Ga., Fare Case.

The Georgia railroad commission now has under consideration the evidence on the application for reduction in the fares charged by the Atlanta Northern Railway, which is controlled by the Georgia Railway & Electric Company of Atlanta.

At the hearing before the commission, P. S. Arkwright, president of the Atlanta Northern Railway, introduced evidence showing the cost of the road and its earnings and expenses; the charges of other interurban roads; and evidence distinguishing an interurban road from the ordinary street railroad, and the ordinary steam railroad. In addition to this, the company had a petition signed by a large number of representative people on the line of the road. This petition was drawn up voluntarily by them and was an expression on their part to the commission that they considered the service excellent and the fares reasonable and did not think the fares should be reduced.

In its answer the Atlanta Northern Railway said that "it has complete and accurate accounts of the actual expenditures made in the construction of its railroad; the total cost, to December 31, 1907, of constructing and equipping the railroad was $598,087.62; the cost of supplies on hand was $3,408.65; cash on hand amounted to $2,596.72; accounts receivable, $346.30; prepaid accounts, $591.96, making the total assets $605,031.25.

"The item of 'Organization' consists only of expenses connected with the engraving of bonds and the preparation of the mortgage to secure the bonds. The item 'Engineering and Superintendence' is only a small part of the engineering and superintendence properly chargeable to the construction, the balance of such charge being distributed in the other items, and a large portion of the engineering and superintendence having been furnished by the Georgia Railway & Electric Company without charge. The item 'Right of way,' includes only the actual payments to the owners of the land for the privilege of constructing the road."

"The gross receipts for the year ending December 31, 1907, were $138,445.65; operating expenses, as charged on the books, were $99,303.72. In the operating expenses no allowance has been made for depreciation and final renewals, or contingencies. A fair annual allowance, in addition to maintenance, required to take care of such depreciation, would be at least $20,733.98, being 5 per cent of the cost of those items of the property which deteriorate. The amount of taxes paid for 1907 was $3,279.42. The net earnings for the year, above operating expenses, taxes and allowance for depreciation, will be $15,206.38, which is a return of 2½ per cent on the total cost of the property, $605,031.25.

"The year 1907 was a prosperous year in all lines of business but toward the latter part of the year there was a general falling off in all business. Respondent's earnings reflect this general condition and there has been a decrease in its gross earnings and an increase in the operating expenses. For January, 1908, the gross receipts, as compared with January, 1907, decreased $2,528.81, or 25.66 per cent; operating expenses increased $857.22, or 12.35 per cent, and were 106.4 per cent of the gross receipts, whereas operating expenses for January, 1907 were 70.4 per cent of the gross receipts. In February, 1908, the gross receipts decreased $2,223.72, as compared with February, 1907. For December, 1907, gross receipts were $863.94 less than for December, 1906, showing a decrease of 7.58 per cent; operating expenses for December were 95.18 per cent of the gross receipts, whereas for the month of December, 1906, the operating expenses were only 60.39 per cent of the gross receipts. Instead of decreasing revenues, it is absolutely essential to increase the revenues or to decrease the service furnished and thereby lessen expenses, in order that respondent may be able to earn sufficient to pay its operating expenses and taxes, without any regard for the cost of the property or any return whatever on such cost or on any valuation whatever.

"No dividend whatever has been paid. The entire earnings have been required for the operation and maintenance of the property, and in paying interest and no sum has been left over, and in fact not enough accumulated to meet the expenses with which respondent is now faced. About a year ago application was made to the railroad commission for a reduction of the passenger fares, and as a result of such investigation the commission decided that the fares charged were reasonable and should not be reduced.

"The rate of fare now charged is not unreasonable. It is reasonable to the public because the service rendered is well worth the charge made, and from the standpoint of the company it does not yield any profit to its projectors and stockholders, or any return for money invested, risk undertaken, or the energy, efforts, skill and ability required in its construction and operation. The rates are no higher than those charged by similar railroads in other sections of the United States and, its fares are lower than those charged by other railroads in Georgia. Respondent is in no condition to stand a reduction of its present fares; such reduction would destroy its ability to provide such service as its patrons are entitled to and would render it unable to earn operating expenses and interest on its debts. This road is the first railroad of its class to be built in Georgia; the building of such roads is of great advantage to the people. It would be against public policy and the interest of the people to discourage the building of such roads by forcing the amount of their charges so low as to deprive them of a reasonable return on the investment necessary to be made. The charges made by respondent are as low as it is possible for them to be made for such a road and leave any hope for any return."

Orders Affecting Service in New York.—The New York public service commission, first district, has ordered the Interborough Rapid Transit Company to run three additional 7-car trains on the Third Avenue elevated road in the rush hours. The company is also ordered to "satisfy or answer" a complaint that there are too few ticket booths at the Brooklyn bridge station of the subway.

Contract with Express Company Not Renewed.—The receivers of the New York City Railway have ordered that the contract with the American Express Company, which expired on March 15, shall not be renewed. The receivers maintain that the large number of package cars required impaired the efficiency of the passenger service. The American Express Company will probably inaugurate an automobile truck service to meet the new conditions.

Rates to Brazil, Ind.—The Terre Haute Indianapolis & Eastern Traction Company of Indianapolis has filed an answer to the petition of residents of Brazil, Ind., to the Indiana railroad commission, requesting the commission to compel the company to readjust rates on the line between Brazil and Terre Haute. In its answer the company declared that it had petitions from the majority of their patrons along the territory asking that the new rates be maintained, and expressing themselves as being perfectly satisfied with the new rates.

Transfer Station Decision in Boston.—The Massachusetts railroad commission has disapproved the application of the Boston Elevated Railway for permission to abandon the free transfer station at Coolidge Corner. The commission holds that the maintenance of the transfer system tends to improve the facility of travel and the accommodation of the public.

More Through Routes in Chicago.—The board of supervising engineers, Chicago traction, has ordered the introduction of more through routes, following the introduction of route No. 22 on March 17. The latter route was described in last week's issue of the Electric Railway Review. Routes Nos. 1, 11, 12 and 14, for which provision is made in the ordinances of the Chicago City Railway and the Chicago Railways Company, will be combined as Route No. 23. This route will extend from Ogden and Fortieth avenues on the west side to the car house on North Clark street, and is to be introduced not later than April 7. Route No. 9 will be established on March 30.

Construction News

FRANCHISES.

Columbia, Mo.—The Missouri Land Improvement & Development Company has applied to the city council for a franchise for a street railway.

Gary, Ind.—The Gary & Interurban Railroad has applied for an extension of time in which to complete its line under the provisions of its franchise.

Greeley, Colo.—The Denver & Greeley Railroad, Denver, Colo., has been granted a franchise to enter Greeley with its proposed electric line between Denver and Greeley, Colo., contingent upon having the line completed within three years. Right of way is said to have been secured. J. D. Houseman, Denver, general manager. (Noted November 2, 1907.)—The Greeley & Northern Railway & Utility Company secured a franchise some time ago for the operation of its line in Greeley, which the city council contends has expired. The company has done considerable grading between Greeley and Evans, Colo., and has purchased a right of way paralleling the route of the Union Pacific. It is reported that the two companies may be merged.

Greensboro, N. C.—Charles L. Van Noppen and associates have been granted a franchise in Greensboro for the construction of a 3-mile electric railway in West Market and Lateral streets. It is stated that construction work will be started as soon as the weather permits.

Haverstraw, N. Y.—The West Shore Traction Company has been granted a franchise for a line through the village.

Portland, Ore.—A franchise has been granted to the United Railways Company for the construction of its line to Mt. Calvary and Hillsboro, Ore. The company has one year in which to complete the work. A franchise also has been applied for to construct an electric line on the east 20 feet of the White House road to Riverview cemetery, the company agreeing to complete the line within two years or forfeit the franchise. E. E. Lytle, president, Portland, Ore. (Noted January 11.)

Pueblo, Colo.—The Pueblo & Arkansas Valley Electric Railway Company has secured an extension of time in which to start construction work on its proposed interurban line from Pueblo, Colo., to points in the Arkansas valley. The delay is said to have been caused by the inability of the company to secure right of way owned by various holders near Pueblo. (Noted December 28, 1907.)

Redding, Cal.—The franchise of the Redding & Red Bluff Electric Railway is said to have been revoked by the board of supervisors because the time for beginning construction on its proposed electric line from Redding to Red Bluff, 33 miles, had lapsed. (Noted September 21, 1907.)

Springfield, Mass.—The Springfield (Mass.) Street Railway Company has presented to the city council petitions for six separate locations of track, including those on Federal and State streets, the latter affording trolley freight facilities for the United States armory. The locations are in accordance with the plans outlined before the board of aldermen a few weeks ago. A hearing of the petitions will be given on April 6.

Taylorville, Ill.—The St. Louis Terre Haute & Quincy Traction Company has secured a franchise in Taylorville for the operation of its interurban line in that city. Most of the right of way in Christian county has been secured. Edward Yates, Pittsfield, Ill., is president. (Noted December 28, 1907.)

Wilmington, Del.—The People's Railway Company has applied for a franchise to build an electric railway from Seventh and Church to Fourth and Church streets, Wilmington, connecting with the boats of the Wilmington Steamboat Company. R. W. Crook, general manager, Wilmington.

RECENT INCORPORATIONS.

Baltimore & North Branch Railway, Baltimore, Md.—This company has applied for a charter for an electric railway from Woodlawn, near the city limits of Baltimore, Md., between Windsor Mills and Libertypike, to Hebbville, Randallstown and Long Branch. It is proposed to carry both freight and passengers. The line will connect with the Woodlawn line of the United Railways & Electric Company, which will be asked to operate the line on its completion. The road is being promoted by property-holders along the route and arrangements for securing right of way have been made. Capital stock, $50,000. Incorporators: B. J. Vlack, Emory George, H. M. Benzinger, Isaac Price, James Bosley and George D. Lynch.

Calumet & South Chicago Railway, Chicago, Ill.—Incorporated in Illinois to effect a consolidation of the South Chicago City Railway and the Calumet Electric Street Railway, under the provisions of a new franchise extension ordinance now pending before the Chicago city council. Capital stock, $1,000. Incorporators: L. A. Bushy, H. P. Weber and E. B. Hamilton.

Interstate Traction Company, Jersey City, N. J.—Incorporated in New Jersey to operate steam and electric railways, etc. Capital stock, $200,000. Incorporators: G. R. Warner, B. S. Mantz, A. C. Baer.

Irwin & Herminie Street Railway.—Incorporated in Pennsylvania to construct an electric railway between Irwin and Herminie, Pa., 5½ miles. Construction is to be started at once. Capital stock, $35,000. Holman B. Lynn, president, Pittsburg, Pa.

Jefferson Interurban Railway, Jefferson, Ia.—Incorporated in Iowa to build an interurban railway from Jefferson to Des Moines and Perry. Two routes are under advisement, one by way of Bagley to a connection with the proposed Des Moines & Sioux City Railway of Lake City, Ia., and the other by way of Ft. Dodge Junction and Paton connecting with another proposed electric line out of Ft. Dodge. Capital stock, $10,000. Incorporators: Albert Head, president; Henry Haag, vice-president; Mahlon Head, treasurer. P. L. Cockerill, E. H. Carter, S. J. Sayers, Judge Z. A. Church, J. M. Forbes, A. D. Howard and Fred E. Gamble, are the directors. (Noted February 29.)

Marlam Construction Company.—Incorporated in Kansas to build the Kansas City & Kansas Southwestern Electric Railway (noted March 14), connecting Topeka, Kansas City, Independence and Lawrence, Kan. It is stated that work will be started at once. Capital stock, $500,000. Incorporators: J. E. Martin, Minneapolis; E. M. Lambkin, Kansas City; W. L. Moyer, New York; W. Laming, Tonganoxie; S. W. Brewster, Chanute, Kan.; H. E. Hopper, Indianola, Ia.; C. S. Dudley, Minneapolis, Minn.

Oregon Rapid Transit & Power Company, Jacksonville, Ore.—Incorporated in Oregon to construct and operate electric railways serving the entire Rogue river valley. According to present plans the northern and southern termini of the line will be at Grant's Pass and Ashland, respectively, connecting the towns of Woodville, Gold Hill, Tolo, Central Point, Medford, Phoenix, Talent, Jacksonville and Eagle Point. Officers will be elected this week and engineers started on the survey of the line in the near future. Capital stock, $3,000,000. Incorporators: J. E. Watt, F. E. Metrick, F. E. Page, A. S. Bliton, S. A. Nye, F. L. Evans.

United Railways, Jersey City, N. J.—Incorporated in New Jersey to operate steam and electric railways. Capital stock, $200,000. Incorporators: John R. Turner, H. O. Coughlan, L. H. Gunther.

TRACK AND ROADWAY.

Ardmore (Okla.) Traction Company.—It is announced that tracklaying on this company's 2¼-mile extension to its summer park will be started as soon as the rails have arrived. Most of the trolley poles have been erected and the ties are now being distributed. J. F. Robinson, general manager, Ardmore. (Noted February 8.)

Asheville & Hendersonville Railroad, Asheville, N. C.—Engineers are said to be making surveys for this proposed line from Asheville to Hendersonville, N. C., 22 miles, work on which has progressed to a point beyond Hillgrit, N. C. C. F. White, Skyland, N. C., is interested. (Noted January 11.)

Athens & Anderson Electric Railway, Hartwell, Ga.—This company will make surveys at once for an electric railway 73 miles long, through Carnesville, Hartwell, Cannon and Iler, Ga. W. L. Hodges of Hartwell is interested.

Baltimore & Washington Transit Company, Washington, D. C.—The senate has passed a bill authorizing this company to extend its lines in the District of Columbia.

Chicago Kankakee & Champaign Electric Railway.—It is stated that work on this proposed line will be started this spring. A survey of the route has been made and right of way is being secured. When completed direct communication by trolley from Champaign to Chicago will be afforded. F. B. Vennum, Champaign, Ill., is interested. (Noted December 21, 1907.)

Chicago South Bend & Northern Indiana Railway, South Bend, Ind.—This company has a large force of men at work on its 27-mile extension from South Bend to Laporte, Ind.

During the summer the company will open a park at Chain lakes, seven miles west of South Bend, on the line of the new extension, which will be one of the largest of its kind in northern Indiana. Samuel Riddle, general manager, South Bend. (Noted February 29.)

Corsicana-Palestine Interurban Railway, Corsicana, Tex.—This company, after an inactivity of about five months on account of the financial situation, is preparing to begin construction on its line between Corsicana and Palestine, Tex., 58 miles. Surveys will be made and it is expected that the final location of the route will be adopted by April 15.

Denver & Interurban Railway, Denver, Colo.—Work on this line is being pushed, and it is expected that regular service will be started between Denver and Boulder, Colo., by June 1. The cars will operate from Globeville to Denver over the tracks of the new Globeville line of the Denver City Tramway Company, which it is expected will be completed within 60 days. Most of the poles for the Denver & Interurban line have been set and the wire is being strung. The cars will be 55 feet long with four 125-horsepower motors and will run hourly from Denver to Boulder. It is expected to use the new electric line for the local traffic, the express traffic being cared for by the Colorado & Southern steam road, the owner of the new interurban line. The interurban company will operate the Eldorado Springs (steam) Railway from Marshall to the summer resort at Eldorado Springs, Colo., which it recently purchased and electrified. This line also will be ready for operation this summer. E. E. Hartman, superintendent, Denver. (Noted February 15 and 29.)

Elizabethtown & Florin Street Railway.—This company has filed notice with the state department at Harrisburg, Pa., of an extension of route. The extension will pass through Florin, Mt. Joy, Rheems and Elizabethtown, seven miles, with a terminus at Middletown, Pa., where connection with the Central Pennsylvania Traction Company's lines will be made. It is expected that work will be started about April 1. The company is capitalized at $220,000. It is stated that the Conestoga Traction Company, Lancaster, Pa., will lease the line upon its completion. The officers are: W. W. Griest, president; C. Edgar Titzel, manager; J. S. Graybill, Jr., secretary and treasurer; H. W. Crawford, chief engineer; all of Lancaster, Pa.

Franklin & Towamensing Street Railway, Slatington, Pa.—This company is said to have completed surveys and secured most of the right of way for its proposed electric line from Slatington to Bowmans, by way of Lehighton and Palmerton, Pa. Construction work will probably be started late in the spring or early in the summer. A. P. Berlin, president, Slatington. (Noted February 1.)

Ft. Smith Checotah & Shawnee Interurban Railway, Checotah, Okla.—R. G. Smith, vice-president and general manager, states that this company, recently incorporated to build an electric railway from Ft. Smith, Ark., to Shawnee, Okla., is now considering propositions from several engineering companies to make the surveys. (Noted January 11.)

Gray's Harbor Railway & Light Company, Aberdeen, Wash.—It is stated that this company will make extensive improvements to its city and interurban lines during the coming summer. Jay D. Crary, general manager, Aberdeen.

Interborough Rapid Transit Company, New York.—This company is building an elevated extension of the Broadway subway line from Two Hundred and Thirtieth street to Van Cortland Park, one mile; also a subway extension from Borough Hall, Brooklyn, to Atlantic avenue, 0.89 mile.

Lawton Denton & Dallas Electric Railway, Dallas, Tex.—S. E. McCully, secretary and general manager, states that the plans for building this proposed 80-mile electric railway are being revived and that money has been secured for obtaining right of way and doing the preliminary work.

Lederachville & Pennsburg Traction Company.—This company is said to have awarded contracts for the construction of two concrete bridges, one of which will cross Branch creek near Lederachville and the other over Swamp creek at Sumneytown, Pa., on the route of its proposed electric railway from Lederachville to Pennsburg, Pa.

Ohio Electric Railway, Cincinnati, O.—The contractors are about to resume work on the completion of the Lima-Toledo line, between Deshler and Waterville only a portion of the track has been laid and there is a considerable amount of tracklaying to be done between Waterville and Toledo. The 1,200-foot concrete bridge over the Maumee river is completed, except for the approaches. F. T. Hepburn, district manager Lima, O. (Noted March 7.)

Los Angeles (Cal.) Railway.—A large force of men under the direction of George Kuhrts, chief engineer, has begun the construction of the line from Riverside to Colton, Cal.

McMinnville, Tenn.—John Henderson of this city is interested in a proposed electric railway from Cincinnati to Huntsville, Ala., by way of Nashville, Woodbury and McMinnville. Surveys for the line were made some time ago and work was started on a dam at Caney Fork Falls, from which power for the operation of the line was to be secured. This work was abandoned on account of legal complications, which are now said to have been settled. It is stated that $138,000 has been subscribed by Cannon county.

Oregon Electric Railway, Portland, Ore.—W. S. Turner of New York has been sent to Portland by the engineering firm of W. S. Barstow & Co. to take charge of the construction of the extension from Portland to Hillsboro and Forest Grove.

Philadelphia Rapid Transit Company.—Tracklaying has been started in the section of the Market street subway east of Eighth street.

Pittsfield (Mass.) Street Railway.—It is reported that construction will begin this spring on the extension from the present terminus of the Pittsfield lines to the New York-Massachusetts state line, a part of the proposed connection between Albany and Pittsfield.

Portland (Ore.) Railway Light & Power Company.—It is stated that this company will build a double-track extension to its east side interurban lines, commencing at a point near the Southern Pacific main line at the Inman-Poulsen mill, north to Hawthorne avenue and from there westward across the Madison street bridge. By this means the heavy passenger traffic will be carried around the company's freight yards instead of through them, as formerly. B. S. Josselyn, president, Portland, Ore.

Pottstown & Reading Street Railway, Pottstown, Pa.—It is understood that this company is planning an extension to Linfield, Pa., surveys for which have been made. Work will be started during the summer. Harry Sweinhart, general manager, Pottstown.

St. Louis Terre Haute & Quincy Traction Company, Springfield, Ill.—This company, which was incorporated last year to build an electric railway from Terre Haute, Ind., to Quincy, Ill., has purchased the property of the Virden & Taylorville Railway and the Roodhouse & Virden Traction Company, including right of way which will be used for a portion of the line between Taylorville and Quincy, Ill.

St. Tammany & New Orleans Railway & Ferry Company.—It is stated that this company will shortly let contracts for material and equipment for its proposed electric line connecting Covington, Abita Springs and Mandeville, La., 18 miles. Clay Riggs, Covington, La., president. (Noted December 14, 1907.)

Santa Ana Tustin & Huntington Beach Railroad.—Plans for the building of an interurban line from Tustin to Santa Ana and Huntington Beach, Cal., which were submitted to the Chamber of Commerce and the Merchants & Manufacturers Association of Santa Ana, have been endorsed by those bodies and committees have been appointed to secure the necessary capital, all of which it is stated will be supplied by local business men. The road will afford a through route to the beach and to the peat lands in the vicinity of Huntington Beach, and will be operated by gasoline motor cars.

Sheridan, Wyo.—S. A. Broadwell, Omaha, Neb., representing eastern capitalists, has applied for a franchise to build an electric railway in Sheridan, agreeing to have part of the line in operation by next fall. The road will connect the large coal camps in the vicinity with this city. It is stated that power for the operation of the line will be secured from Big Goose Falls as well as from an auxiliary steam plant to be installed at one of the mines. Mr. Broadwell obtained a franchise last fall from the council of Thermopolis, Wyo. (Noted October 26, 1907.)

Spokane & Inland Empire Railroad, Spokane, Wash.—It is reported that 14 miles have been graded and ½ mile of track laid on the extension from Palouse, Wash., south to Moscow, Idaho, 15.5 miles. Grant, Smith & Co. of St. Paul, Minn., have the contract. (Noted February 15.)

Springfield (Mass.) Street Railway.—It is stated that this company has under way plans for an extension of its line on East street in Chicopee, Mass. A franchise will be applied for as soon as the plans have been completed. H. C. Page, general manager, Springfield, Mass. (Noted January 11.)

United Traction Company, Albany, N. Y.—It is expected that work on the extensions of the east side line in Upper Rensselaer will be started by this company by April 1 or April 15. The material has been ordered and as soon as it arrives, a large force of men will be put to work with a view to having the improvements completed and in operation by next fall. (Noted December 28, 1907.)

Utica & Mohawk Valley Railway, Utica, N. Y.—This company expects to build a ½-mile extension in Rome, N. Y., this spring if conditions warrant.

West Chester & Wilmington Electric Railway.—This company, which has been chartered to build an electric railway 17 miles long between West Chester, Pa., and Wilmington, Del., with the right to operate in both states, will be practically an air line south from West Chester and will be on private right of way parallel to and adjoining the old concrete turnpike. Seventy-pound T-rails will be used. The overhead construction will be of the bracket type, using No. 0000 copper wire. Double-truck semi-convertible cars will be operated. Freight traffic also will be handled. Thomas E. O'Connell, president, Wilmington, Del. (Noted February 22.)

York & Shrewsbury Electric Railway.—This company has commenced the survey for its proposed electric line from York to Shrewsbury, Pa. D. B. Goodling, president, Loganville, Pa.; J. H. Keller, secretary, Shrewsbury; S. M. Manifold, chief engineer, York, Pa.

POWER HOUSES AND SUBSTATIONS.

Albany & Hudson Railroad, Albany, N. Y.—R. H. Smith, general manager, writes that a contract has been let to the Babcock & Wilcox Company for a 550-horsepower boiler to be installed in the power house at Stuyvesant Falls, N. Y. The W. K. Mitchell Company of Philadelphia will make the necessary pipe changes and the Ehret Magnesia Manufacturing Company will supply the pipe covering. (Noted March 7.)

Connecticut Company, New Haven, Conn.—This company has contracted with the Hartford Electric Company for a supply of power for the lines in New Britain, Berlin and Plainville, Conn., from its power plant at Dutch Point.

Gray's Harbor Railway & Light Company, Aberdeen, Wash.—This company has recently completed a $250,000 power station located between Hoquiam and Aberdeen, Wash. J. D. Crary, general manager, Aberdeen. (Noted November 16, 1907.)

Houghton County Street Railway, Houghton, Mich.—This company is said to be preparing plans for the construction of a power station at Laurium, Mich. W. H. McGrath, manager, Houghton, Mich.

Lewiston Augusta & Waterville Street Railway, Lewiston, Me.—It is announced that this company will erect a transmission line from the power plant now under construction on the Sebasticook river to Winslow and Lewiston, 36 miles, for which franchises have been obtained in Vassalboro, Sidney, Augusta, Manchester, West Gardiner and Litchfield. The company has leased for 99 years the power plant of the Fort Halifax Power Company in Winslow, Me., and has recently let contracts for the construction of two substations, one at Vassalboro and the other at Monmouth. E. D. Reed, general manager, Lewiston, Me. (Noted February 22.)

Pittsburg & Butler Street Railway, Pittsburg, Pa.—This company is reported to be installing a new turbo-generator in its power station at Renfrew, Pa.

San Bernardino Valley Traction Company, San Bernardino, Cal.—This company has awarded a contract to the Pacific Light & Power Company to furnish power for the operation of its lines. Power will be supplied from the power plant at Santa Ana canyon to two substations at San Bernardino and at Arrowhead.

Veblen (S. D.) Traction Company.—It is reported that this company, recently incorporated to build an electric railway from Lidgerwood, N. D., to Veblen, S. D., will begin construction work this spring. H. P. Hammersbach of Veblen is president and George F. Anderson of Veblen is secretary.

West Chester & Wilmington Electric Railway.—This company, which owns charters to operate an electric railway in both Pennsylvania and Delaware, will build a brick power house at Brandywine Summit, the central location of the line. Two 500-kilowatt generators will be installed connected to Corliss engines, together with an equipment of water tube boilers. Thomas E. O'Connell, Wilmington, Del., is president.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis.—It is announced that a 2,500-horsepower engine will be installed in the power house at Racine, Wis.

Personal Mention

Mr. Frederick L. Hutchinson has been appointed assistant secretary of the American Institute of Electrical Engineers, with office at New York City.

Mr. Francis S. Peabody of Chicago has been elected president of the Mattoon City Railway, Mattoon, Ill., succeeding Mr. E. A. Potter, resigned.

Mr. Daniel K. Harrington has been appointed superintendent of the Hamburg and Orchard Park line of the Buffalo Southern Railway, Gardenville, N. Y.

Mr. Howard M. Bougher has been elected president of the Burlington County Railway, Mt. Holly, N. J., succeeding his father, Josia K. Bougher, who died recently.

Mr. F. A. Burkhardt, division passenger and freight agent of the Ohio Electric Railway, at Lima, O., has had his jurisdiction extended over the lines from Dayton to Toledo and from Lima to Ft. Wayne and Defiance, O.

Mr. Frank M. Lott has been appointed master mechanic of the Green Bay Traction Company, Green Bay, Wis. Mr. Lott formerly was chief wireman of the southern division of the Public Service Corporation of New Jersey.

Mr. A. F. Schoepf, superintendent of the Columbus Grove City & Springfield line of the Ohio Electric Railway at Columbus, O., has had his jurisdiction extended over the Dayton Springfield & Urbana line, succeeding Mr. M. J. Loftus.

Mr. E. W. Hendershot has been appointed to the new position of comptroller of the Illinois Traction System at Champaign, Ill. Mr. Hendershot has been for several years auditor of agencies for the Sun Life Assurance Company of Canada at Montreal.

Mr. Harry McColgin, heretofore general freight agent of the Indianapolis Columbus & Southern Traction Company, Columbus, Ind., has resigned to become auditor of the Indianapolis & Louisville Traction Company, with headquarters at Scottsburg, Ind. Mr. Thomas C. King will succeed him as general freight agent at Columbus.

Mr. Wayne Hendricks, who has been connected with the Winnebago Traction Company, Oshkosh, Wis., since 1900, has been appointed superintendent of the Sterling Dixon & Eastern Electric Railway, Dixon, Ill., succeeding Mr. Lee H. McCray, who has resigned to accept a position with the Atlantic Shore Line Railway, Portsmouth, N. H.

Mr. A. A. Barnes has been elected president of the Indianapolis Crawfordsville & Western Traction Company of Indianapolis, Ind., succeeding Mr. A. E. Reynolds, resigned. Mr. A. M. Hewes, of the Electrical Installation Company, Chicago, Ill., which is operating the road, has been appointed general manager and Mr. A. H. Stocking has been appointed acting manager.

Mr. Ward Hubbard, formerly assistant superintendent of roadway of the Indiana Union Traction Company, has been appointed division superintendent with headquarters at Tipton, Ind., in charge of the lines between Indianapolis and Logansport, Kokomo and Peru, and Tipton and Anderson. He will be succeeded by Mr. A. Dunlap as assistant superintendent of roadway.

Mr. George E. Hamilton has been elected president of the Capital Traction Company, Washington, D. C., to succeed the late George T. Dunlop. Mr. Hamilton is a member of the law firm of Hamilton, Colbert, Yerkes & Hamilton, and has been a director of the Capital Traction Company for two years. Mr. D. S. Carll, for several years superintendent and chief engineer, has been elected to the newly created office of second vice-president and general manager.

Mr. C. S. Compton, chief engineer of the Northern Electric Company at Chico, Cal., has resigned, effective on April 1, to become president of the Paradise Polytechnic Institute of Paradise, Cal. Mr. Compton is a graduate of the Iowa State College and has had charge of the construction of the Northern Electric Company's lines since the preliminary work was started. He will be retained by the company as consulting engineer and in this capacity will direct the engineering work on the extensions now in progress.

The office of general master mechanic of the New York City Railway has been abolished with the resignation of Mr. Thomas Millen, which was announced in last week's issue. Mr. Alexander McIver has been appointed superintendent of equipment and will have charge of all the carpenter and paint-

ing work in connection with car repairs, in addition to his former duties as superintendent of electrical car houses, which position has been abolished. Mr. H. P. Clarke has been appointed master mechanic in charge of shops. He will have charge of the machine, plow and wheel shops of the system in addition to shops formerly under his jurisdiction as master mechanic of the One Hundred and Forty-sixth street electrical shops, which position has been abolished.

Mr. E. T. Munger, heretofore master mechanic of the Metropolitan West Side Elevated Railway of Chicago, has been appointed superintendent of motive power and equipment, effective on March 14, succeeding Mr. Benjamin H. Glover, whose title was superintendent of motive power. Mr. Munger was born at Mukwonago, Wis., in 1870. He graduated from the Menominee (Mich.) High School in 1886 and from the University of Wisconsin in 1892. After leaving college he entered the service of the Hall Signal Company as draftsman and was soon promoted to foreman of construction. He was then for two years connected with the National Switch & Signal Company at Chicago engaged in railway interlocking installation. From 1896 to 1898 he was construction foreman for the Metropolitan West Side Elevated Railway and from 1898 to 1899 he was general foreman of the Englewood & Chicago Railroad, an electric storage battery line in Chicago. In 1899 he went to Havana, Ill., as general manager of the Havana Electric Light & Telephone Company. On September 15, 1903, he was appointed master mechanic of the Metropolitan Elevated road, which position he has held until his present promotion. As superintendent of motive power and equipment, Mr. Munger has charge of the company's power house, substations, cars and car shops, as well as of the entire feeder and transmission system, storage batteries and the lighting and telephone system. His office will be at the Centre avenue shops, 146 Throop street.

Mr. Frank R. Henry has been elected vice-president and secretary of the Majestic Manufacturing Company of St. Louis, Mo., and expects to be actively engaged with that company shortly after April 1. This will necessitate his resignation as auditor of the United Railways Company of St. Louis. While Mr. Henry will sever his active connection with street railways, he will still be identified with the United Railways Company in the honorary capacity of president or vice-president of a number of its constituent companies. Mr. Henry was born and brought up in St. Louis and his active service with street railways in that city covers a period of 24 years. During that time there have been numerous changes in the street railways of the city, with four complete changes in management. Prior to the organization of the United Railways Company, Mr. Henry was auditor of the St. Louis Transit Company, the property of which was acquired by the United Railways. As the duties of Mr. Henry with the Majestic Manufacturing Company will require his undivided attention, he has found it necessary to resign as a member of the "classification" committee of the American Street and Interurban Railway Accountants' Association. Mr. W. B. Brockway has been appointed as his successor on that committee. Mr. Henry has not yet determined whether it will be necessary for him to resign from the office of president of the American Street and Interurban Railway Accountants' Association, to which he was elected at the annual meeting at Atlantic City in October of last year. He has been an active worker in the Accountants' Association and in the Street Railway Accountants' Association of America, which preceded the present larger and more influential organization.

Frank R. Henry.

OBITUARY.

William Jones, for a number of years general manager of the Oakwood Street Railway, Dayton, O., died last week. He had been connected with the company in various capacities for the past 35 years, starting in as a carpenter and rising through successive promotions to the position of general manager and superintendent of tracks.

Financial News

American Light & Traction Company, New York.—At the annual meeting of stockholders, George Blumenthal was elected a director to succeed L. H. Withey.

Boston Elevated Railway.—W. A. Bancroft, the president, has issued a statement saying that the company does not consider that it is its duty at the present time to press house bill 613 against any substantial opposition, and it will, therefore, request the committee on street railways to withdraw the bill. The statement gives the following reasons, however, why the bill should be enacted: "The Boston Elevated Railway owns the terminal railway of the metropolitan district. Other street railway lines run in from different points in the metropolitan district to connectons with the company. The company can, in connection with its own properties, manage at least some of these tributary lines with greater economy and give better public service than is being done at present. The simplest and best way would undoubtdly be for the company to consolidate with or lease such lines. That cannot be done without extending the 5-cent fare beyond all reasonable limits. The only way in which the public can obtain the advantages arising from the management by the company of tributary lines is by permitting the company to acquire the stock of such lines. By requiring in each case a previous determination by the railroad commission that such purchase is in the public interest the rights of the public are safeguarded, and any danger of the abuse of the power given to the Boston Elevated Railway is eliminated. The company believes that the acquisition of tributary surface lines by the main terminal company of the metropolitan district is for the public benefit and along the line of modern development in other large centers."

Camden (W. Va.) Interstate Railway.—Stockholders have voted to change the name of this company to the Ohio Valley Traction Company and to issue $400,000 of preferred stock. It is reported that the preferred stock will be used for the purpose of acquiring control of the Kanawha Valley Traction Company, Charleston, W. Va.

Central California Traction Company, San Francisco, Cal.—An assessment of $5.00 a share has been announced on the stock.

Charleston & Summerville Electric Railway, Summerville, S. C.—A committee has approved a plan for completion of the road. To provide the $600,000 which it is estimated will be required to finish the main line, subscriptions are being received for an issue of about $600,000 bonds. Existing claims will be liquidated with an issue of preferred stock at par.

Chicago Railways Company.—Holders of the stocks of the Chicago Union Traction Company and the underlying companies will be assessed $905,078 on account of the expenses of reorganization, including the sale of the property to the Chicago Railways Company. Union Traction preferred stock is to be assessed $3.33 a share and the common stock $1.00 a share. Underlying stocks owned outright by the Union Traction Company are not to be assessed, but independent holders of the underlying stocks must make payments as follows: West Chicago Street Railroad stock, $1.28 a share; Chicago West Division Railway stock, $7.65 a share; North Chicago Street Railroad stock, $1.98 a share; North Chicago City Railway stock, $7.65 a share.

Dayton & Xenia Transit Company, Dayton, O.—Upon application of the Worcester (Mass.) Trust Company, Judge Albert C. Thompson of the United States district court at Cincinnati appointed, on March 12, C. J. Ferneding, president of the company, as receiver. The application stated that the interest due in 1906 and 1907 on the second mortgage 5 per cent bonds was in default. The trust company is trustee under the mortgage securing those bonds. The Transit Company operates 51 miles of track from Dayton to Xenia and from Dayton to Spring Valley. The company was formed in 1901 to acquire the properties of the Dayton & Xenia Traction Company and the Rapid Transit Company of Ohio. The outstanding stock is $800,000 and the outstanding bonds aggregate $800,000, of which $500,000 are first mortgage bonds.

Delaware & Hudson Company, Albany, N. Y.—Holders of 4 per cent debenture bonds of this company have gone into court in an effort to enjoin permanently the payment of the regular quarterly dividend of the stock of this company. They have attacked the purchase of control of the Hudson Valley Railway of Glens Falls, N. Y., and of various coal lands.

Interborough Rapid Transit Company, New York.—The New York public service commission, first district, held a

hearing on March 16 on the application of this company for approval of the proposed mortgage securing an issue of $55,000,000 bonds. E. F. J. Gaynor, auditor of the company, testified that the Brooklyn subway extension cost $10,066,205 in excess of the amount paid by the city of New York. This was paid by the Rapid Transit Subway Construction Company. On December 31, 1907, the Interborough Company owed the Subway Construction Company $7,431,306. Since that date the Interborough Company has advanced to the Construction Company about $3,000,000, leaving a balance still due of approximately $4,431,306. William M. Ivins, special counsel for the commission, suggested that the company submit a schedule of its capital requirements during the year so that they could all be considered at once. The hearing was adjourned until March 28.

Lackawanna & Wyoming Valley Rapid Transit Company, Scranton, Pa.—Judge Young of the United States circuit court, Pittsburg, has authorized the receivers of the Westinghouse Electric & Manufacturing Company to pay the interest due on February 1 on $6,000,000 first mortgage bonds of the transit company, held by a trust company as collateral for a loan.

Lehigh Valley Transit Company, Allentown, Pa.—The Philadelphia stock exchange has listed $323,575 additional preferred stock voting trust certificates and $217,250 additional common stock voting trust certificates.

Massachusetts Electric Companies, Boston.—Shareholders of the Old Colony Street Railway, a controlled line, have voted to apply to the Massachusetts railroad commission for approval of an issue of $750,000 stock. Stockholders of the Boston & Northern Street Railway, another controlled property, voted to apply to the commission for approval of an issue of $1,250,000 stock.

New York City Railway.—The receivers have filed a petition with the state board of tax commissioners asking that the special franchise taxes be reduced. The substance of the petition follows: The New York City Railway became the lessee of the system in 1902, and ever since that time in each year the property as a whole has never been a paying one, and each year the company has faced and paid an increasing deficit. The defaults in interest or guaranteed rentals under the receivership aggregate $7,481,245. The changes in gross earnings of the surface lines and passenger traffic since 1902 have been as follows:

Year.	Revenue passengers.	Transfer passengers.	Gross earnings.
1903	396,243,922	158,626,750	$21,864,835
1904	389,608,537	168,267,818	21,865,899
1905	374,258,395	168,957,760	21,305,421
1906	391,354,877	178,639,866	22,362,688
1907	376,629,571	194,765,342	21,874,630

An analysis of the income account for the year ended June 30, 1907, is presented, constructed on the theory that in the current fiscal year the company should provide for special franchise taxes, for which only partial provision has been made in the past; an adequate depreciation fund, not included heretofore; and should offset from the 1906-07 earnings an amount equivalent to the estimated shrinkage in gross earnings and increase in operating expenses for the present fiscal year. The figures follow:

Gross earnings, year ended June 30, 1907	$21,874,630.72
Operating expenses and maintenance, excluding interest, rentals, taxes and depreciation	13,172,571.03
Taxes, including special franchise taxes as claimed by the state equalized at 89 per cent	2,039,355.91
Balance	$ 6,662,703.78
Deduct—	
Estimated decrease gross earnings for 1908	1,100,000.00
Estimated increase operating cost for 1908	1,000,000.00
Depreciation	3,000,000.00
Balance applicable to return on investment	$ 1,562,703.78

The fixed charges on the New York City Railway system, which were met up to last September, were in excess of $12,000,000. This sum included the $7,481,245 of guaranteed rentals and interest now in default.

Oneonta & Mohawk Valley Railroad, Oneonta, N. Y.—Gross earnings in the quarter ended December 31, 1907, were $41,173, an increase of $5,254 over the corresponding quarter of the previous year. Operating expenses were $42,655, an increase of $4,696. The net deficit was $2,482 as compared with a deficit of $3,040. The final deficit, after payment of fixed charges, was $13,651 in the 1907 quarter as compared with $14,136 in the 1906 quarter.

Rutland (Vt.) Railway Light & Power Company.—Gross earnings in the year ended February 29, 1908, were $253,112, expenses were $143,162 and net earnings were $109,950. Gross earnings of the railway department in this period were $105,561, expenses were $57,822 and net earnings were $47,739.

Syracuse (N. Y.) Rapid Transit Company.—Gross earnings in the quarter ended December 31, 1907, were $326,478 as compared with $293573 in the corresponding quarter of the previous year. Expenses were $241,875 as compared with $181,976. Net earnigs were $84,603 as compared with $111,597. The final surplus after provision for fixed charges was $1,762 in the 1907 quarter as compared with $22,191 in the 1906 quarter.

Utica & Mohawk Valley Railway, Utica, N. Y.—Gross earnings in the quarter ended December 31, 1907, were $272,418 as compared with $257,527 in the corresponding quarter of the previous year. Expenses were $159,500 as compared with $159,731. Net earnings were $112,918 as compared with $97,796. The final surplus after the payment of fixed charges was $65,200 in the 1907 quarter and $49,732 in the 1906 quarter.

Westchester Traction Company, Ossining, N. Y.—Edward G. Benedict was appointed receiver for this company on March 13 by Judge Ward of the United States circuit court, New York, following proceedings instituted by the Industrial Construction Company of Delaware, to recover $32,059 advanced to the traction company. The company admitted its indebtedness and its inability to pay the amount at present. The company formerly operated an electric railway in Ossining, but its franchise was declared void last year.

December—	1907.	1906.
Gross earnings	$33,195.33	$28,903.44
Operating expenses and taxes	19,501.05	17,143.01
Net earnings	13,694.28	11,760.43
Interest charges	6,584.30	6,213.90
Balance	7,109.98	5,546.53

Dividends Declared.

American Cities Railway & Light Company, New York, preferred, quarterly, 1½ per cent.

Houghton County Street Railway Company, Houghton, Mich., preferred, 3 per cent.

Manhattan Elevated Railway, New York, guaranteed, quarterly, 1¾ per cent.

Ridge Avenue Passenger Railway, Philadelphia, quarterly, 6 per cent.

St. Joseph (Mo.) Railway Light Heat & Power Company, preferred, quarterly, 1¼ per cent.

Seattle (Wash.) Electric Company, preferred, 3 per cent.

Union Traction Company of Indiana, Anderson, Ind., preferred, 2½ per cent.

West End Street Railway, Boston, common, 3½ per cent.

Winnipeg Electric Railway, quarterly, 2½ per cent.

Manufactures and Supplies

ROLLING STOCK.

Chicago Lake Shore & South Bend Railway, South Bend, Ind., is asking prices on four double-truck cars.

New York City Railway is asking prices on 150 new cars of its standard type and 100 pay-as-you-enter cars.

Ardmore Traction Company, Ardmore, Okla., has ordered four double-truck interurban cars and two open cars from the McGuire-Cummings Manufacturing Company.

Illinois Traction System, Champaign, Ill., which was reported in the Electric Railway Review of March 7 to be asking prices on 60 cars, has placed an order with the Danville Car Company for 22 double-truck passenger cars.

New Orleans Railway & Light Company, New Orleans, La., which was reported in the Electric Railway Review of February 29 to be in the market for a number of cars, has placed an order with the McGuire-Cummings Manufacturing Company for 35 single-truck cars. Delivery is to commence in May.

New York New Haven & Hartford is in the market for a number of all-steel passenger cars, reported as 12, to weigh approximately 160,000 pounds and to be equipped with multiple-unit control for operation with alternating or direct current. It is reported that the order has been placed, but we are unable to verify this before going to press.

New Bedford & Onset Street Railway, Wareham, Mass., has placed an order with J. M. Jones' Sons for one express car, as reported in the Electric Railway Review of February 29. Delivery is to be made in May. The specifications include the following details: Length of body, 30 feet; over vestibule, 38 feet; length over all, 39 feet; width inside, 7 feet 4 inches; over all, 8 feet; height inside, 6 feet 6 inches; from sill to trolley base, 8 feet 9 inches; height track to trolley base, 11 feet 11 inches.

Chicago Railways Company on March 19 placed an order with the Pullman Company for 300 pay-as-you-enter type semi-convertible double-truck cars. Delivery is to commence in June. Fifty of the cars may be built of steel, but this has not yet been definitely decided. No orders for the special equipment have yet been placed. Included in the specifications are the following details:

Seating capacity .... 40 passengers	Length of body..... 32 ft. 5 in.
	Of platform .... 8 ft. 4½ in.
Weight ..... 52,000 lb.	Over all ..... 49 ft. 2 in.
Wheel base ..... 4 ft. 10 in.	Width over all ..... 8 ft. 6 in.
Height track to trolley base ..... 11 ft. 8 in.	
	Underframe ..... Composite

SHOPS AND BUILDINGS.

West Chester & Wilmington Electric Railway.—It is stated that this company will build a steel frame car barn with corrugated iron roof and sides. Thomas E. O'Connell, president, Wilmington, Del.

TRADE NOTES.

Westinghouse Air Brake Company has declared a quarterly dividend of 2½ per cent, payable April 10.

Frank F. Fowle announces the opening of an office in the Marquette building, Chicago, as a consulting electrical and telephone engineer.

Henry Tripp, who has been connected with the St. Louis office of the Westinghouse Machine Company, has joined the sales department of the Green Engineering Company of Chicago.

C. S. Hawley of the Consolidated Car-Heating Company at a recent meeting of the executive committee of the American Street and Interurban Railway Manufacturers' Association, was appointed chairman of the finance committee for the next annual convention.

Ridgeway Dynamo & Engine Company, Ridgeway, Pa., announces that it has opened a district sales office at 907 Andrews building, Cincinnati, O. George W. Enker, who has had extensive experience in electrical and power plant work, is in charge as manager.

Maryland Railway Supply Company of Baltimore City, the organization of which was reported in the Electric Railway Review of January 25, has changed its name to the Maryland Railway & Electric Supply Company. Several changes in the official personnel have also been made. Charles Elliott is now president and general manager, Nelson Perin, vice-president and Thomas D. Claiborne, secretary and treasurer. The general offices of the company will be retained at 510 Continental building, Baltimore.

Harold A. Clark, president of the Central Inspection Bureau, 17 State street, New York, died on March 7 at Phoenix, Ariz., of tuberculosis, and was buried in Detroit on March 16. He was also auditor and domestic sales agent of the Middletown Car Works.

Nathan Manufacturing Company, New York, has appointed Clifford Nathan general western manager. Mr. Nathan will make his headquarters at the Chicago office in the Old Colony building and will have charge of the Nathan Manufacturing Company's business in the west.

Canadian Crocker-Wheeler Company, Limited, has been incorporated with an authorized capital of $250,000 to manufacture metals and do a general foundry and machine business. The headquarters of this new branch of the Crocker-Wheeler Company of Ampere, N. J., are at Montreal, Que.

George R. Carr, vice-president of the Dearborn Drug & Chemical Works, Chicago, is on a combination business and pleasure trip to the City of Mexico. John W. Brashears, who for many years has been first assistant to W. A. Converse, chemical director of the company in charge of the analytical laboratories, has been appointed assistant superintendent of the manufacturing department.

Archbold-Brady Company, Syracuse, N. Y., has closed a contract with the Niagara Lockport & Ontario Power Company for four special crossings for the tension power lines over the tracks of the New York Central, and one for the Syracuse & South Bay Electric Railway. Hewlett strain insulators will be used, requiring five 10½-inch tube discs and three 6½-inch discs. The structures will be provided with a special device so that in case of a wire breaking it will be grounded and not left alive.

Toch Brothers, manufacturers and specialists in technical paints, colors, varnishes and raw materials, 320 Fifth avenue, New York, have the contract for painting the Metropolitan Life Insurance tower, which is now under construction in that city. This tower is being protected against chemical and electrolytic corrosion by means of two coats of paint, the priming coat being their Tockolith brand and the finishing coat their No. 110 R. I. W., which is waterproof. The company states that the application of these two coats of paint will do the work more effectually than the usual three coats applied to work of this character.

Chester Railway Supply Company of Chester, Pa., has been incorporated for $50,000 to manufacture and sell the Dyer improved trolley ear and other railway and electric supplies. The officers are: Elwood Tyson, president; William A. Dyer, secretary and treasurer; and H. G. Dyer, manager. The Dyer ear, as its name indicates, is a mechanical trolley ear of improved design, some of which have been in service for two years on the lines of the Chester Traction Company, with very satisfactory results. The ear is indorsed by officials of that company, is in use on other lines and is having a gratifying sale within the short time it has been on the market.

Expanded Metal & Corrugated Bar Company, St. Louis, reports that among the larger orders recently received are the following: Philippine government at Manila, 500 tons of corrugated bars for use on the island, purchased through Paul S. Carter, purchasing agent, New York; Hiram Lloyd Contracting & Building Company, contractor for the new high school at St. Louis, 500 tons corrugated bars; William A. Engeman, contractor for reinforced concrete retaining wall to be built at St. George Ferry Landing, Staten Island, N. Y., as part of plan for municipal improvements of Borough of Richmond, 600 tons corrugated bars.

Western Electric Company, Chicago, has issued its report for the year ended November 30, 1907. On December 1, 1906, the indebtedness of the company was $27,082,552, including a contingent liability of $4,201,189 for bills receivable discounted. The financial condition of the company, in the early part of the year, made curtailment of expenses necessary, so that the indebtedness could be materially decreased. The success of the efforts to meet the situation is shown by the fact that the indebtedness was decreased during the year $9,380,759, which, with an increase in cash of $1,147,425, makes an improved condition to the extent of $10,528,184. The sales were $52,724,168, as compared with $69,245,332 in the previous year, a decrease of 23.9 per cent. The amount charged off for depreciation, according to the usual practice, is more than three times the average amount of the previous three years, and exceeds that average by more than the

amount of the dividends. The total deductions from inventory costs of merchandise at the close of 1907 were about $2,000,000. From year to year, as the volume of the company's business has increased, decreasing shop costs have resulted and the practice has been followed of reducing prices to customers as lower costs have been attained. The large volume of business and the resultant lower shop costs in 1906 seemed to justify certain reductions in prices to customers. As a result certain important articles of the company's manufacture sold for lower prices in 1907, although costing more than in 1906. This accounts for a reduction of $335,000 in the profits for the year. At the end of the fiscal year 1906 the capital and surplus as reported were, in round figures: Capital, $15,000,000; surplus, $20,102,000; total capital and surplus on December 1, 1906, $35,102,000. If an adequate reserve for the decrease in value of the merchandise and for expenses incurred in 1907, but really applicable to the business of 1906, could have been foreseen and provided, the accounts for 1907 would have shown earnings sufficient for a dividend and a small addition to the surplus. The capital and surplus as reported on December 1, 1906, aggregated $35,102,000. If the depreciation on merchandise carried over from the abnormal year 1906 is figured at $934,000 and the expenses applicable to sales of 1906, incurred in 1907, at $395,000, making a total of $1,338,000, this would leave a capital and surplus of $33,764,000. The net earnings on 1907 sales were $1,217,000, and the dividends paid in 1907 amounted to $1,200,000, leaving $17,000 as addition to surplus from 1907 earnings, and making total of $33,781,000. The condensed statement of assets and liabilities December 1, 1907, is as follows:

Assets—	December 1, 1907.	Increase since December 1, 1906.
Plants (51.9 per cent of cost)	$11,817,905	$ 541,726
Merchandise	15,998,805	*6,184,111
Sundry investments	2,640,725	96,569
Cash	2,773,609	1,147,425
Bills and accounts receivable	18,252,060	*6,303,014
Grand total	$51,483,104	*$10,701,405
Liabilities—		
Capital stock issued	$15,000,000	
Surplus	18,781,311	*$ 1,320,646
Total capital and surplus	$33,781,311	*$ 1,320,646
Mortgages and bonds payable	$ 1,328,087	*$ 198,355
Pension fund	576,661	17,983
Bills payable	9,337,168	*6,427,724
Accounts payable	2,111,849	*2,919,502
Bills receivable discounted	4,348,028	146,839
Total payables	$17,701,793	*$ 9,380,759
Grand total	$51,483,104	*$10,701,405

*Decrease.

United Gas Machinery Company, incorporated under the laws of the state of New York with offices in the Engineering building, 114-118 Liberty street, New York City, has taken over the business formerly conducted by Thomas F. Fitzsimmons at 100 Broadway, and will manufacture a complete line of gas generators for making producer gas for gas engines and heating and water gas for high temperature furnaces, forges, annealing, etc. These generators gassify either bituminous or anthracite coal, and are simple, most efficient and economical in their operation. One of its soft coal gas producers has recently been installed at the S. S. White Dental Company's works at Staten Island. Thomas F. Fitzsimmons remains with the company as its president and general manager and his long experience in the application of producer gas to gas engines and water gas to furnaces insure to the purchaser the best possible results.

ADVERTISING LITERATURE.

Buckeye Engine Company, Salem, O.—A clever 4-page note in imitation hand-writing serves to call attention to the Buckeye electric blue printing machine.

Green Fuel Economizer Company, Matteawan, N. Y.—"Mechanical Draft" is the subject of Bulletin No. 108, recently published. A number of installations are described and illustrated.

Hart Steel Company, Elyria, O.—This company's 1908 catalogue of tie plates and spikes is an unusually handsome book of 48 pages and cover. The latter is embossed and decorated in green and gold. A number of fine half-tones illustrate different types of tie plates, while many pages are devoted to diagrams showing standard tie plates of various railways. A special envelope with a label of unique design is used for mailing.

American Casting Company, Birmingham, Ala.—A leaflet entitled, "Dollars and Sense," conveys reasons why the short-length lightweight cast-iron culvert pipe made by this company should be specified for railway use.

Western Electric Company, Chicago, Ill.—Bulletin No. 5910-2 devotes 20 pages to descriptions and illustrations of power equipment for boot and shoe factories.—Bulletin No. 5910-3 describes power equipment for cement mills and illustrates a number of installations.

General Electric Company, Schenectady, N. Y.—"G-I" flame arc lamps are described in a recently issued leaflet.—Bulletin No. 4561 is an interesting 16-page pamphlet on illumination. It contains a large number of illustrations of the "GLM" lamps and of fixtures especially suited for their installation.

PRESENT STEAM TURBINE DEVELOPMENT.

That the steam turbine is not losing ground in its rapid introduction into all classes of power service is evidenced by the following table showing the aggregate turbine business of the Westinghouse Machine Company at the beginning of the year, classified according to industries. The table shows a summary of 640,700 kilowatts in 493 machines, distributed among 282 plants.

In addition to this output there were at that time under construction at East Pittsburg 148 machines. These bring the grand total of the turbine business of this company up to the grand total figure of 864,300 kilowatts, or 1,253,000 brake horsepower, so that the 1,250,000-horsepower mark has been passed in the operations of the Westinghouse Companies alone.

Referring to the accompanying table rapid advancement in turbine installation for steam railroading is noted. Although there are comparatively few railroad electrification plants yet installed, their capacity is large—11,670 kilowatts per plant. An idea of the size to which modern central stations have grown is furnished by the fact that nearly 35 per cent of the total capacity tested is contained in stations of over 10,000 kilowatt capacity.

In this connection some data on the development of the Parsons type turbine for marine work in Europe are of particular interest. Sir William Matthews in his recent presidential address before the British Institute of Civil Engineers, cited the following facts:

"In the middle of the present year (1907) there were in service 61 steamships fitted with Parsons turbines and 65 vessels under construction to be furnished with them. The total horsepower of these ships approached 1,400,000. Of this about 42 per cent was in merchant vessels and yachts and 58 per cent in warships. In new ships of the Royal navy reciprocating engines have given place to turbines."

Summary of Westinghouse Turbines Shipped or on Order to December 31, 1907.

Electric Traction—	Plants.	Av. Cap. of turbines in kw.	Total capacity in kw.
Electric railways	69	1,975	282,600
*(Railroad electrification)	4	3,350	46,900
Total	73	.....	329,500
Electric Lighting—			
Central stations	73	1,440	180,100
Isolated plants	7	400	3,200
Municipal plants	11	570	8,700
Total	91	.....	192,000
Steam Railroads—			
Railroad electrification	4	3,350	46,900
*(Railroad car shops)	17	490	15,700
Total	21	.....	62,600
Industrial	81	.....	76,300
Mining and irrigation	19	686	21,950
United States government	4	1,225	12,250
Miscellaneous	14	483	8,700
Grand total	282	.....	640,700

*Industries in parentheses are allowed for in grand total.

The business uncompleted December 31, 1907, follows: 60 turbines of 153,550 kilowatts, total, leaving shipped or in operation 433 machines, or 487,150 kilowatts, averaging 1,122 kilowatts.

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

Positon as chief engineer and machinist wanted. Will go to responsible company on trial. Have had 25 years' practical experience. Address "No. 563," care of Electric Railway Review, Chicago.

Young man with four years' experience in office, drafting room, and field work, alternately, desires position as utility man with electric road, in east preferably. Address "No. 569," care of Electric Railway Review, Chicago.

Stenographer and office man with number of years' experience in railway supply business desires to secure position with good firm. Best reference. Would leave city. Address "No. 571," care of Electric Railway Review, Chicago.

Position as chief clerk or auditor by young single man with seven years' experience electric railway work. Good knowledge of operating departments; exceptional references. Address "No. 559," care of Electric Railway Review, Chicago.

Position wanted as track foreman by a reliable and practical construction man of many years' experience on both city and interurban roads. Can give good engineering reference; do not drink. Address "No. 565," care of Electric Railway Review, Chicago.

Officers of electric railway properties desiring services of an experienced operating superintendent, young, energetic and reliable, having successfully handled a 200-car system, are requested to address "No. 555," care of Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Wanted—A young man experienced in street railway and electric light accounting desires position as auditor. Best of references as to character and ability. Address "No. 573," care of Electric Railway Review, Chicago.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 568," care of Electric Railway Review, Chicago.

Accountant, first-class, desires position. Good executive ability and a strict business man. Can keep any kind of accounts render comparative statistical statements, and not afraid to go against anything. Make me an offer. Address C. K. Tilton, Suite A-1, Champion Bldg., Atlantic City, N. J.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

Master mechanic of undeniable ability and experience is at liberty to accept reasonable offer. Has had 15 years' experience in both steam and electric service. Has exceptional ability in equipping new rolling stock and handling shops and men on economical basis. Address "No. 560," care of Electric Railway Review, Chicago.

Position as superintendent or assistant to general manager wanted. Eighteen years' experience in railway work. For the last six years have been superintendent of an electric railway company. Can get best of references from present employers. Can also give good reason for wishing to make change. Address "No. 572," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Park superintendent wanted. State experience and salary wanted; also give references. Address "No. 561," care of Electric Railway Review, Chicago.

Twelve offices, covering entire street railway and manufacturing world. 1,000 technical and office positions open. Confidential service; write today, HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

BUSINESS OPPORTUNITIES

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Don't throw away your old batteries. We have a preparation which will positively renew old dry batteries at the cost of two cents each. Trial package and electrical catalogue 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of July 20, 1904, and June, 1906. State condition and price. Address "No. 567," care of Electric Railway Review, Chicago.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

If interested in any phase of steam transportation, you will find every development covered fully and accurately in The Railway Age. It is the leader and acknowledged authority in this field. Ask for free sample copies. The Railway Age, 160 Harrison Street, Chicago.

A copy of "The Motorman and His Duties," the standard handbook on the theory and practice of electric car operation, is worth many times its cost to every man interested in the subject. Send for 16-page pamphlet of sample pages. The Wilson Company, 160 Harrison Street, Chicago.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the Interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts expunged from, and the parts added to the Interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

If You Have a Position for a High Grade Man

you can quickly secure his services in one of two ways

- by answering "Positions Wanted" advertisements on this page, or
- by advertising on this page under the heading, "Positions Open"

Foreign $5
Canada . . . $3.50

"How much does it cost?" is a question often expressed and always a fair one, too. If your company is not a member of the American Street and Interurban Railway Association and if you have any hesitancy about joining the association it would be well to read the booklet just issued outlining the purposes, plans and work of this body. In this attractive booklet are found answers to the questions of what good a membership will do your road and the heads of its departments, what the association and the affiliated bodies have done, what are the objects of the association, how it is organized and how much it will cost your road to receive the many benefits now accruing to its broadly scattered membership. The scope of the work is broad and you cannot well afford to stay outside.

Join the Association.

Suit was recently brought against the Chicago South Bend & Northern Indiana Railway because a passenger had littered the floor with peanut shells and, upon being asked by the conductor to desist, became abusive. This resulted in the ejection of the passenger from the car. The case, which was tried before a jury, ended in the judge sustaining a motion made by the defense to instruct the jury to bring in a verdict for the defendant. Thus the court upholds the right of an electric railway company to establish rules for preserving sanitary conditions on its cars, clothing the company with the right to enforce such rules. On the other hand, had the court favored a judgment for the ejected passenger, it would have discouraged electric railway companies from well-directed attempts to maintain their cars in a clean condition. Such attempts are made by the companies even though a large part of the traveling public seems to have no regard for the other portion which appreciates cleanliness.

The Courts Uphold Cleanliness.

It is particularly satisfactory to be able to note the apparent success of the pay-as-you-enter car in New York during the few days it has been in operation on the Madison avenue line. Its advent has been hailed with delight by all who are accustomed to use the line in their daily travels and on Sunday, the first day of its use, the cars narrowly escaped being swamped with eager patrons, with whom, however, curiosity was the controlling impulse. After several days it has not been possible to discover any serious objection to the use of this type of car, and the New York patron, who believes himself worse treated in the matter of transportation facilities than his fellow countryman anywhere, has taken most kindly to what seems the first attempt toward the amelioration of his condition. Whether he will take so kindly to a development of the system of handling fares which has been proposed is quite another question. Pleased with the success of the experiment in general, General Manager Oren Root now announces that as soon as the public has become fully accustomed to the new cars he will put in a nickel-in-the-slot machine for collecting fares. That the new cars have been received so considerately and have operated with so few instances of friction is a result of a careful campaign of education under which the company took its patrons into its confidence as to what it was going to do and stated clearly the assistance it expected from them. When the first car appeared most of its patrons knew how to use it. Since that time the correctness of the principle on which the car is arranged has been amply demonstrated, especially at the Grand Central station, where passengers enter and leave the cars in unusually large numbers. The only probable source of difficulty in making the use of this type of car general is the physical one of streets too narrow to afford room at intersections for the turning of cars of such length. But there are still a number of lines in New York on which this objection does not obtain. Because it is so the favor with which the cars have been received in their experimental service is of great importance.

Pay-As-You-Enter in New York.

It is a long step from the 22-account classification proposed by the interstate commerce commission for the use of roads having gross annual revenues of less than $50,000 to the classification with over five times as many accounts prescribed for those roads having larger incomes. We do not wonder at the protests now so frequently expressed against this definition of a large and a small road. Such protests, of course, carry the most weight when they are combined with suggestions as to how the dividing line can better be chosen. We publish such a suggestion this week. Among the communications to the editors presented in this issue the vice-president of a large metropolitan system suggests a method for defining companies entirely different from that of comparing the gross annual revenues. His suggestion is that companies can best be classified for this purpose according to the number of cars operated daily. With the companies rated according to serviceable cars it would be possible for the revenues to be increased without an expansion of the then existing classification. The number of employes of any company is closely proportionate to the number of cars operated, and, as nearly all companies might handle more passengers with the number of cars operated than they now do, there are attractive features in this method of rating.

Classifying According to Cars Used.

How important are some of the electric railroad installations that have recently been made or are now in progress, in comparison with steam railroads recognized as leaders in the matter of passenger business, was clearly shown by figures presented at the annual electrical meeting of the New York Railroad Club on March 20 by L. B. Stillwell, consulting electrical engineer for the Hudson Companies and the Interborough Rapid Transit Company. In this connection emphasis was laid upon the difference between the development of steam railroads from small beginnings to their present proportions—a development in capacity rather than an improvement in kind—and the bringing up from the horse-car era of an entirely new system of operation to a point where its trains equal or exceed the capacity of those hauled by the steam locomotive. In view of this, the status of development of electrical power is remarkable. Upon the basis

Comparing Steam and Electric Systems.

of the service performed in five weeks by the Brooklyn extension of the Interborough Rapid Transit Company—a line whose present terminus is such as to minimize the demands made upon it—and of that which has been performed in a shorter period by the Hoboken line of the Hudson Companies, it appears that the passenger miles of each of these two installations will annually exceed those of the New York New Haven & Hartford, the New York Central, nearly double the business of the Erie and be about equivalent to that of the Pennsylvania Lines East of Pittsburg. Most of these roads are exceptional in the volume of their passenger traffic. Additional complications are introduced into the operating problem owing to the limited distances over which the trains operate, requiring an average headway of about two minutes, and this with trains of a capacity exceeding that of the average steam railroad train. Electrical service appears to have arrived nearly at the standardization stage and the elements which make each separate installation more or less of an experiment have been materially diminished. The significance of this fact from an economic standpoint is of course proportionate to the magnitude of each individual installation and comparisons are therefore not merely the satisfaction of an idle curiosity.

LIVE AND DEAD TRAILERS.

There are many attractive reasons for using trail cars. Some of these reasons are quite general, applying to nearly all street railways. Trail car operation also must have its disadvantages or it would be more generally practiced throughout the country. We should like to learn of these disadvantages so that they may be weighed against the credits.

Notable among the electric railway systems which find trail and multiple car operation advantageous for city service are the Denver City Tramway, Columbus (O.) Railway & Light Company and the St. Joseph (Mo.) Railway Light Heat & Power Company. The equipments of the latter company are described and illustrated in this issue of the Electric Railway Review. It may be of interest to review briefly the types of motor and trail cars used on these three representative railways, outlining meanwhile the advantages of the combination service.

Referring to the illustrated description of the Denver cars presented in the Electric Railway Review for May 4, 1907, page 578, we find that these equipments, both motor and trailer, are notably light in weight per unit of seating capacity. Both motor and trail cars are provided with center side entrances and thereby differ from the types more common to eastern street railways. The motor cars are designed for high schedule speeds during the middle of the day when running as single units and thus have the necessary motor capacity to handle light trailers during the rush hours. The type of motor car thus used seats 52 passengers and weighs complete, equipped with four 43-horsepower motors, 38,000 pounds. The weight per unit seating capacity is 730.8 pounds.

There has been developed in Denver a trail car with probably as low weight per unit seating capacity as would be consistent with a proper regard for maintenance. The trailers are 38 feet long over all, 8 feet 2 inches wide over all and weigh complete but 13,000 pounds. They provide seats for 46 passengers, with a generous amount of standing space. This is a total weight per unit of seating capacity of 282.7 pounds.

In Denver the trail and motor cars are equipped with straight air brakes having the emergency features. Electric lighting is effected by a simple plug connection with the motor car. Trailer cars are used only as traffic demands them. Results of meter readings over long periods show that while the power required for motor cars only at a schedule speed of 10.3 miles per hour with six stops per mile is 2.8 kilowatt-hours per car-mile, the addition of trailers to these motors increases the power used by only 41.1 per cent or to 3.95 kilowatt-hours per train-mile. For this additional power the gain in seating capacity is from 52 to 98. The Denver Tramway service is trailer operation in the strict sense of the word. In Columbus, O., the rush-hour traffic is handled with 2-car trains, each car having a motor equipment and control system. The leading car of a train has type M control, while the rear car has a K-10 controller. The platform controller is not used, however, when the cars are coupled. Each car has two 40-horsepower motors. A bus line connects the motor circuits on the two cars so that multiple-unit operation is possible.

The leading car of tests recently made at Columbus weighed 34,366 pounds and had seats for 40 passengers. This car was 40 feet $8\frac{5}{16}$ inches long over vestibules. The second car of the train had like characteristics except that it was one foot shorter. In the tests mentioned with the running conditions as to speed, length of run, stops per mile, etc., approximately the same as those mentioned as average conditions for the Denver runs, each car of a train of two cars in Columbus consumed 3.04 kilowatt-hours per mile as compared with a consumption of 3.95 kilowatt-hours per train-mile for a motor and trailer in Denver. The seating capacities of the two trains were: Columbus, 80 passengers; Denver, 98. The salient feature of this comparison is that on the score of power no gain is to be expected from multiple-unit operation because the total weight of two motor cars will likely exceed the total weight of a motor car and a trailer. Other valuable features resulting from 2-car service are the same for 2-motor cars as for a motor car with a trailer.

The St. Joseph Railway Light Heat & Power Company has put into use a system of train operation which combines the desirable features of both the Denver and Columbus systems. It uses both "live" and "dead" trailers, as traffic conditions warrant, thereby obtaining the greatest possible flexibility in adjusting service to traffic. The live trailers used in St. Joseph are single-truck, long wheel base equipments, carrying two motors with neither trolley poles nor control equipments. Seven main power wires leading from the two motors on a trailer terminate in coupler heads on the dashes, so that by means of a jumper connecting with a similar head on the motor car the two motors on the live trailer may take power through the control system of a leading fully equipped motor car. The result is a train of two cars, the forward one of which receives current from the trolley wire and handles it through a multiple-unit control equipment designed for four motors, two motors of which are mounted on maximum traction trucks under the leading car; the two other motors are on the so-called "live" single-truck trailer.

Each type of car is provided with a straight air brake equipment, including emergency features, so that no danger from collision may arise in case of a parting of the train. The cars equipped with controllers also have the regular multiple-unit control train line with 9-point coupler heads, so that it is possible to operate them in trains of several units, each of the cars having two motors and its own set of contactors.

Still another combination is possible which comprises a motor car equipped with full control hauling a live trailer, and both in combination hauling an ordinary trail car without motors; or a "dead" trailer may be hauled, as is the customary practice with other roads.

The reasons for the success attained with these three kinds of cars are not far to seek. St. Joseph is not so large a city that traffic is congested except during special periods. These occur when the employes of the large packing houses go to and from their work and when the crowds on pleasure bent ride to and from the railway company's attractive park at Lake Contrary. During the periods of ordinary traffic the single cars equipped with two motors and multiple-unit control apparatus can satisfy the schedules in excellent shape.

When rush hours come or when the park crowds are to be moved the maximum schedule speeds are maintained by coupling five trailers with the motor cars and operating them as units either with or without a dead trailer as the traffic may demand. For high schedule speeds on suburban lines two straight motor cars may be operated in multiple.

Some of the advantages which may be set out to the credit of live and dead trailer operation seem worthy of mention. They are: Low investment per unit seating capacity; reduced idle investment during periods of light traffic; low insurance cost on account of the small number of electrical equipments; reduced necessity for covered storage because trailers have no equipment to become damaged by exposure; low maintenance cost because of fewer motors; less wear on special track work because of low average weight per seat; considerable reduction in power used per passenger carried (about 30 per cent) and its desirable resultant effect on the power station during rush-hour peak loads; a more uniform number of trains in crowded streets during the entire day; motormen not required for trippers, therefore a gain of 50 per cent in platform labor cost for the handling of the trailer loads; all of which tend toward better service at less cost per passenger carried.

INTERSTATE COMMERCE COMMISSION'S CLASSIFICATION OF ACCOUNTS.

The tentative classification of operating expense accounts for electric railways devised by the interstate commerce commission has been severely criticized because of the fact that it is based so largely on steam railway practice. In view of this some data as to how the classification for steam railways fits the steam railway conditions will be of interest. The interstate commerce commission's classification for steam railways in effect prior to July 1, 1907, had a total of 53 primary accounts; the new classification which has been in use since that date has 123 primary accounts. Analysis of the reports of two steam railways for the month of January, 1908, shows some rather startling facts as to what may be called the lack of symmetry of the new classification.

In the case of one of these roads, operating between 2,000 and 3,000 miles of main line, only 23 of the 123 primary accounts included as much as 1 per cent of the total operating expenses. Of the 100 accounts, each of which was less than 1 per cent of the total, six had no entries and 26 others were each less than 0.1 per cent, and of these 26 there were six each of which was less than 0.01 per cent of the total, two being less than 0.001 per cent. On the other hand the 23 accounts each of which included over 1 per cent of the total ranged from 1.04 per cent to 9.9 per cent, and 21 of them aggregated over 85 per cent of the total operating expenditures, the other account being a credit.

In the case of the other steam railway, which operates about 500 miles, only 29 of the 123 primary accounts exceeded in amount 1 per cent of the total. One of these was a credit item; the other 28 in the aggregate included nearly 95 per cent of the total operating expenses.

It must be apparent that when from one-fourth to one-third of the accounts aggregate four-fifths to nineteen-twentieths of the total amount involved, the system is sadly lacking in symmetry. The old standard of the Street and Interurban Railway Accountants' Association provided for 38 operating expense accounts, which in practice were subdivided as required to meet the needs of each company adopting the standard, and it appears to us that this plan of optional subdivision might better have been followed by the commission.

If the steam railway classification evolved after years of experience fits the steam lines so badly it is not surprising that a similar scheme when applied to the electric railways should fit them even worse.

Communications

CLASSIFICATION—SEPARATION OF BOILER HOUSE AND ENGINE ROOM EXPENSES.

To the Editors:

There is one feature of the tentative classification which I am certain could be revised with benefit to the industry. The accounts relating to generation of power, as outlined, do not follow in their natural order the physical processes involved in the production of electrical energy from fuel, and therefore are not in accordance with correct accounting principles.

The boilers and their accessories are devices for the production of steam from fuel only, and the boiler house expenses should be kept separate from those of the engine room. The function of the machinery in the boiler house is the conversion of the steam supplied to it into electrical energy.

The activities on one side of the boiler house wall are entirely distinct from those on the other, and the data of operating cost given separately would furnish a basis for discussion of the nature of equipment and other conditions of value to engineers and managers.

The accounts referred to are as follows: Under "maintenance of equipment," account No. 60, "power operating plant equipment," includes in the government classification: "Steam and water plant. Cost of materials used (less salvage) and labor expended in repairing and renewing steam and water plant equipment, including engines and engine parts, appliances and fixtures, belt tighteners and fixtures, receivers, lubricators and oiling devices, shafting, clutches, cranes, hoists and other engine room appliances, boilers, boiler fittings and appliances, furnaces, economizers, stacks, mechanical draft machinery, pumps, feed water heaters, purifiers, tanks, condensers, coal and ash conveying machinery, mechanical stokers and other boiler room appliances; piping and steam fitting, including valves, separators, water and sewer connections, and water meters." This should be separated into several accounts, as follows: Boiler plant—"Cost of materials used (less salvage) and labor expended in repairing and renewing boilers, boiler fittings and appliances, furnaces, economizers, stacks, mechanical draft machinery, pumps, feed water heaters, purifiers, tanks, coal and ash handling machinery, mechanical stokers and other boiler room appliances, cranes, belting, piping and steam fittings in boiler house, water and sewer connections and water meters, and all things used in generating steam from fuel." Engine room or water plant—"Cost of materials used (less salvage) and labor expended in repairing and renewing steam engine and water plant equipment, including engines and engine parts, appliances and fixtures, belts in engine room, receivers, lubricators and oiling devices, shafting, clutches, cranes, hoists and other engine room appliances, condensers and piping and steam fittings in engine room, separators, etc., and all things used in converting steam or water power into electrical energy, except electric plant, as enumerated below." Electric plant—"Cost of materials used and labor expended in repairing and renewing all electric equipment within the power house (not including the method of transmission of power beyond the power house), including generators and generator parts, dynamos, switchboards, cables and feeder terminals and wiring in connection therewith; storage batteries, transformers, boosters, rheostats, circuit-breakers, meters and other equipments."

Transportation Expenses.—Group I—Power. Account No. 73, "wages of power generating plant employes," includes in the government classification: "Pay of employes engaged in operating electric power generating stations, including engine rooms, boiler houses, dynamo or power houses, etc., such as engineers, firemen, electricians, dynamo men, oilers, cleaners,

coal passers and other employes, except those engaged in making repairs and renewals." This account should be divided into two accounts, as follows: Boiler house—"Pay of employes engaged in operating boiler houses, such as firemen, cleaners, coal passers and other boiler house employes, and part of chief engineer's salary, or of such others as may exercise immediate joint supervision over boiler and engine plant." Engine room—"Pay of all employes engaged in operating boiler room, such as shift engineers, electricians, dynamo men, oilers and other engine room employes, and part of the chief engineer's salary, or of such others as may exercise immediate joint supervision over boiler and engine plant."

The following accounts should also be divided between engine room and boiler house: No. 76, Lubricants for power generating plants—"Cost of lubricants, oil, waste, grease, etc., used on engines, shafting, dynamos and pumps." No. 77, Other supplies and expenses of power generating plants—"Cost of carbon brushes, fuses, lamps and other supplies, heat, light and other expenses not elsewhere specified."

With these changes it would be easy to find the total boiler house expense, by combining the items concerning it, under accounts Nos. 60, 73, 74, 75, 76 and 77.

WILLIAM R. GAITHER,
Assistant Treasurer and Auditor South Chicago City Railway.
Chicago, Ill., March 20, 1908.

ELIMINATE THE WORD FRANCHISE.

To the Editors:

Replying to your favor I would state that in my judgment any policy which would in effect eliminate the word "franchise" from our municipal lexicons would be a wise policy for everybody concerned.

Massachusetts, with seeming wisdom, has met this question with indeterminate franchises. A similar policy might be pursued in other states with similarly good results, though it must be remembered that the governments of Massachusetts are studious and unemotional. Massachusetts began a scientific study of the questions involved upon the first introduction of electricity as a new element of progress by appointing a commission of its ablest citizens to study the subject and report upon it. The report of this commission was made the basis of procedure in that state.

The pioneers and promoters of electric railway lines entered upon their work in that state as in other parts of the country enthusiastically, hopeful of vast profits. Their glowing prospectuses fell not only into the hands of investors, bringing about the outlay of much capital, but at the same time fell into the hands of the general public. And it came to be believed that inordinate profits were to be reaped to the disadvantage of the people. Both investors and the general public have been fooled. Investors are counting themselves lucky if they receive a small rate of interest upon their actual capital. Many have not been fortunate enough to get even that much. But the public still clings to the belief that millions of profits are being reaped. That fact gives the office-seeker his advantage. By telling the people how they are abused under their franchises the politician, without knowing or caring anything about the real conditions, erects himself into control of the government, and the power of the government, revolving around the word "franchise," is then used in ways which threaten to put the electric railway out of business.

In the state of Michigan—and I presume this fact applies to other states—no study of the subject has ever been made by the government through any commission appointed by the state legislature or by the administrators of any municipality. In fact, the whole state is in dense ignorance of the entire subject because it has not been systematically studied and reported upon by government authority, while whatever is said about it by those directly concerned in the management of such properties is disbelieved as being prompted by selfish motives.

Whether under these conditions indeterminate franchises would be an improvement is questionable, but indeterminate franchises could not at least be worse than periodic franchises as they are now treated by municipal governments.

J. C. HUTCHINS,
President Detroit United Railway.
Detroit, Mich., March 23, 1908.

CLASSIFICATION—A NEW METHOD FOR DETERMINING WHAT IS A SMALL COMPANY.

To the Editors:

Circular No. 20, submitted by the interstate commerce commission for criticism and suggestions upon the tentative classification for electric railways, contains two classifications, one for companies having a gross annual revenue of less than $50,000, with 22 accounts, and a classification for companies having a gross annual revenue of $50,000 or over, containing 116 accounts.

The classification submitted for the smaller companies commends itself by its simplicity and could be enlarged and improved by adding to Group "1" the following accounts: "Wages for power plant employes," "fuel for generating power plant" and "other expenses and supplies." These additions could be made without destroying the simplicity of the classification or adding to the expense of keeping it, and they would show figures which a manager would want to have at hand.

The line drawn by the interstate commerce commission, $50,000, as the limit between a small and a large company, is too low, and if it insists on taking the gross annual revenue as a basis for classifying the companies it should increase the figures to at least $300,000. A company the revenue of which had been under $300,000, that had been keeping 22 accounts, would be caused unnecessary expense if obliged to adopt the classification containing 116 accounts for large companies because its revenue had reached $300,000, when the simpler classification would still answer all the requirements of the managers and stockholders.

It is a hard nut to crack to name a figure as a limit between a large and a small company and have it satisfactory to all, and I do not believe that the amount of revenue should be the controlling factor in classifying the companies. I believe a better and more satisfactory way would be to classify companies according to the number of cars operated daily, and to have it optional with the companies to keep their accounts according to the classification of accounts for the class in which they were rated or the classification provided for any of the higher classes, the managers of the companies to decide which classification was best for its needs. For instance, the companies could be divided as follows:

A. Companies that operate 501 cars and upward.
B. Companies that operate 301 to 500 cars inclusive.
C. Companies that operate 101 to 300 cars inclusive.
D. Companies that operate 1 to 100 cars inclusive.

Companies in class D operating 100 cars or less daily should be privileged to keep accounts according to the classifications for classes D, C, B or A.

Companies in class C operating 101 cars to 300 cars daily should have the privilege of keeping accounts according to the classifications for classes C, B or A.

Companies in class B operating 301 cars to 500 cars daily should have the privilege of keeping accounts according to the classifications for classes B or A.

This would necessitate four classifications. There would be no objection to four classifications on the part of the railway companies and I hope there will be none on the part of the interstate commerce commission, as it is a long step from the classification for small companies to the classification for large companies as submitted by the commission.

To classify or rate the companies according to the number of cars operated is to my mind a better way than to classify or rate them according to the amount of revenue received. A company's revenue could increase without the company being obliged to increase the number of cars operated or to employ any additional labor, as all companies could handle more passengers with the number of cars operated than they now do.

If a company is obliged to increase the number of cars operated on account of traffic increases beyond the limit of its present carrying capacity it may be obliged to increase the mechanical force and car house employes to look after the additional equipment, and to add trackmen and linemen on account of the additional wear on roadway, track and line, and its needs may call for a more refined system of accounting.

VICE-PRESIDENT.

March 23, 1908.

CLASSIFICATION—THE LINE BETWEEN LARGE AND SMALL ROADS.

To the Editors:

Referring to the tentative classification of operating expenses submitted by the interstate commerce commission, I fail to see the benefits to be derived by requiring a road the receipts of which exceed $50,000 to use 116 accounts. In fact, from actual experience, I would say that it is not practical.

The gross receipts of the property which I represent are a little over $300,000 per year, with operating expenses of $139,000. I have used the standard classification with 38 accounts and find that it gives us all the information necessary. I, of course, subdivide a number of these accounts to give us certain information, for example, the cost of rails, ties, etc., in the maintenance of track and roadway account, and various others that I might mention; but to be compelled to use 116 accounts with this property would entail additional expnse not in any way commensurate with the benefits received.

To my mind there are two results to be obtained from a classification of operating expenses and from maintenance accounts: First, a distribution of expenses for the purpose of arriving at the cost of the various departments of the service for your own information. The present classification, with its flexibility, fully provides for this. Second, for the purpose of comparison with other properties. The present classification with its 38 accounts, or the tentative one submitted at Atlantic City with 51 accounts, would surely provide a comparison of the principal accounts upon which all estimates or statistics are based. When you subdivide beyond this you get into detail which, while it may be of advantage to yourself, does not enter into the object of comparison with other properties. Do not understand that I do not favor subdividing these main accounts, but the number of subdivisions to be used should be determined by the conditions governing each separate property.

W. B. Brockway, in his recent article in the Street Railway Journal, covers the situation as it relates to "small" roads, and describes a property almost identical with the one with which I am connected. I would say, however, that his limit of $200,000 for a "small" road is not large enough. I would raise that to between $300,000 and $400,000.

As secretary-auditor of this company I have but one man in the office eight months in the year, and two men four months in the year. I handle all the accounts, investigate and adjust all claims and do the buying. We consider that we have an up-to-date road in all respects, but I fear that with the use of a classification with which I would have to make 116 subdivisions we would add a considerable sum to the expense and not accomplish any beneficial results.

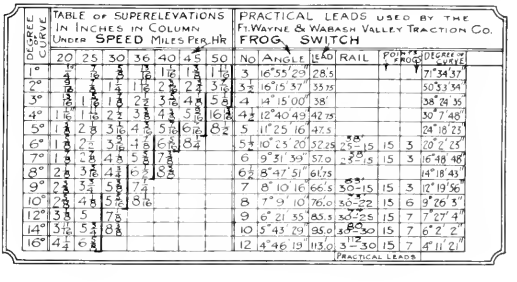
The adoption or change of any classification is of great importance, and as our present one is the result of careful and conscientious thought by the committee which prepared it, with a great deal of work, I feel that the question should be fully discussed by all interested.

G. B. CADE,
Secretary-Auditor Atlantic Coast Electric Railway.
Asbury Park, N. J., March 19, 1908.

THE RAILWAY BLUE BOOK.

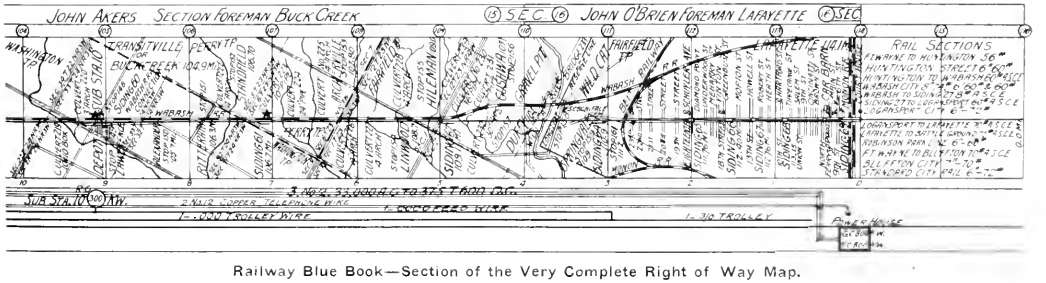
To the Editors:

If the result of your kind editorial in reference to the blue book which has been issued by our engineering depart-



Railway Blue Book—A Page for the Track Men.

ment under the supervision of our chief engineer, H. L. Weber, is an index of the value of your paper as an advertising medium, we can certainly recommend the same highly,



Railway Blue Book—Section of the Very Complete Right of Way Map.

for we have received requests from roads from the Atlantic to the Pacific almost, requesting copies of this book.

This book, as you know, is merely a blue print, and the preparation in a great quantity is quite troublesome to an engineering office with a limited force. Therefore we would suggest, if you could do so, your printing merely a part of the diagrams, to show the general character of the work to those who desire the information. The details of our own track and property conditions would not be interest-

ing to persons on other properties.

You have gotten us into this difficulty by your popularity among your readers, and we will look to you to help us out.

C. D. EMMONS,

General Manager Ft. Wayne & Wabash Valley Traction Company.

Ft. Wayne, Ind., March 23, 1908.

[We are willing to help Mr. Emmons out of the difficulty in which we seem to have placed him by our editorial comment on a railway "blue book," as published in the Electric Railway Review for March 14, 1908, page 318. Therefore we reproduce herewith one page showing the tables of superelevation of curved track, etc., and a small part of the very complete route map of which the larger portion of the book is comprised. These specimens amply show the character of this ingeniously made blue book and will serve to illustrate its value as a means of reference for the various heads of departments.—Eds.]

RESOLUTIONS OF NEW YORK STATE ASSOCIATION CONCERNING TENTATIVE CLASSIFICATION.

The following resolutions in relation to the tentative classification of operating expenses were passed at the meeting of the Street Railway Association of the State of New York at Albany, on March 18:

Whereas, At the request of the public service commission of the second district of the state of New York the Street Railway Association of the State of New York, by its representatives, met in Albany in October last with representatives of the commission, to consider a classification of accounts for street and interurban railways, to be adopted by said public service commission; and

Whereas, At a subsequent meeting a classification of accounts was presented which in substance agreed with that which had been adopted after a great deal of study by the American Street and Interurban Railway Accountants' Association, which classification embodies the best practical modern thought of street and interurban railway accounting; and

Whereas, It was then suggested on behalf of the public service commission that the system of accounts for the second district of the state of New York would be adopted substantially to conform with any system of accounts which might be prescribed by the interstate commerce commission, and it was further suggested that inasmuch as representatives of the interstate commerce commission were then engaged in preparing a classification of accounts for electric railways engaged in interstate commerce, that it would be possible for representatives of this association to meet with representatives of the interstate commerce commission and the American Street and Interurban Railway Association and various railroad commissions, with a view to agreeing upon a classification of accounts; and

Whereas, In pursuance of such suggestion, representatives of this association did meet with representatives of the interstate commerce commission in Washington for a discussion of the standard system of accounting to be adopted by the electric railways, which discussion did take place; and

Whereas, At such meeting the classification of accounts which had been adopted by the American Street and Interurban Railway Accountants' Association with modifications was presented as the views of the American Street and Interurban Railway Association and the Street Railway Association of the State of New York as the best classification of accounts for electric railways, copy of which is herewith attached and made a part of this resolution [This classification was published in the Electric Railway Review of December 21, 1907, page 956.—Eds.]; and

Whereas, The classification so presented did not meet with the approval of the representatives of the interstate commerce commission, who took the position that not only should there be a standard system of accounting for all transportation agencies, but also that the method of accounting for electric railways should conform to methods heretofore adopted for steam railways; and

Whereas, The representatives of the interstate commerce commission have prepared subsequently a tentative classification of operating expenses of electric railways and a tentative classification of expenditures for road and equipment of electric railways and text therefor, which have been carefully examined by members of this association and have been found to embody the theory and practice of and are conformable to the classification of accounts for steam roads; and

Whereas, The members of this association believe that this view is erroneous and that its adoption and promulgation by the public service commission of the second district of the state of New York, to whose jurisdiction alone the majority of the members of this association are subject, would result in great inconvenience and hardship, both to such companies and to their security-holders; now therefore, be it

Resolved, That in order to prevent a serious injustice which in the opinion of this association would result to its members and their security-holders from the adoption by the public service commission of any such plan of classification of accounts as has been proposed by representatives of the interstate commerce commission, the president of this association appoint a committee of six members, whose duties shall be to make a detailed report of the objections to the tentative classifications proposed by the statistician of the interstate commerce commission, and to prepare and present a brief showing the actual conditions and probable results to the electric railways subject to the control of the public service commission of the second district of the state of New York from an adoption by it of the proposed system of classification of accounts; and said committee is further authorized to perform any such acts which in its judgment will be necessary and proper to secure the adoption of the classification of accounts as shown on the plan hereto annexed. [Referred to in the foregoing.—Eds.]

Resolved, That in the judgment of this association the mandatory establishment of any depreciation accounts is, in the present state of the electric railway development, and under existing financial and industrial conditions, unwise and unnecessary and would impose a serious burden and hardship upon existing electric railway properties and their security-holders, and the committee appointed under this resolution is directed to make all proper efforts to prevent the establishment of any depreciation accounts chargeable to either operation or maintenance, and to secure the establishment of a permissive depreciation account to be treated as a deduction from income, as may be from time to time recommended by said public service commission.

Resolved, That said committee be instructed to request a hearing before the public service commissioners of the second district of the state of New York for the purpose of enabling this association to be heard upon the questions involved.

The names of the members of the committee to which the resolution refers were published in last week's issue, page 350. The meeting of this committee, which was to have been held on March 23, has been postponed until March 30, to be held in the office of C. Loomis Allen, vice-president of the Utica & Mohawk Valley Railway, at Syracuse, N. Y.

Electric Shocks.

D. S. Arnold of Purdue University delivered an address on "Electric Shocks at Different Potentials" at a meeting of the Purdue branch of the American Institute of Electrical Engineers, held on March 17, 1908, at Purdue University, Lafayette, Ind. The speaker first dwelt upon the action of electricity on the body producing death. One investigator had advanced the theory that the action of the shock on the nerves caused contraction of the capillary blood vessels and in this way stopped the heart, since there was no circuit of the blood. Another theory advanced was that death is due to electrolytic action of the current in the blood. If this is true direct currents must be considered more dangerous than alternating currents. In the investigation of the effect of electric shocks a number of things were considered, the first being the susceptibility of different persons. People differ in this respect and the susceptibility of the same person may vary at different times. Certain diseases also have an effect on the susceptibility to shock and a number of cases are recorded where persons of weak mind were affected very little by shocks. Again, the physiological condition of a person may change the effect of the shock. The path of the current through the body is given very little consideration by doctors, but the nature of the contact made with the electric circuit has much to do with the effect. The resistance of a man holding two copper pennies, to which were soldered wires, was found to be 20,000 ohms less than when he held the bare wires. The resistance of a man from thumb to thumb varies from 30,000 to 100,000 ohms. It was found that the burning increased when the area of contact was small. To sum up, it may be said that a current of less than 30 to 35 milli-amperes is not fatal, and as the resistance of the body is 30,000 ohms, at the lowest a voltage of from 100 to 110 is necessary to kill. Usually, however, the resistance of an accidental contact is much higher, so that shocks at higher voltages are received without fatal results. The burning varies inversely as the area of contact and severe burns usually indicate poor contact.

CENTRAL ELECTRIC RAILWAY AND TRAFFIC ASSOCIATIONS.

The meeting of the Central Electric Railway Association was called to order by the president, F. D. Carpenter, general manager Western Ohio Railway, at 10 a. m. on Thursday of this week at the Claypool hotel, Indianapolis. There were 75 present.

Chairman of Traffic Association.

W. S. Whitney, general passenger and freight agent Ohio Electric Railway, presented the report of the committee appointed at the meeting of the Central Electric Traffic Association in January to further the selection of a chairman for that organization, recommending A. L. Neereamer, formerly general superintendent Columbus Delaware & Marion Railway. The report states that this committee met with the committee of the Central Electric Railway Association on March 25 to effect a permanent organization and to select a chairman, who should also be elected permanent secretary of the Central Electric Railway Association. "After listening to various applications made in person," the report continues, "it was the unanimous opinion of the committee that A. L. Neereamer was the most competent of the various applicants."

It was estimated that $7,000 would be necessary to defray the expenses of salary, traveling expenses, office expenses, etc., for 1908, and that each road within the territory covered by the association should be taxed pro rata according to its mileage, with a minimum of $2.50 per month. Statements covering the expense will be forwarded to the various member roads each month, payment to be made in advance.

The election of Mr. Neereamer to these two offices was therefore announced. W. F. Milholland continues as treasurer of the association.

Uniform Rules.

Mr. Carpenter called attention to the work of the committees which are drafting uniform rules for operation of trains and maintenance of way in Indiana. The rules submitted by these committees are to be recommended for adoption by the Indiana railroad commission. Mr. Carpenter thought it would be desirable to have uniformity of rules in Ohio and Indiana. As the Indiana committee on rules for train operation had practically adopted the Central Electric Railway Association rules as a foundation he thought that a committee should be appointed to take up the subject on behalf of the Ohio roads. The rules should be known as revised Central Electric Railway Association rules or the association would lose the credit for the work it had done.

H. A. Nicholl, general manager Indiana Union Traction Company, said that he believed the association would have the credit of furnishing the basis for the rules in Indiana and that the members of the committees felt that the book adopted in Indiana would be satisfactory to Ohio railway officials.

Alexander Shane, chief inspector of the Indiana railroad commission, was asked to speak regarding the work of the committees, which has been practically completed. He said that if there was anything needed to promote economical and safe operation it was the frequent exchange of ideas which an association permitted. The practical men who had attained positions of responsibility in the past had secured their education at the cost of thousands of dollars to the railway companies, but the day was fast passing when the railways would educate their men. The men would have to be educated before they could get responsible positions. The Indiana commission did not intend in any way to presume to operate the railways. If the commission considered the rules safe it would approve them. Uniform rules would make it easier for employes to work on different roads than if there were a different system on each line.

President Carpenter, following the offering of a resolution, announced that he would appoint a committee of Ohio officials at the afternoon session to act with the Indiana committees.

C. D. Emmons, general manager Ft. Wayne & Wabash Valley Traction Company, brought up the subject of the Central Electric mileage book. So many notices had been given of withdrawal of the use of this book that there were now very few companies still using it. Individual books introduced by separate roads had very largely taken the place of the Central Electric mileage book. If the book was to be used still it should be reconstructed.

On motion of Mr. Emmons the president was directed to appoint a committee to ascertain how many companies desire to use the book and to make a full report recommending the continuance or the abolition of the book. Mr. Carpenter said that he would announce the committee at the afternoon session.

E. C. Carpenter, claim agent Indiana Union Traction Company, spoke of the effectiveness of index bureaus in locating dishonest claimants, and on his motion the president was authorized to appoint a committee of three to devise a plan whereby information regarding dishonest claimants of whom the members of the association have knowledge can be exchanged.

Classification of Operating Expenses.

Strathearn Hendrie, general manager Grand Rapids Holland & Chicago Railway, urged that action be taken concerning the classification of operating expenses. The Central Electric Association more truly represented the roads in the middle west than the Street Railway Association of the State of New York or the American Street and Interurban Railway Association, which had taken action regarding the classification.

On the motion of Walter Shroyer, auditor Indiana Union Traction Company, the following resolutions were passed:

Whereas, By reason of the revolutionary character and the intricacy of the system of electric railway accounts promulgated by the division of statistics and accounts of the interstate commerce commission under Circular No. 20, Accounting Series, time beyond the date fixed by the division, namely, March 28, 1908, for the receipt of replies to the circular, is essential to well-considered action which will be of value to the interstate commerce commission and just to the electric railroad interests.

Resolved, therefore, That it is the sense of the Central Electric Railway Association that an extension of time for the making of replies to such circulars be granted to and including April 30, 1908, and that the president and secretary of the association are authorized and instructed to communicate a copy of this resolution to Henry C. Adams, in charge of such division, and to take any further action necessary to secure the desired extension.

Arthur W. Brady, president Indiana Union Traction Company, discussed the classification. An abstract of the remarks of Mr. Brady follows:

Additional time for answers to Circular No. 20 ought to be secured. While the circular is dated in January copies of it were not received until about March 1. The companies have had a very short time to consider such an involved system. The accountants of the companies are of the opinion that the system is altogether too complicated for use by companies generally. Plenty of time should be granted by the commission, so that companies may analyze the system and prepare the objections which should be made. While the interstate commerce commission does not desire to embarrass the companies, the system will add considerably to the expense of operation and will not result in giving any information of especial value to the commission. Objections are raised to the classifications, not because there are 116 primary accounts, but on account of the number of indefinite items concerning which information is asked. Some of the information can be furnished only by guesswork and the guesses will vary with the men who make them. When the current expense and power expense in shops are divided analyses will have to be made which will not be possible without exorbitant cost. Unless such divisions are made with extreme care at heavy expense they could be of no value. The circular of the commission should be analyzed as closely as possible and all objections which are entertained should be included in the reply to the commission.

Adam Cole, Vaile & Kimes Company, Dayton, O., then read his paper on "Standardization of Trolley Wheel, Harp and Pole." This paper appears elsewhere in this issue.

G. H. Kelsay, superintendent power Indiana Union Traction Company, had seen stems with grooves cut in the base from the swiveling of the trolley. The current passing through had burned out the oil between the two surfaces. To overcome this difficulty he had used a flexible bond between the base and the stand to shunt the current around the joint. He had seen roller bearing stands tried, but the rollers were reduced to one-third their size after service, due to arcing. He had had little or no trouble with other parts of the trolley.

Committees.

At the afternoon session President Carpenter announced the members of the three committees whose appointment was authorized at the morning session, as follows:

"Claims"—E. C. Carpenter, Indiana Union Traction Company; Walter G. Robinson, Ohio Electric Railway; F. R. Fahlsing, Ft. Wayne & Wabash Valley Traction Company; Charles A. Floyd, Grand Rapids Holland & Chicago Railway; A. L. Neereamer, secretary.

"Mileage Book"—F. D. Norviel, Indiana Union Traction Company; W. S. Whitney, Ohio Electric Railway; F. W. Brown, Michigan United Railways.

"Rules"—F. J. J. Sloat, Ohio Electric Railway; C. N. Wilcoxon, Cleveland Southwestern & Columbus Railway; F. W. Coen, Lake Shore Electric Railway.

H. D. Murdock, master mechanic and electrical engineer Indianapolis & Louisville Traction Company, read his paper on the 1,200-volt direct-current system of that company. This paper appears elsewhere.

A. C. Vanclain of the Baldwin Locomotive Works read his paper on "Electric Motor and Trailer Trucks," which was illustrated with stereopticon views. W. P. Deppe then read a paper. These papers appear elsewhere.

The following were admitted to membership: Charles A. Floyd, general passenger and freight agent Grand Rapids Holland & Chicago Railway; George MacLeod, superintendent of railways Lexington & Interurban Railways; C. P. Leibold, Ohio Brass Company; G. M. Patterson, general freight and passenger agent Toledo & Chicago Interurban Railway; W. S. Whitney, general passenger and freight agent Ohio Electric Railway; Carl H. Peterson, Baldwin Locomotive Works and Standard Steel Works; A. M. Hewes, general manager Indianapolis Crawfordsville & Western Traction Company.

The next regular meeting will be held at Cleveland.

After adjournment a number of members accepted the invitation of A. A. Anderson, general manager Indianapolis & Louisville Traction Company, to make a trip over the road. A special car left Indianapolis at 5 p. m. for the accommodation of those who made the trip.

Mr. Neereamer's Valuable Experience.

Mr. Neereamer, the new chairman of the Central Electric Traffic Association and secretary of the Central Electric Railway Association, has had a valuable experience with both steam and electric railways. He was in the accounting department of the Hocking Valley Railway from 1883 to 1889. During the ensuing four years he was in the general passenger office of the Cleveland & Marietta road at Mansfield, O. From 1893 to 1903 Mr. Neereamer was with the Columbus Sandusky & Hocking road at Columbus. In that time he filled successively the positions of chief clerk in the general passenger office, traveling passenger agent and chief clerk in the general freight and passenger department. In 1903 Mr. Neereamer became general agent at Columbus for the Columbus Delaware & Marion Railway, and during 1904 he was made general passenger and freight agent and then traffic manager. Mr. Neereamer was made general superintendent in 1906 and resigned on January 15, 1908. During the time he was with the Columbus Sandusky & Hocking road Mr. Neereamer was secretary for eight years of the Columbus passenger committee.

TWELVE HUNDRED-VOLT SYSTEM OF THE INDIANAPOLIS & LOUISVILLE TRACTION COMPANY.*

BY H. D. MURDOCK, MASTER MECHANIC AND ELECTRICAL ENGINEER.

Ever since the introduction of electric traction for interurban service the economical transmission of electric power to the moving car at a voltage that could be successfully used by the motors has been a great problem.

In the earlier institutions the booster system was used—but this at its best was not very economical—no real progress was made until the development of the rotary converter with high-tension alternating-current transmission, but this system, while capable of covering a large territory from a single power station, requires substations at frequent intervals, equipped with costly machinery needing constant attention to transform the high-voltage alternating current to the low-voltage direct current required at the motors.

To overcome these objections the single-phase railway system has been developed, using very high voltage on the trolley wire and a reducing transformer on the car. This in the abstract is ideal, but up to date the alternating-current motor has "refused" to be as good a motor as the direct-current one and for that reason the direct-current motor is still a favorite.

A remarkable development in the direct-current railway motor has recently taken place—the application of the commutating pole principle has already doubled the usual voltage and the end is not yet. This improvement in voltage capacity is a great advance in the art. The fact is noted that the voltage of railway motors has been raised only 150 volts in 20 years.

This type of motor was first used in this country with 1,200 volts on the trolley wire in the equipment of the Indianapolis & Louisville Traction Company system. It may be of interest to note how free from complication the entire system is from the power house to the car equipment.

The section of road operated at 1,200 volts is 41 miles in length, connecting with the Indianapolis Columbus & Southern Traction Company at Seymour and the Louisville & Northern Traction Company at Sellersburg, with an operating agreement with the above roads for through service from Louisville to Indianapolis without change of cars. [The equipment of the new road was described and illustrated in the Electric Railway Review for November 30, 1907, page 852.—Eds.]

The feeder system consists of two sections, extending 17 miles each way from the power house; in each section the copper is distributed as follows: Five miles, 500,000 circular-mils; 10 miles, 300,000 circular-mils; 2 miles, No. 0000. The balance of each 20-mile section is fed only by the trolley wire. The trolley is tapped to feed every 1,000 feet. The line is protected by Garton lightning arresters, designed for 1,200 volts, which are installed every 1,000 feet.

The car equipment consists of eight passenger and two express cars. The passenger cars are of the combination type arranged for single end operation and are 50 feet 4 inches in length, mounted on Baldwin trucks with rolled steel wheels 34 inches in diameter. Each car is equipped with four General Electric type 205 motors, which are commutating pole units rated at 75 horsepower and insulated for 1,200 volts; the windings of the commutating poles are connected in series with the armature. The current in the exciting fields is reversed to change the direction of rotation of the armature.

For 1,200-volt operation the two motors on each set of trucks are connected in series and each group in parallel in the free running position. On 600 volts the usual series-parallel connections are used. To make this change in grouping a commutating switch is used which is located next to the master controller in the motorman's cab.

The General Electric type M multiple-unit control system is used with a C-35A master controller which combines automatic acceleration with multiple-unit operation. A motor cut-out switch is installed on each car and is designed to cut out a pair of motors when operating on either 600 or 1,200 volts. The contacts are arranged to prevent the control system being operated beyond the series position on 1,200 volts.

As this equipment is designed to operate at 600 as well as 1,200 volts the lights, air compressor and control circuits are operated at 600 volts to use standard apparatus and insure greater safety. To obtain 600 volts for this purpose when the car is being operated at 1,200 volts a motor generator or dynamotor is used. This is the most important piece of special apparatus in the car equipment, as the operation of the entire equipment depends absolutely upon its uninterrupted operation. The dynamotor is controlled by an automatic switch or contactor, which will operate only on a voltage

*Abstract of paper read before the Central Electric Railway Association at Indianapolis, Ind., March 26, 1908.

somewhat in excess of 600 volts. This switch is provided with a contact so arranged that when the switch is open on the dynamotor it connects the auxiliary apparatus to the 600 volts from the trolley when the car is being operated at this voltage.

To facilitate changing from 600 to 1,200 volts, or vice versa, a 50-foot dead section in the trolley wire is built at each end of the 1,200-volt line. On a car coming from 1,200 to 600 volts the following changes take place. The automatic dynamotor switch drops out, the motorman throws the commutating switch to the 600-volt position and as soon as the car is on the 600-volt section an automatic 3-point switch is thrown to the normal 600-volt position, the entire change being made in less than five seconds.

The car wiring is all run in iron conduit and all wire used is heavily insulated. So far no trouble has been caused by the 1,200 volts on any of the apparatus or wires carrying this voltage. The commutation of the motors is exceptionally good. The wear of the commutators and brushes is almost imperceptible. So far as the wear of the brushes is concerned the indications are that a set will run a million miles. Since the equipment was placed in operation last October it has run more than 260,000 car-miles, 200,000 on 1,200 volts and 60,000 on 600 volts, and has operated equally well on either.

Every system has its advantages and disadvantages and the 1,200-volt system is no exception to the rule. As compared with 600 volts it requires less copper in the feeder system, a less number of power houses or substations and a smaller power carrying capacity in the trolley wheel, which is quite an important feature. The 600-volt system has the advantage in the less cost in the car equipment as compared with the single-phase system. The motors are more efficient, weigh less, have better commutation and there is less complication in car control. The single-phase system has the advantage in the feeder system and substation equipment, but the application of 1,200 volts direct current to electric traction has placed in the hands of the electrical engineer another system to select from, which should enable him to solve some of the perplexing problems in electric traction, more economically than heretofore.

POSSIBILITIES OF ELECTRIC RAILWAYS.*

BY W. P. DEPPE, VICE-PRESIDENT AND GENERAL MANAGER MABOU & GULF COAL COMPANY, LTD., CAPE BRETON, N. S.

There are two ways to make increased profits on any railway, either by increasing the traffic with a ratio of increase in operating expense less than the increased ratio of traffic or by carrying a given amount of traffic at greatly reduced operating cost.

It is axiomatic in the transportation world, in the more densely populated sections at least, that business always increases faster than the facilities. There is a possible limit for each existing electric line in expansion of local travel within a city, to resorts, etc., although there seems to be a continual increase where the management is watchful and caters to any new fad, shift of population or new attraction.

First of all it is absolutely necessary that the various lines in your territory should adopt standard tracks, cars and equipment of all kinds in all departments. This applies to interurban lines as well as city lines, because both are seriously handicapped if interurban lines find radical differences in equipment, voltage, etc., at every city.

It should be possible in the near future for any electric car to run from one end of the territory to another if a motor car with a very limited amount of changes in current requirements. On a standard gauge, however, for all lines, through express, freight and passenger cars can be operated as trailers, and it is not necessary to confine through cars to motor cars. Trailers are not half so dangerous as generally thought, where proper precautions against accidents are taken in advance.

Through cars as trailers can carry light freight, express, mail and passengers and there is a fine opportunity in this territory to establish a parcels express on a blanket rate for each state, with proper rate for interstate business. The express business of the steam lines in your territory amounts to $6,500,000 annually, and the mail to $8,300,000, and there is no reason why you should not have a fairly good part of that traffic. There are a great many details to overcome, but there is no good reason why all cannot be overcome. Heavy freight business requiring quick and prompt movement can be secured as lines become standardized and through car lines established.

In summer months and in some cases in winter large organized parties gotten up through societies of various kinds can be worked up for circle tours, where the total rates include hotel, side trip and other expenses. This business has paid the steam lines well where they have properly organized for handling such business.

Proper effort should be made to establish full interchange with the steam roads, in a limited way at first perhaps. This will enable electric lines to strive for the location of large industries on their roads. It has been my observation during my connection with the steam lines that, with a few possible exceptions, the electric lines have not handled their negotiations with steam lines in a way that will ever bring about the friendship and exchange of traffic with steam lines until such time as the steam roads feel obliged to absorb the electric lines, as has been done in other sections, where the electric lines have been simple feeders for the steam lines.

It is quite possible to hasten interchange with the steam lines under certain conditions by legislation. The lake lines and coast lines have forced recognition by all the steam lines, although it took some time to do it, and in most cases they are now directly allied with the several steam systems.

It is also possible in many of the larger cities where electric lines are of steam railway standard gauge to readily arrange to do a switching business of freight between the terminals of the steam lines and warehouses of merchants and manufacturers.

Standardization of gauge, cars, equipment of all kinds, etc., means less complications mechanically and electrically. If this work is not pressed now it will but put off the day of reckoning and each year's delay to bring it about will only add to the expense when finally it is done.

It is likely that standardization will have a tendency to bring about consolidation of lines, but the fact is that the best results for some time to come will more likely accrue to the various electric lines if they remain in control of men who built up the lines into systems along natural traffic routes, thus giving personal direction to increase of business and profit, which does not as a rule occur in a large system in so thorough a manner because of rigid rules in management applying over a widely varying territory, to the detriment of peculiar local conditions which require careful nursing in the transformation stage of the development of a new industry and which are throttled when consolidation comes before these possibilites are developed.

One of the greatest causes contributing to the hatred shown by the people and legislative bodies today against steam lines lies in the fact that much injustice in detail does exist on large systems, for the reason that ranking officers on the large systems fear to alter rules and make exceptions. This should be carefully guarded against in electric line management as the properties develop and consolidation ensues.

It seems to me that all labor questions should be handled through your association in cases where your employes call in their state or national officers. The managing officers could stay in the background, although dictating the association's action. In the past the steam railways have been at a disadvantage with labor unions for the reason that the men have one single policy expressed through one head as a rule, while the railways as systems or territories consider their local conditions first. This has practically taken the discipline of the steam lines out of the hands of the roads' officers and put it into the labor union leaders' power to dictate.

In advertising certain standards can be worked out, distribution properly attended to, and good results obtained for less money, through some central agency where interurban business is involved.

The largest item of expense next to installation and wages of car men is probably the cost of producing power. While there is a tendency on the part of new lines to use existing power houses by purchasing power from established lines, the time is approaching when the lines in this association should get together in a more comprehensive power house plan. A large power house located in one of the coal fields in Ohio, in Indiana and in one of the fields in Illinois, cutting out the freight charges on coal, as well as the mining companies' profit, cost of the handling now incurred, using the largest turbine units, with main distributing lines carrying high potential current, joining the three plants on the main distributing lines across Ohio, Indiana and Illinois, will produce current and deliver it in present distributing points for approximately one-half of the present power house costs on the average. It will also save the wages and incidental expenses of scores of plants now existing for railways, lighting, power, etc. I will venture the prediction that coal will increase in cost of production at the mines at the rate of five cents per ton per annum, because of increased wages, increased cost of plants for the protection of labor, taxes and the purchase and control by large coal companies of unopened

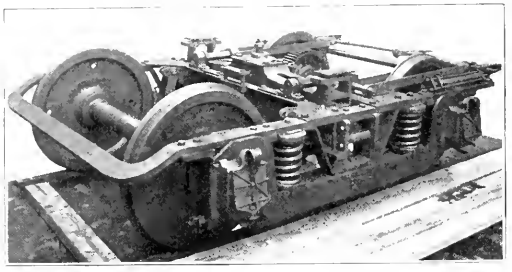
*Abstract of paper read before the Central Electric Railway Association at Indianapolis, Ind., March 26, 1908.

areas which are being capitalized and carrying fixed charges. The agreement of all your lines to take a certain amount of current at cost plus fixed charges in such a system of power houses would give a company sufficient credit to sell bonds for the purchase of mines, cost of power houses and transmission lines.

ELECTRIC MOTOR AND TRAILER TRUCKS.*

BY A. C. VAN CLAIN, BALDWIN LOCOMOTIVE WORKS.

The electric motor truck is in itself a locomotive and must be so considered in its design and construction. Purely car truck principles of design will not do. It must not only carry the weight put upon it by the car body and load, but must in addition successfully withstand the various strains produced



Electric Trucks—Figure 1—M. C. B. Equalized Type for 28,000-Pound Center Loading.

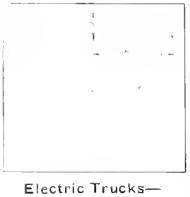
in it by the weight and torque of the motors, the severity of these strains being influenced by the number of motors per car or per train and their distribution. Heavy cars, great variations of loads, high speeds, high rates of acceleration and retardation, frequency of stops, irregularity of road profile, etc., augment the severity of its requirements.

Being the medium between car and roadbed, its design, workmanship and materials are important factors in the economical maintenance of both. The design of motor trucks is generally beset with the difficulty of certain restricted dimensions. With the development of higher speeds and heavier and larger cars, necessitating the use of more powerful motors and heavier trucks, the problems of motor truck design have grown more difficult.

Experience has shown that a rigid truck with springs properly designed and distributed is a better unit than a so-called electric truck. Figure 1 shows an electric motor truck of the M. C. B. equalized type, designed for a maximum center-pin load of 28,000 pounds and for Westinghouse 135-B motors, inside hung. The wheel base is 78 inches.

Wheel Base.

Usually the greatest difficulty with which the designer has to deal, when motors are inside hung, is a too restricted wheel base. For transoms, bolsters, bolster hangers, motor suspensions and clearances, there is only that space which is left by the motors, and sometimes so little is this that it becomes necessary to fall back on the purchaser for permission to increase the wheel base a few inches to enable the guarantee of a good job. Transom and bolster widths are important, not the least reason being that the riding qualities of the elliptic springs are impaired by restricted width. A generous wheel base not only simplifies the problems of design, but helps to keep down maintenance costs through lessened rail distortion and wheel flange wear. It is important to carefully analyze the smallest existing curve around which a truck is intended to operate, before determining upon its wheel base. The radius of an existing curve may be formed by laying off on the inside rail, by means of a tape measure, a chord of any desired length as shown by Figure 2.



Electric Trucks—Figure 2.

Measure the middle ordinate (a) in feet or fractions thereof and apply the following formula: $R = (a^2 + b^2) \div 2a$, in which R = radius of curve in feet, a = middle ordinate in feet, b = one-half the chord in feet.

Having found the radius of the curve, the greatest wheel base which will pass safely around it can be determined by the following formula, assuming M. C. B. standards in flanges and rails, no increase of gauge in curve and 31 to 40 inch diameter of wheels: $W = R \times 0.18$, in which W = wheel base in inches, R = radius of curve in inches.

Any spread in the curve will, of course, increase the permissible wheel base, as will also certain variations of flanges of wheels.

Now, while a sufficient wheel base is desirable, too great wheel base has its evils also. As will be explained later, the suspensions for inside hung motors should be located as near to the center of the truck as possible and with any given design and size of motor these suspensions must naturally be located farther from the center of the truck for every increase in wheel base.

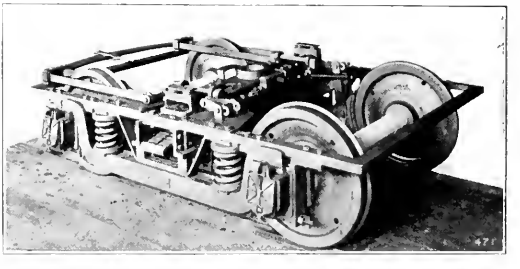
The final determination of the wheel base, therefore, should, if curves will permit, be based entirely upon a transom width sufficient to allow proper width of bolster and bolster springs and the fixed length of the motors measured from their axle journals to their supporting nose.

Frame.

The design of a frame depends necessarily upon the conditions to be dealt with. Figure 3 shows a design of frame for an M. C. B. equalized type of motor truck with inside hung motors. It is based upon many years of locomotive experience and is undoubtedly the best design of electric motor truck frame known. The proper distribution of metal can be provided for equally well in both solid and built-up frames, and if properly designed and constructed the built-up frame is as permanent and will stay together as well as the solid frame, with the added advantage that, built as it is from commercial shapes and sizes of materials, it can be repaired at a minimum cost in shops having only the ordinary repair shop facilities, while a solid frame cannot, if seriously damaged by collisions or other accidents. It is, of course, necessary that the workmanship put into it be of the proper quality, but this holds good with the solid frame as well, being a question of machine shop in one case and of smith shop or foundry in the other.

Properly proportioned and constructed it is practically impossible for this frame to get out of square in the hardest kind of service.

For outside hung motors this frame is necessarily modified generally as shown by Figure 4. The end frames are of angle iron bolted to the side frame extensions. The location of motors requires the equalizing springs to be placed outside the pedestals to give a longer spring base, which necessitates



Electric Trucks—Figure 3—Equalized Type of Truck for Inside Hung Motors.

a proportionately greater depth of section in the top members of the side frame, due to the overhang from the truss. The end braces also become necessary to support the end frames, which carry about 40 per cent of the dead weight of the motor. For trailer trucks the frames usually conform in general design to those of the motor trucks with which they are to be used.

Equalizers.

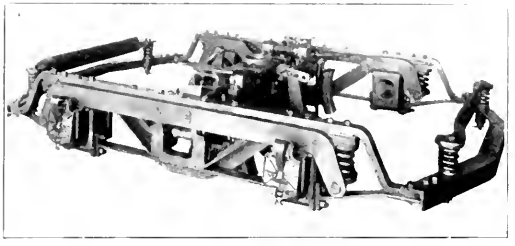
The chief advantages of the equalizers are a shorter truss in the side frame, a slightly added resiliency of the helical springs and diminution of frame height over the journal boxes which could be avoided otherwise only by a multiple of helical springs. The transfer of weight from one axle to another is entirely uninfluenced by them. Sometimes these equalizers are fastened rigidly to the journal boxes, but this is not good

*Abstract of paper read before the Central Electric Railway Association at Indianapolis, Ind., March 26, 1908.

practice. The object sought is a prevention of spread of wheel base during brake application, which means a loss of brake piston travel. In a high-grade electric truck the journal boxes are accurately machined inside and outside, as are also the pedestal legs, and the clearances are small. Therefore the spread of the wheel base during braking is small. When the journal boxes are thrown out of alignment with the faces of the pedestal legs the riding qualities of the truck will be affected.

Suspension of Motors.

It is customary to carry about 60 per cent of the dead motor weight upon the axles and the remaining 40 per cent upon the frame. The ordinary types of motor suspension are the nose and bar supported by the transoms, for inside hung motors, and the bar and knee supported by the end frames for outside hung motors. Helical springs are usually interposed



Electric Trucks—Figure 4—Truck for Outside Hung Motors.

between the motor nose and the suspension to minimize shocks, of starting and accelerating, relieving the helical truck springs of this particular function.

Upon the location of the motor suspensions with regard to the center of truck or of the axles, depends the amount of motor weight transferred through the frame from one axle to the other by the torque and the tendency of the motor to revolve upon the axle when brakes are applied. Let us assume a truck having a wheel base of 6 feet, carrying two motors inside hung, one upon each axle, and weighing 4,000 pounds each, of which 60 per cent is carried upon the axles and 40 per cent upon a suspension supported by the frame at a distance of one foot from the center of the truck. We know that frequently in starting the torque of the rear outside hung motor will lift its supporting nose free from the motor suspension. Let us assume that it does so in this case, then 1,600 pounds will be transferred from the rear motor suspension to the rear axle and a like amount will be transferred from the forward axle to the forward motor suspension. The total motor weight upon the frame will remain the same as it was before, but it will be differently distributed, and instead of 1,600 pounds supported each side of the transom at one foot from the center of the truck, we will have 3,200 pounds supported one side of the transom at one foot from the center of the truck and the frame will tilt in consequence.

Let us next assume a truck having a 6-foot wheel base also, and carrying the same motors as the previous truck, but having them outside hung with 40 per cent of the dead motor weight carried by suspensions supported on the end frames. In this case the transfer of motor weight will be from the rear axle to the rear motor suspension and from the forward motor suspension to the forward axle and, instead of 1,600 pounds of dead motor weight supported at each end of the frame, we will have 3,200 pounds supported at the rear end of the frame, and as this is supported outside of the spring base of the truck we will have a negative motor weight at the forward end of the spring base and a greater tendency of the frame to tilt than with the inside hung motors.

Tilting of the frame throws the pedestal legs out of vertical, impairing the riding qualities of the truck by reason of the added friction and shocks. Ordinarily, therefore, for inside hung motors the frame suspensions should be located as near as possible to the center of the truck and for outside hung motors as near to the center of the axle as possible.

Brakes and Braking.

In an ordinary 2-truck car which is not self-propelled the application of the brake results in a transfer of weight from the center plate of the rear truck to that of the forward truck, due to the brake pressure being exerted below the center of gravity of the car body and the consequent tendency of the car body to rotate about an axis at the center plate of the forward truck. In the same way, the brake pressure being exerted below the center of gravity of the truck, each truck tends to rotate about an axis at the point of contact of its forward wheels with the rails—the rear wheels of the rear truck then will carry less weight during the braking period than any of the other wheels.

In the electric car with motors supported partly by the wheels and partly by the truck frames the dead weight of the motors is an additional factor, affecting the transfer of weight from one axle of the truck to the other. When brakes are applied to the wheels of the trucks the motors tend to revolve upon the axles and with inside hung motors part of the weight of the forward motor is moved forward from the motor suspension to the axle and part of the weight of the rear motor is moved forward to the motor suspension, increasing the rotative tendency of the truck, while, with outside hung motors, partly supported by the end frames, part of the weight of forward motor will be moved backward from the motor suspension to the axle and part of the weight of the rear motor will be moved backward, from the axle to the motor suspension, decreasing the rotative tendency of the truck. With inside hung motors, therefore, the shifting of weight from the rear to the forward axles of a motor truck is greater than the shifting which occurs in an ordinary car truck. With outside hung motors the shifting is less. Wheel base also is a factor involved with weight during braking; these conditions being less important, of course, with a long wheel base than with a short one.

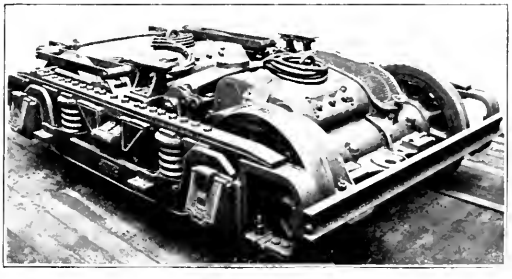
With inside hung brakes the difference in weight upon the two axles of the truck during the braking period can partly be compensated for. Referring to the rear truck, which will be carrying the lighter load, the live lever end of the truck is always forward and the live lever hanger links are in compression.

By a proper inclination of these hanger links a toggle joint is formed and an increase of brakeshoe pressure upon the forward wheel results. This cannot be done with outside hung brakes.

Outside hung brakes, while more "getatable" than inside hung, are less desirable. During the braking period the hanger links of inside hung brakes oppose the tilting tendency of the frame, while those of the outside hung augment it.

In the case of an ordinary passenger car, not self-propelled, it is customary to use a calculated braking power of from 90 to 98 per cent of the light weight of the car. For motor-driven cars the energy exerted by the rotation of the armatures is taken into consideration and a much higher percentage is used, sometimes as high as 115 per cent.

Flanged shoes were first introduced for the purpose of keeping the flange of the wheel ground down to compensate for the wear of the tread. As the motors of electric trucks



Electric Trucks—Figure 5—Motor Truck Design for 28,000-Pound Center Pin Loading.

usually prevent the use of brakebeams, these flanges are retained in electric truck practice as guides for keeping the shoes in line with the wheels. This is no doubt the simplest form of guide that could be devised for this purpose, but used without a brakebeam it contributes to the tendency of the brakes to chatter, making more careful manipulation of the brake necessary.

Chattering of brakes has given rise to various anti-chattering devices, some of them very good ones, but it would seem better to eliminate, if possible, the underlying causes, rather than to complicate the brake mechanism by additional parts. The Baldwin Locomotive Works is making a careful investigation of this question at the present time.

The side swing of a car can be limited in a variety of ways, but the usual, and perhaps the best, method is by expending the energy in work performed in lifting the weight

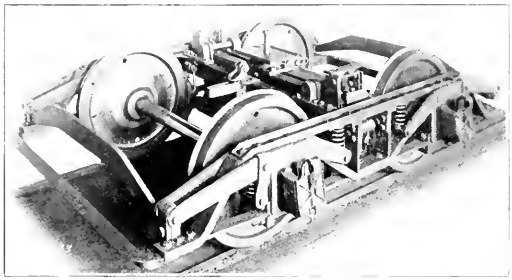
of the car body. Generally, therefore, the truck bolster and the bolster springs are carried upon a spring plank, which is suspended from fixed points at the top of the transom by means of links called swing links, in such a manner that it can move sidewise only. Every side movement of this spring plank being attended by a lifting of the car body, the energy is expended in work, thereby limiting the amount of swing. Gravity acting upon the car body brings the spring plank back into place.

Inclining the swing links toward the center of the truck increases the height through which the car body is lifted per unit of side swing of the spring plank, thereby decreasing the amount of swing of spring plank. The car body is at the same time thrown out of its vertical and its swing becomes less than that of the spring plank itself.

The shocks which occur when bolster swing is limited by springs between bolster and frame are eliminated by this method.

Wheels.

While chilled cast-iron wheels are still used extensively in electric street railway service, solid forged steel or steel-tired wheels are now almost universally used upon interurban



Electric Trucks—Figure 6—Recently Designed Truck with New Method of Suspension for Outside Hung Motors.

electric railways upon which the severity of the requirements has reached such a stage that chilled cast-iron wheels may no longer be considered even comparatively safe.

The most important requisites of a wheel are strength and durability, with a minimum of weight, and it is probable that the solid steel wheel will eventually replace the built-up wheel. The steel used in rolled and forged solid wheels is exactly the same as that used for tires of medium hardness and its method of manufacture seems to increase the density of the material.

Brakeshoes having unequal coefficients of friction will vary the flange wear directly; also indirectly through varying the diametrical wear of the wheel tread.

[The author then exhibited lantern slides illustrating a few of the designs of motor and trailer trucks built by the Baldwin Locomotive Works.—Eds.]

Figure 5 shows an inside hung truck, designed for a specified maximum center pin load of 28,000 pounds; wheel base, 80 inches; wheels, 34 inches in diameter; journals, 5 by 9 inches; brakes, inside hung; bolsters, cast steel.

Figure 6 shows a truck designed for Westinghouse 101-B motors, outside hung, and for a specified maximum center pin load of 17,000 pounds; wheel base, 54 inches; wheels, 33 inches; journals, 3¾ by 7 inches; total weight, exclusive of motors, 6,100 pounds. The weight of this truck, exclusive of wheels, axles, brasses and wedges, is approximately only 2,600 pounds. The method of motor suspension has recently been patented by B. R. Van Kirk, mechanical engineer of the truck department of the Baldwin Locomotive Works. The motor weight upon the suspension is fulcrumed over the driving box and applied to the frame in an upward direction at a point near the center of the truck. This relieves the end frame of the motor weight and decreases the tilting effect of the motor reactions.

Maintenance.

The maintenance cost of a Baldwin truck should be small, but the old adage, "A stitch in time, etc.," holds good. The experience of more than three-fourths of a century of locomotive building has been applied to the design and construction of the trucks. The characteristics of the Baldwin locomotive are combined with the advantages of the M. C. B. running gear. The materials and workmanship conform rigidly to locomotive specifications.

ANNUAL MEETING NEW ENGLAND STREET RAILWAY CLUB.

The annual meeting of the New England Street Railway Club was held at the Hotel Somerset, Boston, on Thursday of the present week. The following officers were elected for the ensuing year:

President—Matthew C. Brush, vice-president and general manager Boston Suburban Electric Companies, Newtonville, Mass.

Vice-Presidents—W. D. Wright, master mechanic the Rhode Island Company, Providence, R. I.; C. H. Hile, assistant to vice-president Boston Elevated Railway; C. E. Hubbard, general manager Farmington Street Railway, Hartford, Conn.; J. Brodie Smith, general manager Manchester (N. H.) Street Railway; J. H. Foote, general manager St. Albans (Vt.) Street Railway; E. A. Newman, general manager Portland (Me.) Railroad.

Secretary—John J. Lane, Boston.

Treasurer—N. L. Wood, Boston.

Executive Committee—Henry C. Page, vice-president and general manager Springfield (Mass.) Street Railway; Alba H. Warren, manager Brockton & Plymouth Street Railway, Plymouth, Mass.; George W. Palmer, Jr., Boston; Franklin Woodman, general manager New Hampshire Electric Railways, Haverhill, Mass.; George W. Knowlton, Boston; H. R. Luther, Cambridgeport, Mass.

Finance Committee—M. C. Brush, Newtonville, Mass.; J. F. McCabe, purchasing agent Worcester (Mass.) Consolidated Street Railway; E. P. Shaw, Jr., general superintendent Boston & Worcester Street Railway, South Framingham, Mass.

Matthew C. Brush, the newly elected president, is a well-known street railway man, being vice-president and general manager of the Boston Suburban Electric Companies, with office at Newtonville, Mass. Mr. Brush graduated from the Armour Institute of Technology in Chicago and from the Massachusetts Institute of Technology, Boston. He has had a broad steam railroad and steamship experience, together with street railway experience, for several years past. He was purser on the great lakes for the Northern Steamship Company for five years; machinist, foreman and roundhouse foreman on the Union Pacific Railroad at Omaha, Neb.; general foreman in charge of shops and roundhouses Chicago Rock Island & Pacific Railway in western Kansas. Mr. Brush commenced his street railway work in 1903, when he was appointed assistant to the president of the Boston Suburban Electric Companies. The following year he was made general manager of the Newton Lexington & Natick Railway systems and in 1905 was elected vice-president of the same companies. Mr. Brush has been very active in the New England Street Railway Club since he has been located in New England, serving on various committees of the organization. In 1907 he was elected vice-president.

Matthew C. Brush.

The dinner, which was held at 6 o'clock in the evening at the Hotel Somerset, was presided over by Charles C. Peirce as toastmaster. Samuel L. Powers of Boston responded for the commonwealth of Massachusetts. No state, he said, is better served in the matter of transportation facilities and better relations are coming between the companies and the public. One-ninth of the entire wealth of the United States is invested in electric and steam transportation and fair legislation is imperative.

James F. Shaw, Boston, responded for the American Street and Interurban Railway Association. He discussed the objects of the national organization and emphasized the need for increased fares in New England if reasonable dividends are to be realized. The present franchise taxes and stock laws of Massachusetts are too severe for the necessary development of commercial industries in the state, he said.

T. E. Byrnes, vice-president of the New York New Haven & Hartford Railroad, Boston, then spoke on the need for broader co-operation between the New England people in the interest of better commercial development and the modernization of industry in that section.

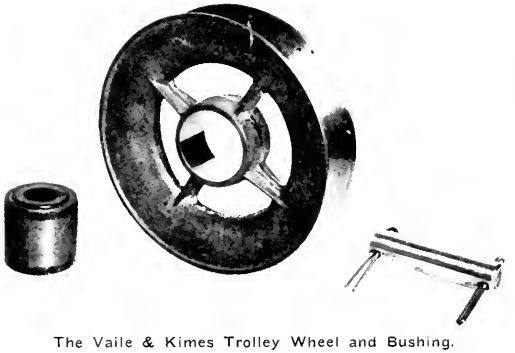
George A. Post, president of the Standard Coupler Company, New York, was the last speaker of the evening and delivered a witty address.

During the meeting a standing toast was drunk to the recovery of Governor Guild of Massachusetts from his serious illness.

TROLLEY WHEELS, HARPS AND POLES.*

BY ADAM COLE, VAILE & KIMES COMPANY, DAYTON, O.

This subject is an important one in electric railway equipment and it is not receiving the attention it should. We manufacture the V. & K., Simpson's patent, oilless bearing trolley wheels. Thousands of dollars have been spent and



The Vaile & Kimes Trolley Wheel and Bushing.

hundreds of trials and experiments have been made by us. The oilless bearing feature was a success from the start, but the manner in which it was used in many cases proved that this feature was no advantage if not properly used. Our bearings are all made under one process, with no deviation whatever.

After sending out trial wheels reports came back that our wheels had made mileages which ran into thousands, and in numerous cases sounded ridiculous. Reports also came that our wheels had made but a few hundred miles, and were not suited for their work. No two systems of railways are the same, and conditions vary materially. A variation in mileage of from 3,000 to 36,000 miles set us to thinking and we immediately made an investigation to locate the trouble. We found that where the wheels had failed the trouble was due wholly to the harp.

We believe that every one present will agree that the spindle should fit as tightly as possible in the harp, and yet be capable of easy removal. In the past, if the spindle fitted tightly in the beginning, it was but a short time until the spindle, as well as the shell, began to show wear. This was caused by the constant hammering on the overhead wires. Our wheel was assembled in the harp with a loose-fitting spindle, and as our wheel had a greater conductivity than other wheels, an arcing took place, and hence the bearings were of short life. From our experience we believe that a good fitting spindle in the harp will increase the life of any wheel. It was not our intention to go into the harp business, but we were forced into it by the results of our experiments.

In assembling wheels in harps a hammer should never be used. I have in mind a case where a new wheel was being placed on a car. The man who was doing the work simply threw the pole and wheel from the car to the ground and ruined the wheel. Many good dollars could be saved annually by dispensing with careless employes.

*Abstract of paper read before the Central Electric Railway Association at Indianapolis, Ind., March 26, 1908.

Trolley Poles.

A pole of a given length should be of uniform weight. A 12-foot pole should weigh, say, 22 pounds. If you place an order for 100 poles, each to be 12 feet long, and to weigh 22 pounds, a little care on the part of the manufacturers will assure delivery of poles weighing within a few ounces of the specified weight. At present poles will vary as much as six pounds.

In applying trolley poles to the car you may have the tension on the base set for 20 pounds. A new pole possibly weighs six pounds in excess, or one-fourth more, than the pole discarded. It is applied hurriedly, and when the car is a few miles away you receive a telephone message that the wheel will not stay on the wire. The wheel is then at once condemned, when the fault should be charged to the weight of the pole. Another matter of vital importance is that of a close fit between harp and pole. Did you ever see a harp that fitted tightly on the pole, or where there was a good contact? Too much stress cannot be laid upon the importance of this. Ordinarily, about all the contact you have is the rivets that go through the harp and pole. The loss of power is surely great. This evil can be remedied easily by having the end of the pole turned to a standard size, say for three or four inches. Then the harp should be bored and reamed to a standard size, say 1-64 inch larger. The ends of the poles should not be painted, but a grease of some kind should be used to prevent rusting, and the ends should be thoroughly cleaned before the harps are placed in position. It is a well-known fact that grease or oil is a non-conductor. By this method almost a perfect contact would be obtained at that point. Would the manufacturers of trolley poles do the turning? Manufacturers are usually willing to comply with reasonable demands from their customers, as the additional cost would be small. A hollow spindle lathe could be used, and what is known as a box tool, and the poles could be turned out as rapidly as two men could handle them. The users of poles could well afford to pay the additional cost.

Up to the base we believe every effort has been exercised to make the equipment almost perfect, but from the base to the overhead wire it has been sadly neglected.

Many electric roads have realized the importance of the standardization of their equipment as far as it is possible. A number of roads operate different lines, some as many as seven, and have almost as many sizes of wheels, harps and pins. The roads are now figuring what sizes will best suit the combined system and are adopting one size for all of the lines.

Selection of Materials for Concrete.

The importance of careful discrimination in the selection of materials for the making of concrete is forcibly shown by Leonard C. Wason, president of the Aberthaw Construction Company, Boston, in a recent paper, in part as follows:

"In the selection of sand care should be used to avoid that which is fine and not sharp. The difference in strength due to these qualities alone in some tests of the writer's on sand that was used in foundations amounted to a loss of 52 per cent from standard sand. Dirt should also be avoided. There has been some controversy as to how much can be permitted but the writer believes that the ordinary test which is performed on the work of throwing a handful into a glass of water is sufficiently reliable for all cases. When the water is badly muddied and remains clouded for a considerable time, the sand should be washed or rejected.

"There is little difference obtained in results of broken stone or gravel. By actual test the writer has found that a broken stone having a rough surface with angular fractures will give an increase in strength over a rough bank gravel of about 15 per cent in most cases. In some, however, the gravel has given the greatest strength. If the stone has a glossy surface, such as is found with some trap rocks, the gravel will always give the greatest strength. In the first instance, if the specifications required 1:3:6 broken stone concrete and there is a difference in cost between broken stone and gravel screenings of 0.02 per cubic foot, it will be cheaper to use a mixture of 1:2½:5 with gravel and still obtain an equal strength with the broken stone. The writer makes the rule never to allow the size of stone in its greatest dimension to be more than half the thickness of the work into which the concrete is to be placed. In large size work, very much larger stone can be used than is ordinarily done with very good results, the only limitation being that of convenience in handling."

MULTIPLE CAR OPERATION IN ST. JOSEPH, MO.

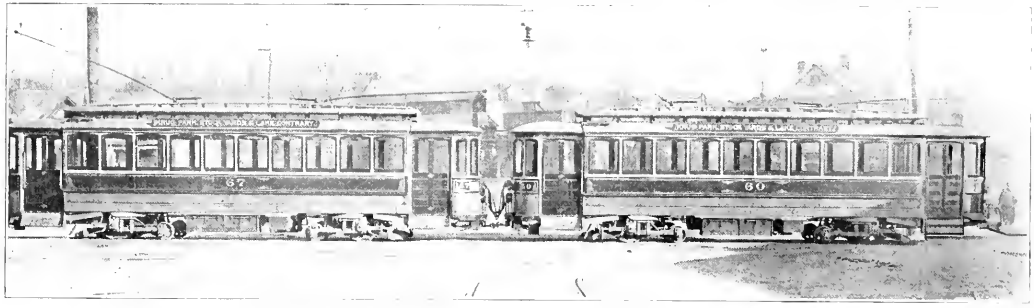
The St. Joseph Railway Light Heat & Power Company of St. Joseph, Mo., has had in service for several months 10 cars which are especially well adapted to their service requirements. Among other services the company does a large summer business in providing transportation facilities to amusement parks and resorts about St. Joseph, the most notable of which is located on Lake Contrary, where the company owns 230 acres of land on the east shore of the lake. At certain hours during the summer months the traffic becomes unusually heavy between the city and this park, and at all seasons of the year the traffic during the morning and evening rush hours between St. Joseph and South St. Joseph, where the stock yards are situated, is unusually heavy.

With the growth of the popularity of these amusement parks and the increase in other traffic it became necessary to increase the facilities. Until the season of 1907 this was done by the use of dead trailers drawn by motor cars. Three and four trailers were frequently used in a train. To make reasonable schedules under these conditions required the use of heavier motors than there was need for during the hours when the use of trailers was not necessary. To overcome this necessity for hauling about, wearing out and supplying current to heavy motors during the hours of light traffic, the company equipped a number of light trailer cars with second-hand G.E.-800 motors, equipped for multiple control train operation in connection with ordinary motor cars. Trail cars thus equipped are called "live" trailers. These "live" trailers are not provided with trolley poles, but take their power from the motor car ahead.

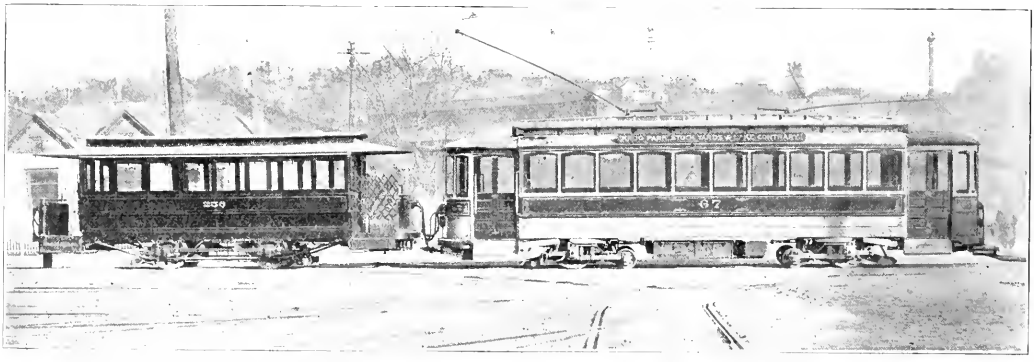
In the spring of 1907 the company purchased ten 12-bench open car bodies, mounted on Brill 22-E maximum traction trucks with forged steel frames, 33-inch driving wheels and 18-inch pony wheels. On each truck of these cars is mounted a G.E.-90 50-horsepower motor with a gear ratio of 4.06 to 1. During the past season 10 closed bodies were purchased by the company for its winter business, the same trucks being used under both open and closed bodies.

Electrical Equipment.

Both the open and the closed bodies are fitted complete with controllers, couplers and air brake equipment, so that the changing of bodies on the trucks requires only about an hour's time. Both bodies are fitted with the General Electric emergency and straight air brake equipment the two pipe lines running the full length of the car and being attached to coupler hose entering at the dash. The bodies are equipped with seven main power buses. The main motor circuits are tapped at the reverser and are brought into a 7-conductor cable which terminates at a 7-point coupler box located at the dash of the car. These coupler boxes enable a connection of



Multiple Car Operation in St. Joseph, Mo.—Two Motor Cars Coupled for Multiple Operation.



Multiple Car Operation in St. Joseph, Mo.—Motor Car Coupled to Live Trailer.

the new cars with "live" trailers equipped with motors, as already mentioned.

In addition to the 7-point coupler a 9-point coupler box is also provided on the dash, which makes it possible to connect together two of the new motor cars for regular multiple-unit operation, in which case each car takes its power over its own trolley. The controllers are of the Sprague C-6 type, made by the General Electric Company, and are for 4-motor control. Controllers are placed in both ends of the cars. The coupling arrangements for both air and current permit of flexible operation which has proved entirely satisfactory after a season's trial. It has resulted in a great

improvement in the schedules and a greater reliability of service. The company proposes to continue the use of this style of equipment in increasing its facilities and will probably so equip all its rolling stock.

The open car bodies which are used in summer are illustrated in one of the accompanying engravings. The following are their principal dimensions: Length over vestibule fronts, 38 feet 10 inches; length over bumpers, 40 feet $2\frac{3}{4}$ inches; width of car over sill plates, 6 feet $10\frac{1}{2}$ inches; width over posts at top of seat, 7 feet $8\frac{5}{16}$ inches; width over running boards down, 8 feet 8 inches; sweep of post, 5 inches; height from bottom of sill to top of roof, 8 feet 11 inches; height from top of floor to inside of roof, 7 feet $9\frac{5}{8}$ inch. The underframe is of wood with longitudinal sills encased outside by a steel plate and on the inside and bottom by $3\frac{1}{2}$ by 6 inch angles. The details of arrangement are shown in the drawing. The interior, seats and posts are finished in ash and the headlining is of birdseye maple. The Sterling-Meaker No. 12 printing registers used are operated by ringing rods supported on side brackets, the bell cord being carried on the same bracket. Incandescent bulbs are used for lighting, the headlight and destination sign on the dash also being lighted by bulbs. Roofs are provided with eave troughs draining to down spouts at the corners to prevent dripping over the

running board. The bench seats over the trap doors are pivoted to facilitate the repairing of motors.

Closed Bodies.

The 10 closed car bodies intended for use in winter service were delivered in September, 1907. They are illustrated herewith by reproduced photographs and drawings. The principal dimensions are as follows: Length over end panels or sills, 38 feet 10 inches; length over vestibule fronts, 40 feet 8 inches; length of platforms in the clear, 6 feet; length over bumpers, 42 feet; width over sills, 6 feet 11 inches; width over posts above belt rail, 7 feet 11 inches; width over all above belt rail, 8 feet 3 inches; sweep of posts, 6 inches; height from bottom of sill to top of roof, 9 feet; height from top of sill to inside of roof, 8 feet 2 inches; height from bottom of sill to under side of roof plates, 7 feet.

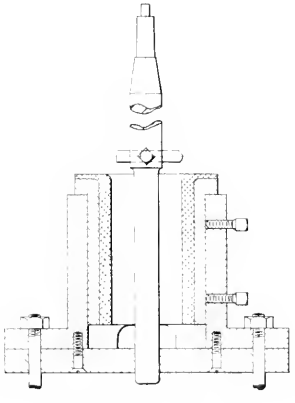
The cars have longitudinal seats, which are considered more desirable than cross seats because of the small width of the cars and the necessity for hauling heavy loads during the rush hours. The cars are finished inside with cherry, the headlining being 3-ply birdseye maple. The windows, sashes, sills, molding and frames are in cherry and the vestibules are wainscoted with ash. Central rod ringing devices supported on triangular brackets of special design are used, the bell cord as in the open cars being supported on the rod brackets. The same register is used as in the open bodies. The 6-foot vestibules are equipped with Brill patent folding doors on each side of each vestibule, giving an entrance at each corner of the car. Lighting is, as in the open cars, done by incandescent bulbs.

The cars herein described were built by the American Car Company of St. Louis, Mo. We are indebted to C. F. Hewitt, general superintendent of the St. Joseph Railway Light Heat & Power Company for drawings reproduced herewith.

BORING ARMATURE BEARINGS.

An efficient and inexpensive method for boring out armature bearings with an ordinary drill press is in use in the railway shops of the Quincy Horse Railway & Carrying Company, Quincy, Ill.

Each armature bearing is bored to a size that will fit each armature shaft This is done by an ordinary drill press with simple arrangement consisting of a boring rod turned down to fit the spindle socket of the drill, and a jig for holding the bearings. The jig is bored out to a size to fit the outside diameter of the bearing, which is held from turning by two set bolts. The flange of the jig is fastened by two bolts to a guide plate, in the center of which is a hole the size of the long boring rod and through which the rod passes. By this arrangement the center of the bearing is easily located. A. Johnson, master mechanic of this road, states that the device does the work just as well and as quickly as a more expensive and complicated machine and its simplicity makes it possible for anyone to do the boring.



Cross Section of Jig for Boring Armature Bearings.

ELECTRIC RAILROADS IN INDIANA.

The second annual report on the electric railroads of Indiana, compiled by the state statistician for the year ended June 30, 1907, includes data from 41 companies operating street and interurban roads, as compared with 32 companies for the year 1906. The number of miles of main track owned and operated in 1907 was 1,607, as compared with 1,112.66 owned and 1,286.73 operated in 1906. (Statistics compiled by the Indiana railroad commission, which were published in the Electric Railway Review of January 4, 1908, page 18, show 1,538.93 miles of interurban railroad, not including street railways.) The gross earnings of street and interurban roads for the year were $10,238,776.80, as compared with $8,712,775.72 in 1906. A classification of the earnings and expenses follows:

Earnings.

	1907.	1906.
From passengers	$9,080,872.26	$7,411,093.36
From freight	389,052.69	527,612.05
From mail	5,471.28	4,501.39
From rentals	321,875.86	197,492.91
From all other sources	441,504.21	552,076.01

Expenses.

	1907.	1906.
Maintenance of way and structures	$ 544,522.68	$ 501,854.07
Maintenance of equipment	674,722.48	558,655.37
General expenses	310,698.57	1,260,533.76
Conducting transportation	2,964,573.48	2,517,547.28
Additions and betterments	806,242.21	702,866.02

The number of passengers carried by the street and interurban lines of Indiana during 1907 was 152,867,595, and the total number of tons of freight carried was 179,685.

Compensation.

The amount of wages and salaries paid to the various classes of officers and employes is shown in the following table:

	Number employed.	Total number days worked.	Total yearly compensation.
General officers	106	3,467	$233,428.56
Other officers	63	20,796	70,109
General office clerks	220	70,318	119,915.45
Station agents	202	68,290	69,371.74
Motormen	1,105	360,235	687,920.24
Conductors	1,061	358,423	668,820.26
Linemen	156	44,911	102,301.97
Electricians	271	45,864	84,026.64
Mechanics	372	115,110	254,046.27
Section foremen	169	57,447	116,369.05
Operators and dispatchers	60	21,659	42,225.23
All other employes and laborers	1,934	527,826	795,950.71

Accidents.

The persons killed or injured in accidents on the electric railroads of Indiana during the year are classified as follows:

	Passengers.	Employes.	All others.
Amount of damages paid during year	$37,533.33	$4,976.19	$171,487.83
From causes beyond their own control—			
Killed	3	1	6
Injured	245	51	38
From their own carelessness—			
Killed	8	7	42
Injured	2,097	297	2,398

An electric railway system comprising 23 miles of track has recently been completed in Shanghai, China. The trackage has been divided into 11 sections, the first-class fare for traveling over any one of the sections being 2½ cents. The motormen and conductors will be Chinese, but twice during each journey a foreign inspector will visit each car. The terms of the concession permitting the construction of the road do not allow any exterior disfigurement by advertisements. Each car is divided into two compartments, which seat 12 first and 20 second class passengers, respectively. Notices in English, French and Chinese warn passengers against smoking or spitting and prohibit the carrying of dogs on the cars.

MEETING OF THE NEW YORK RAILROAD CLUB.

The regular monthly meeting of the New York Railroad Club was held on the evening of March 20. As this was the fourth annual electrical night a programme was arranged consisting of several short talks by men who are authority on the subjects of electricity as applied to railway operation. About 600 members and guests were present; President Vreeland presided.

A description of the construction, signal installation and electrification of the tunnel systems of New York was presented with illustrative lantern slides by L. B. Stillwell, electrical director Interborough Rapid Transit Company; J. M. Waldron, signal engineer; and Hugh Hazleton, electrical engineer Hudson & Manhattan Railroad. Commenting on the advancement in transportation facilities in New York City, Mr. Stillwell said that between September, 1907, and February, 1908, there had been six tunnels completed and while there had been considerable progress in the development of construction and operation there was nothing radically new. The evolution of the small trolley car as first operated by electricity to a train of several cars operated as a unit marks a period of progress in the New York systems. He said the Interborough Rapid Transit Company, including both elevated and subway lines, made 326,357 car-miles a day, carrying 1,519,000 passengers daily. Mr. Stillwell's discussion of the Forty-second street tunnel of the New York & Long Island Railroad was accompanied by views showing a profile of the new tunnel as far as completed and the installation of the overhead contact rail and pantagraph. This contact rail weighing 20 pounds to the yard is hung from the top of the tunnel over the center of the track by means of an insulated bracket adjustable in four directions and supported at intervals of nine feet. On account of the slight clearance it was necessary to design a pantagraph occupying when in its lowest position but eight inches under the base of the contact rail.

To provide for the leakage or an extraordinary discharge of water in the East river tunnel of the Interborough company, sumps were constructed with a capacity of 50,000 gallons. Six electrically operated pumps of the Cameron type with a capacity of 600 gallons per minute are provided, which it is calculated will under any conditions keep the tunnel free from water.

Mr. Waldron in speaking of the new features of the signal apparatus in the East river tunnel said that the grades approaching the Manhattan and Brooklyn sides were 3.1 per cent and that blocks had been installed at intervals of sufficient length to permit a train to come to a full stop when traveling at the rate of 60 miles per hour. He said that the tunnel signaling was designed with a view to eliminating if possible the blocking of trains while in the tunnel, as each stop meant a loss of from 12 to 15 seconds, the time required to get under full headway again. An effort is being made to get the authority to install at the approaches of express stations a track indicator similar to the one in the Bowling Green station. If the authority can be secured it will permit of the operation of two additional express trains.

Hugh Hazleton in reviewing the Hudson tunnels said that by January 1, 1909, it was expected that 16 miles of the tunnels will be completed and in operation. Estimating the value of the East river tunnel as a means of relieving the congestion of the Brooklyn bridge during rush hours Mr. Hazleton said that the tunnel carried from one-tenth to one-sixth and the bridge about one-eighth of the total number of passengers crossing the river each day. A feature of the Church street and Hoboken terminals of the Hudson tunnels will be the method of loading and unloading the cars. It is arranged that all passengers getting off will go out one side of the car and the outgoing passengers enter from the opposite side. The protection board over the contact rail is of jarrah wood imported from Australia and, having a fiber much harder than oak, is almost incombustible. A test of the jarrah wood, oak and pine was made to ascertain which, in case of fire in the tunnel, would resist combustion the longest. It was found that jarrah would withstand the flames of a blow torch 11 minutes, oak 8 minutes and pine 2 minutes, and that upon the removal of the torch the jarrah wood that had ignited would cease burning. Several views were shown and a description given of the new cars; also of the power house in Jersey City, which is now under construction and which will be equipped with two 3,000 and two 6,000 kilowatt turbines of the Curtis type.

W. J. Wilgus spoke of the operation of the New York Central electric zone since its completion last July, stating that all trains are now operated by electricity successfully both from an operating and financial standpoint. In a terminal like that at New York with electrical operation it is feasible to use other than ground surface, greatly increasing the value of the property. A considerable saving of money can also be made in lighting the yards and terminals, as where a power house is necessary for train operation current for lighting can be arranged for with little additional expense, and the saving in the New York Central zone for lighting of yards was placed at $200,000 per year. Also a large power house provides cheaper current for labor-saving devices, such as motors for drawbridges, cranes, moving platforms, etc. Another economy in the substitution of electric for steam locomotives is the saving of power in hours when travel is very light. Mr. Wilgus said that in one yard he had in mind a saving of $114,200 per year could be effected. Another feature of the electrically operated train was the substitution of automatic check devices for an additional motorman on the locomotive.

W. S. Murray, electrical engineer of the New York New Haven & Hartford, spoke briefly on the electrification work of the New Haven between Stamford and Woodlawn. He said the New Haven has ordered a few equipments to try out the multiple-unit control system.

George Gibbs, consulting engineer Pennsylvania & New York, read a paper referring to the many engineering problems in railway operation that had been successfully solved by the use of electricity as a means of power.

Walter C. Kerr of Westinghouse, Church, Kerr & Co. presented a paper describing the advancement that had been made in the electrification of trains or train signaling, in the course of which he said that he had wondered why more work in the application of electricity to the operation of trains had not been done. The one great drawback was first cost and the time had come to reduce this cost. He said in work of this character it was necessary to get good men on the job and then keep them there.

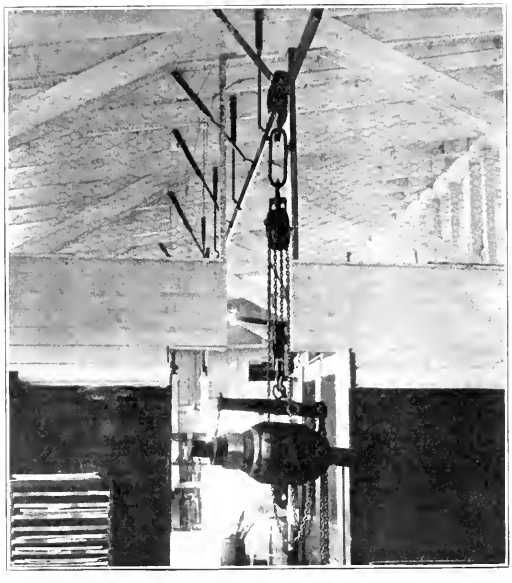
B. G. Lamme, chief engineer Westinghouse Electric & Manufacturing Company, gave a talk on the "Freight Locomotives for the Spokane & Inland Single Phase Railway." After reviewing briefly the nature of the roadbed, grades, lengths of hauls, etc., of the system, Mr. Lamme said that they had found in the type of locomotive first used on this line that the motor could not pull continuously a heavy train up grade on account of heating, but that, in new equipment built, motors of greater capacity were used, with the result that the desired operating features were obtained. A steam locomotive can develop a maximum continuous tractive effort, but the electric locomotive cannot stand continuous extra tractive effort, therefore the heating of the motor fixes the tractive effort of the electric locomotive. He said that the question of how long it will be until the steam locomotive is eliminated had come to his attention so many times that he had done some figuring on the matter and found according to his figures that if every railway were to begin now to do nothing else but build electric locomotives it would take from 10 to 20 years to replace the steam equipment, this not providing the increase in capacity during that time.

William McClellan of the Campion-McClellan Company said it had been proved that with the electric locomotive equipped with multiple control all work can be done that has formerly been done with the steam locomotive. He said that in the future development of electrification great problems would have to be overcome, but that no greater problems will have to be solved than have already been. Of the five systems—third-rail system, single-phase, three-phase, 1,200-volt direct-current and gasoline-electric systems—probably one of these would be better adapted to meet the requirements of certain sections, but in the electrification of a road the engineer must stand far enough away to get a broad view of the entire subject and then install a type of electrification best adapted for the road's needs.

SHOP WORK AT TAMPA.

BY LEWIS P. M'CARTY, MASTER MECHANIC.

In the shops of the Tampa (Fla.) Electric Company we have lately installed for facilitating our repair work, two overhead hoists, one for raising car bodies and another system of traveling hoists.



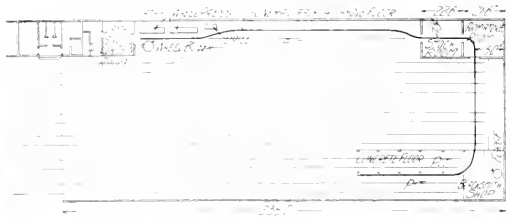
Tampa Shops—Traveling Hoist Carrying an Armature.

One of the accompanying halftone engravings shows the first overhead hoist which we built. An illustration reproduced from a line drawing also shows the location of the supporting trolley rail for the hoist which serves the various departments of the shops and car house. The rail hung from the roof structure of the building is an iron bar 4 by 1 inch in section held in place by hangers and braces of ⅝ by 2 inch iron. The supports are six feet apart and between each pair of supports is a diagonal brace. The traveler which runs on this overhead rail carries the upper block of a set of differential pulleys and by means of this hoist and trolley heavy parts, such as wheels, axles, armatures, etc., can easily be lifted and transported between the various tools and parts of the building. The overhead structure is of sufficient capacity so that we can carry loads of about 2,000 pounds.

This very effective means for handling heavy material was built complete in our shops at a cost of $80 for labor, including blacksmithing, drilling and erecting, and $125 for iron.

Another illustration from a photograph shows a car body hoist which we built and which cost for timber, building and erecting about $225. This cost included raising the track rails and building the pit and the adjacent concrete floors.

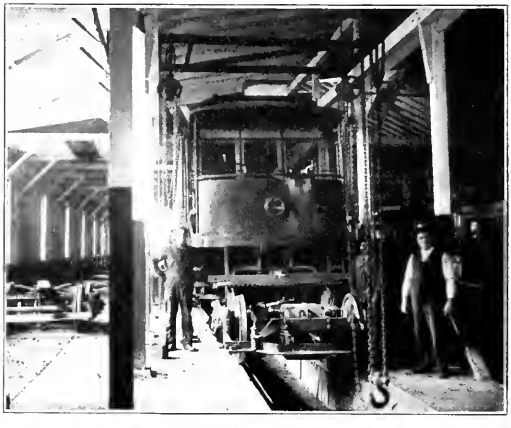
The existing posts in the shop that supported the roof were used and opposite these were set on 11-foot centers five other posts to carry the overhead runway. The track is 55 feet long and the stringers are 8 by 8 inches in section, with bolsters underneath. On top of these stringers are rails made of ⅝ by 2 inch iron. The carriage was made from an old truss taken out of a dismantled building. It is built of 4-inch angle irons and was cut to fit the span, which is 12 feet. The carriage is five feet wide and runs on 8-inch wheels having their journals in pieces of I-beams forming the ends of the carriage. Sections of 60-pound T-rails are laid across the top of the carriage supporting the two 5-ton chain hoists.



Tampa Shops—Plan Showing Location of Overhead Runway for Trolley Hoist.

With this rigging two men have changed wheels in 1¾ hours, while with the old way it took four men to jack up the car and perform the same task.

Some of our standards and specialties are as follows: American inserted brakeshoe; Decatur car wheels, 20, 30 and 33 inches in diameter; 12-foot trolley poles with 22 pounds tension 16 feet from the rail, using 5-inch Kalamazoo wheels; body color, orange yellow, which is found very satisfactory for our local conditions, the paint and varnish being made by Lowe Brothers, Dayton, O. Castile soap only is used for washing cars. We find it very good practice to groove the armature bearing on the commutator end, thus keeping the oil from flowing out.



Tampa Shops—Hoist and Chain Blocks for Handling Car Bodies.

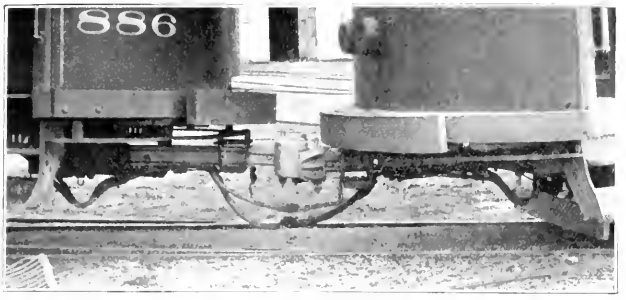
Our rolling stock comprises about 60 cars, four of which are of the Brill semi-convertible type.

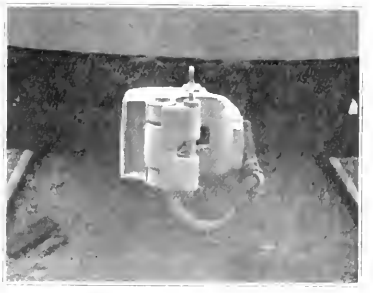
THE GIBBS AUTOMATIC COUPLER.

W. A. Gibbs, district manager Ohio Electric Railway Company, Columbus, O., has designed and thoroughly tested an improved coupler head, which he is preparing to put on the market. The coupler is of the M. C. B. type, differing only in the addition of a pocket on the side, into which a guard arm of the opposing coupler mates. The guard arm is of such length that it extends to the bottom of the pocket in the opposing coupler. This feature is said to make the coupler absolutely rigid sidewise and to prevent it from buckling when used with radial drawbars on street and interurban cars. The guard arm, extending into the pocket, is arranged to give the couplers a certain predetermined amount of vertical play, thus allowing for unevenness in the track. They cannot unhook vertically because when the end of the guard arm strikes either the top or bottom of the pocket it can go no farther.

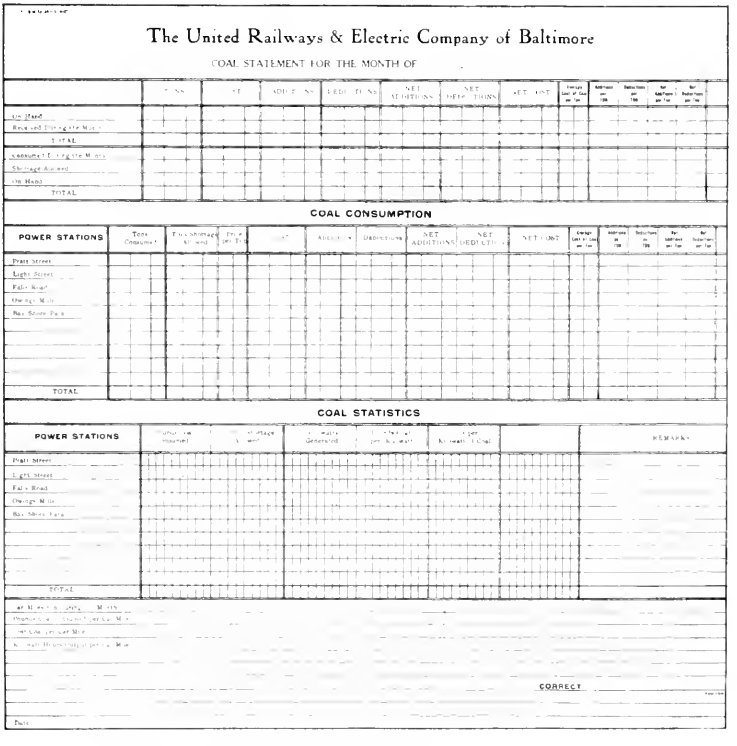
The couplers are so made as to allow for their coupling when one bar is higher than the other. In the one illustrated this variation in drawbar height may be four inches. Another illustration shows two 60-foot cars with 40-foot truck centers standing on a 50-foot radius curve, in such a position that this feature is demonstrated.

The coupler head is made on exactly the same lines as the M. C. B., and in the same size, operates as perfectly with it as it would if the pocket were not attached.





Gibbs M. C. B. Type Coupler—Views Showing Cars Coupled on Sharp Curve—Enlarged Front View Showing Pocket.



The United Railways & Electric Company of Baltimore

COAL STATEMENT FOR THE MONTH OF

COAL CONSUMPTION

COAL STATISTICS

United Railways & Electric Company—Blank Form for Monthly Coal Statement.

MONTHLY COAL STATEMENT.

As a basis for exhibiting the various data regarding the supply and consumption of coal used for power generation by the United Railways & Electric Company of Baltimore, W. A. House, president, has designed the accompanying blank form. A casual inspection will show the very complete record here presented. One of these statements made out in full is compiled by the department heads each month.

Fox River Railway and Lighting Association.

An organization to be known as the Fox River Valley Railway and Lighting Association has been formed in Wisconsin. The object of the association is to bring into closer touch the officials of the railway, gas and electric properties in the Fox river valley with a view to promoting more complete co-operation in the work of the various railway and lighting companies represented. The companies composing the association are all in Wisconsin and include the following: Eastern Wisconsin Railway & Light Company, Fond du Lac; Winnebago Traction Company, Oshkosh Gas & Electric Company, Oshkosh; Appleton Street Railway & Lighting Company, Appleton; Green Bay Traction Company, Green Bay. N. C. Draper, president of the Eastern Wisconsin Railway & Light Company, has been elected president, and A. K. Ellis secretary and treasurer.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY I. T. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Liability for Injury to Person Going on Narrow Platform Between Tracks to Take Car.

Chunn v. City & Suburban Railway of Washington, 28 Supreme Court Reporter, 63.—The supreme court of the United States says that at a point where it was customary to board the defendant's cars from a platform there were two tracks, running north and south. The distance between the inner rails of the two tracks was 7 feet, 10 inches, and between two cars when they passed, 3 feet, 6 inches. The plaintiff, who had come there, had come to a place where passengers had habitually boarded the defendant's cars. The defendant had encouraged and invited persons to enter its cars going south from the space between the tracks, by opening the doors and receiving them from that side. It was a place which, in itself, was perfectly safe, unless made otherwise by the manner in which the defendant used the east track for the passage of cars. The plaintiff, therefore, was not a trespasser nor a mere traveler upon the highway. It was not important to determine whether she had become a passenger. Intending to become a passenger, she had come to a place recognized by the practice of the defendant as a convenient and suitable one from which to enter the car, and the car stopped to receive her.

The defendant owed the plaintiff an affirmative duty. It was bound to use that care for her protection which was reasonably required in view of the situation in which she had, at the defendant's invitation, placed herself, of the purpose for which she was there, of the approach of the car which she was intending to enter, and of the dangers to be apprehended from contact with a rapidly moving car, propelled by mechanical power. A jury might well say that, under such circumstances, reasonable care demanded the exercise of the utmost vigilance, foresight and precaution.

The motorman of the northbound car could see plainly that the southbound car for Washington was about to stop, and that passengers were standing upon the space between the tracks, intending to enter it. He might readily have understood that the noise of the transit of the two cars would be commingled, and that those who intended to enter the other car would naturally direct their attention to it, and might fail to notice the approach of his own car. In point of fact, the motorman took no precaution whatever; he assumed that those who were standing on the platform would take care of themselves, and ran his car by them at full speed as if oblivious of their existence. The court thinks that from the evidence the jury might have found that the defendant was negligent.

Nor does the court think that it could be said, as a matter of law, that the plaintiff was guilty of contributory negligence. There was room to stand between the two cars and escape contact with either. But the margin of safety was narrow and left little allowance for the infirmities of mankind. In the confusion of two cars, approaching from opposite directions, it was too much to expect nice calculations of distances. It was not to be wondered at that in the attempt to escape the one, the plaintiff fell foul of the other. The court thinks that the plaintiff, if she was rightly where she was, was not, as a matter of law, guilty of negligence in failing to appreciate accurately the boundaries of the narrow zone of safety which the defendant's conduct had left to her. The 3-foot 6-inch width of the clear platform could not fairly be considered without taking into account the dangers which infested the borders upon each side.

The plaintiff was not necessarily wanting in due care by taking her place between the tracks. It was the usual place from which entrance to the Washington car was made. It was safe enough under ordinary circumstances. It was made unsafe only by reason of the defendant's negligent act in running another car rapidly by. The plaintiff had the right to assume that the defendant would not commit such an act of negligence, and that, when it stopped one car and thereby invited her to enter it, it would not run another rapidly by the place of her entrance and put her in peril.

Nor was it clear that, even if the plaintiff was not free from fault, her negligence was the proximate cause of the injury. If she carelessly placed herself in a position exposed to danger, and it was discovered by the defendant in time to have avoided the injury by the use of reasonable care on its part, and the defendant failed to use such care, that failure might be found to be the sole cause of the resulting injury.

Passenger on Platform Falling Off After Opening of Door by Conductor.

Nirk v. Jersey City, Hoboken & Paterson Street Railway Company, 68 Atlantic Reporter, 158.—The court of errors and appeals of New Jersey says that the plaintiff was a passenger on a closed trolley car with a high winter door on each side, extending from the platform to the top of the car. He stood on the rear platform. The car was running in an eastwardly direction in a street where there were parallel tracks. As the car was coming to a stop to let off some passengers, the conductor opened the door on the north side of the car, and in some manner the plaintiff fell off.

In affirming a judgment for the defendant, the court holds that a passenger standing upon the rear platform of a trolley car has no right to rely, in preserving his equilibrium, upon the protection of the closed door, and it is not the duty of the conductor to warn him before opening the door, suddenly, when it appears from the evidence that the passenger was not leaning against the door, and was not in such a position that the opening of the door required him to move or in any way interefered with him. Therefore a request to charge the jury that "a carrier owes to its passengers a high degree of care and the plaintiff in preserving his equilibrium had a right to rely upon the protection of the closed door, and it was the duty of the conductor to warn the plaintiff before opening the door suddenly," was properly refused, especially when it was reasonably to have been inferred from the evidence that there was room for the passenger inside the car.

Again, the court holds that when it does not appear that the door was maintained for the purpose of assisting passengers in preserving their equilibrium, but rather that one of its purposes was to allow ingress and egress of passengers, it was not negligence to open the door on the north side of the car to enable passengers to alight unless it was a dangerous place for passengers to get down. Therefore an instruction that "it might be a question whether the conductor would be negligent in opening the door on that side, unless it was in a place where it would be dangerous for passengers to get down; that would be the only reason that would make it negligent to do it at all"—was not erroneous, especially when the evidence was most persuasive, if, indeed, it did not compel the conclusion, that the place where the north door was opened was a safe place to alight, and that it would have been, on account of the snow, unsafe to have let the passengers out on the other side.

While it is not negligence per se (by itself) for a passenger to ride upon the platform of an electric street railway car, nevertheless a passenger who voluntarily rides upon the platform when there is room for him inside the car takes upon himself the duty of looking out for, and of protecting himself against, the usual and obvious perils attendant upon his position, such as the danger of being thrown from the platform by the ordinary jolting and swinging of the car.

It is announced that the Washington Baltimore & Annapolis Electric Railway will begin regular operation early in April on its line between Washington and Baltimore and on the branch to Annapolis. On the main line a 15-minute headway will be maintained.

News of the Week

Educating the Public by Bulletins.

"From Coal Pile to Car Wheel" is the title of Bulletin No. 6 of the series which the United Railways & Electric Company of Baltimore is publishing in the daily newspapers of that city in order to promote a clearer understanding of the company's business by the public. This bulletin describes briefly, in non-technical language, the methods by which the electrical current is generated and distributed and explains carefully the various steps in its course through transmission lines, substations, feeders and trolley wires before reaching the car motors.

To give an idea of the intricacy and extent of the power system it is explained that 780 miles of cable are necessary for the transmission and distribution of the current, in addition to over 400 miles of trolley wires and connections and the great amount of complicated machinery at the power houses.

The concluding paragraph is as follows:

"When you consider that the car service is interrupted in some sections of the city by a mishap to any one of these complicated parts, from the coil-hoisting buckets to the wiring and the motors in the cars, then you can form an estimate of the great care that has to be taken in the operation and maintenance of such a vast electric system."

Transit Affairs in New York.

The forms of contract for the Brooklyn Fourth avenue subway were considered by the board of estimate and apportionment on March 20. The route, as laid out by the public service commission, extends from the Brooklyn terminal of the Manhattan bridge to Forty-third street, Brooklyn, and is divided into six sections. The matter was finally referred to a select committee, consisting of the comptroller, the corporation counsel and the chief engineer of the board, for the purpose of determining whether it would not be better, if the finances of the city will permit, to approve the forms of contract for only three of the six sections, providing for the construction of the route from Nassau street to Sackett street. The estimated cost of the entire route is about $20,000,000. At a meeting on Monday of this week the committee decided to report in favor of letting contracts at once for the first two sections, extending as far as Flatbush avenue.

Justice Davis of the New York supreme court on March 16 sustained a claim for damages against the Manhattan Elevated Railway brought by property owners on account of the construction of a third track on the elevated structure in 1897 without their consent. The court awarded damages of $30,000 and a rental charge of $1,800 a year for six years. The company claimed that as the elevated structure had been in existence since 1880 and had been in continuous use for over 20 years prior to the bringing of the action in 1902, it had acquired an absolute right by prescription to the use of the structure. The court held, however, that as only two tracks were included in the original grant, the building of the third track in 1897 constituted an effective interruption of the original user and defeated the claim of prescriptive right.

F. L. Fuller, president of the New York & Queens County Railway, has announced that plans have been drawn for a connection of the company's tracks with the Blackwell's Island bridge, and that it is proposed to carry passengers from the Manhattan terminal of the bridge to all parts of the borough of Queens for a 5-cent fare.

Pay-As-You-Enter Cars in New York a Success.

The 155 pay-as-you-enter cars that were put in operation on Sunday, March 21, on the Madison avenue line of the New York City Railway have been pronounced an unqualified success by the company and have thus far met with the full co-operation of the public, although many had doubted the feasibility of adopting a service that would entail a delay in the seating of passengers. The situation was even more complex than in Chicago, where this type of equipment was first operated in the United States, owing to the fact that the people in New York City view a street railway corporation a little more critically than is usual elsewhere. In anticipation of possible difficulty in enforcing the new rules incidental to the operation of the pay-as-you-enter car the company stationed lawyers in a number of the courts in East Manhattan throughout the first day of operation to defend any of the employes who might be arrested for enforcing the rules. No disagreements occurred, however, that the conductors were not able to cope with.

On Monday, March 22, a very severe test of the new cars was experienced. During the evening rush hours, between 4 and 6 o'clock, the usual difficulty in handling the crowds was enhanced by a rainstorm, yet there was practically no delay in the movement of the cars. The fact that a passenger could obtain shelter from the rain by stepping onto the platform as soon as the car had stopped, instead of waiting for passengers to alight, doubtless tended to produce a favorable impression of the pay-as-you-enter feature. Another advantage was that the cars seldom stopped longer than was necessary to allow passengers to get on or off, thus reducing the running time. At the Grand Central station, Fifty-ninth street and the Brooklyn bridge terminal inspectors had been stationed to aid the conductors in handling the crowds. It was found that this was hardly necessary except at the Brooklyn bridge. At this point the motorman changes to the other end of the car and the doors are arranged preparatory to taking on the uptown traffic. While this was being done spectators crowded around the entrance of the car in sufficient numbers to interfere with the passengers who wished to board, so that few could get on before the conductor had given the signal to start. This temporary inconvenience will, of course, abate as soon as the curiosity of the public is satisfied.

The New York City Railway has adopted three new rules for the pay-as-you-enter cars which have not been attempted elsewhere. No more than 50 passengers are allowed to board the cars at terminals, no more than 75 passengers are permitted to be carried at one time, and smoking on the front platform is prohibited. In a few days, as soon as the public has become accustomed to paying fares on the platform, nickel-in-the-slot fare boxes will be installed. The Tec automatic fare register, which was described in the Electric Railway Review of January 4, page 32, is the type adopted.

Oren Root, Jr., general manager for the receivers of the New York City Railway, expressed his opinion of the new cars after the first day's operation as follows: "The operation of the pay-as-you-enter cars has proved an unqualified success. The commendation of the cars by the passengers, so far as I have been able to learn, has been universal. What has been claimed for these cars has been actually demonstrated. Two features of the day's operations are especially worthy of mention. First, the ease and pleasure with which the public grasped the new conditions, and second, the rapidity and lack of friction with which the people were handled at congested points. The possible criticism is the height of the steps, which I have arranged with our engineer to modify as rapidly as possible, so that they will be approximately the same height as those on the present equipment."

Progress of the Cleveland Settlement Negotiations.

The representatives of the city of Cleveland and of the Cleveland Electric Railway have been engaged for several days in efforts to determine the final plans for the reorganization of the street railways. Aside from the valuation of the property, which has not yet been agreed upon, the principal points to be settled are the terms of the lease to a holding company, the plan of organization of the holding company and the terms of the security franchise. F. H. Goff and Mayor Johnson are acting as a committee on organization; Mayor Johnson, City Solicitor Baker and Secretary Davies of the Cleveland Electric Railway as a committee on the security grant; and Attorneys Westenhaver and Crawford as a committee on lease.

The tentative form of the security franchise which is to be granted to the Cleveland Electric Railway as a protection to the stockholders in case the holding company, which is to operate the lines after the settlement, should prove a failure, was published on Tuesday of this week. The ordinance provides for a new 25-year franchise, covering the entire Cleveland Electric system, in return for a surrender of the present franchises. After the settlement the security franchise is to be introduced into the city council by Robert Koch, chairman of the street railway committee, and when passed it is to be held in escrow by a trust company until the lease of the property to a holding company becomes operative. The ordinance provides for a 5-cent cash fare, with universal transfers, but the amount of the ticket fare is yet to be determined. The tracks in the downtown district are to be used jointly by another company at the discretion of the council. The right of purchase by the city at the end of the grant is reserved, provided the city has the power. The price may be agreed upon or may be fixed by arbitration at the cost of reproduction less depreciation, plus 10 per cent. The franchise is revocable in case its provisions are not complied with.

It has not yet been determined whether the Cleveland Electric Railway shall take over the Forest City Railway before the lease to the holding company, although it is understood that the two companies will be consolidated. Mayor Johnson has announced that the holding company will probably be called the "Cleveland Street Railway." It is understood that the holding company is to operate under the terms

of the security franchise, but at a rate of fare less than five cents, which will permit a return of 6 per cent on the investment. The plan of organization cannot be settled definitely until the stockholders' meetings of both companies are held. That of the Forest City Railway has been called for March 28 and that of the Cleveland Electric Railway for April 6.

The question of price is still to be determined. Mayor Johnson's estimate is $41.75 per share for the stock after deducting indebtedness; Mr. Goff's latest offer is about $12 higher, with additional claims for outlying franchises and good will. Mr. Davies has submitted an estimate of $71 per share.

The personnel of the board of directors of the new company has been generally discussed in a tentative way and it has been suggested that both Mr. Goff and Mr. Johnson should be members. Mr. Goff, however, has announced that he would not accept.

The city council, at its meeting on Monday night, passed a resolution authorizing the board of public service to reconstruct the tracks on Central avenue and Quincy street in accordance with a suggested plan that the money should be borrowed from the Cleveland Electric Railway and the Forest City Railway, each company to operate one line. The Forest City Railway offered to lend the money for all or part of the work. The Cleveland Electric Railway has taken the matter under consideration.

Legislation Affecting Electric Railways.

Massachusetts.—The committee on street railways has reported to the house a bill providing that cities of over 75,000 inhabitants may grant street railways the right to carry freight by a two-thirds vote of the aldermen and the approval of the mayor.

New Jersey.—The house has passed the Martin bill, which provides for the establishment of a state public service commission similar to the New York commissions.

New York.—Assemblyman Wagner has introduced a bill amending the rapid transit act so as to give the public service commission for the first district power to acquire by purchase, with the approval of the board of estimate and apportionment, railways already constructed or in process of construction. Upon obtaining the required consents the public service commission may, with the approval of the board of estimate, enter into a contract for the equipment, maintenance and operation of the roads for a term of years, to be specified in the contract, not to exceed 25 years, with the privilege of a renewal for a like period.—Senator Frawley has also introduced a bill authorizing the city to purchase railways, providing that the city authorities shall make an agreement as to price with the owners. No provision is made for condemnation proceedings.—Comptroller Metz and John E. Eustis of the public service commission of the first district appeared before the judiciary committee on March 24 to advocate an amendment to the Elsberg law which will permit the construction of subways by private capital, also a bill to exclude bond issues for subway and dock construction from the constitutional debt limit.

Ohio.—Senator Lamb has introduced a bill conferring on the state railroad commission authority to require the installation of safety appliances at all crossings of steam and electric railways.—The senate has passed the Huffman bill, which requires interurban railways to equip their passenger cars with toilet rooms and provides a fixed fine per day for cars operated in violation of the law.

Canadian Electrical Association.—It has been decided to hold the annual convention of the Canadian Electrical Association this year at Toronto, Ont., on June 10, 11 and 12.

Ordered to Remove Crossings with Steam Road.—The Pennsylvania & Maryland Street Railway, operating between Meyersdale and Salisbury, Pa., has been ordered by the court to remove its rails and frogs from the tracks of the Baltimore & Ohio Railroad at three points where the lines intersect.

Cars Must Stop at Crossings.—The city council of Newcastle, Ind., has passed an ordinance requiring the Terre Haute Indianapolis & Eastern Traction Company to stop both local and limited cars at all street crossings when signaled by intending passengers. A penalty of $10 is provided for violation of the ordinance.

Attempt to Wreck Interurban Car.—An attempt was made on the night of March 23 to wreck an interurban car of the Boston & Northern Street Railway near Saugus, Mass. The motorman discovered a pile of fence timbers and other debris on the track just in time to prevent an accident. Two men who are suspected have been arrested.

American Institute of Electrical Engineers, Worcester Branch.—At a meeting of the Worcester Polytechnic Institute branch of the society, held in the Electrical Engineering building, Worcester, Mass., on Friday evening, March 27, Dr. Charles P. Steinmetz, consulting engineer the General Electric Company, delivered an address on "Electrical Conduction."

Proposed Snow Removal Contract for Montreal.—The Montreal Street Railway has submitted to the city council an offer to make a 10-year contract with the city under which the company agrees to remove the snow from the streets occupied by its tracks at a maximum cost of $3,000 per year per mile, half the cost to be paid by the city, provided the city would provide dumping grounds.

Not Required to Erect Shelter Stations.—The Massachusetts railroad commission has declined to grant a petition of residents of Wellesley, Mass., that the Boston & Worcester Street Railway be required to erect two shelter stations on Worcester street, stating that only traffic conditions are a basis for requiring waiting stations. The commission suggests that the town furnish land and erect the shelters, on condition that the company light, heat and maintain them.

Tax Case Before Supreme Court.—The case of the city of St. Louis against the United Railways Company of St. Louis, involving the right of the city to impose a tax of one mill for each passenger carried, in addition to the usual car license fees, was argued before the United States supreme court this week. H. S. Priest represented the company. The federal court at St. Louis decided in favor of the company about two years ago, granting an injunction restraining the city from imposing the tax.

Annual Convention Oklahoma Electric Light Railway and Gas Association.—Announcement has been issued from the office of President F. H. Tidnam stating that the second annual meeting of the Oklahoma Electric Light Railway and Gas Association will be held at Guthrie, Okla., on May 25, 26 and 27, 1908. An exhibit of electric and gas appliances, the power for which will be furnished free to exhibitors, will form an interesting feature of the convention. An announcement of the programme will be made later.

American Institute of Electrical Engineers Nominations.—The board of directors of the American Institute of Electrical Engineers has selected the following nominees for the forthcoming annual election: President, L. A. Ferguson, Chicago; vice-presidents, C. C. Chesney, Pittsfield; Calvert Townley, New Haven; Bancroft Gherardi, New York; managers, D. B. Rushmore, Schenectady; H. E. Clifford, Boston; W. G. Carlton, New York; C. A. Stone, Schenectady; treasurer, G. A. Hamilton, New York; secretary, Ralph W. Pope, New York.

Indiana Rules Practically Finished.—The committees which have been formulating train operation and maintenance of way rules for interurban railways of Indiana at the suggestion of the railroad commission of that state held a joint meeting at the state house, Indianapolis, on March 25. It has been decided to combine the rules in one book. The work of the committees has been practically finished. Copies of the rules which have been prepared will be sent to the various companies for consideration, and a short time later a conference will be called at the state house at which the rules will be discussed. As stated in the account of the meeting of the Central Electric Railway Association in another part of this issue, that organization took action concerning the rules.

Western Society of Engineers.—At a meeting of the Western Society of Engineers on Wednesday evening of this week, J. N. Darling, principal assistant engineer of the South Side Elevated Railroad, Chicago, presented a paper on "Some Features of the Construction of the South Side Elevated Railroad," which was illustrated by lantern slides. Mr. Darling outlined the recent construction and extension work of the South Side road and described in detail some of the difficult features of the reconstruction and third-tracking of the line between Twelfth and Forty-third streets. This work was described and illustrated in the Electric Railway Review of August 31, 1907, page 251. At the meeting on April 1 in the society rooms in the Monadnock block, Chicago, William M. Torrance will present a paper on "Reinforced Concrete Structures in the Hudson River Tunnel Work."

Charter Forfeiture Suit Concerning New York City Railway.—Paul D. Cravath, attorney for the New York City Railway and H. R. Limburg, special counsel for the attorney-general in the action brought to forfeit the charter of the company, have entered into a stipulation concerning the stock of the Twenty-eighth and Twenty-ninth Streets Crosstown Railroad. The agreement eliminates $750,000 in the assets reported by the New York City Railway in the trial of the suit before Justice Davis of the New York supreme court. The stipulation says: "The lines of this company are entirely operated

by horse cars, and it has not thus far earned amounts sufficient to pay the interest on its funded debt, which interest has been paid by the New York City Railway in part. The deficit of this company for the year ended June 30, 1906, was $51,819.78, after charging said interest. Total receipts from operation for that period were $160,736.80. The above deficit does not include special franchise taxes in litigation. No dividends have at any time been declared on the stock of this company, and there have been no transactions in this company's stock. For the purposes of this trial it is stipulated that the stock of this company represents no actual cash investment, and has up to the present time had no market value."

DIRECTORY OF ELECTRIC RAILWAY ASSOCIATIONS.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 29 West Thirty-ninth street, New York.

American Street and Interurban Railway Accountants' Association. Secretary, Elmer M. White, 29 West Thirty-ninth street, New York.

American Street and Interurban Railway Claim Agents' Association. Secretary, B. B. Davis, claim adjuster Columbus Railway & Light Company, Columbus, O.

American Street and Interurban Railway Engineering Association. Secretary, J. W. Corning, electrical engineer Boston Elevated Railway, Boston, Mass.

American Street and Interurban Railway Manufacturers' Association. Secretary, George Keegan, 2321 Park Row building, New York, N. Y.

American Street and Interurban Railway Transportation and Traffic Association. Secretary, Bernard V. Swenson, 29 West Thirty-ninth street, New York.

California Electric Railway Association. Secretary, L. E. W. Pioda, Oak and Broderick streets, San Francisco, Cal.

Canadian Street Railway Association. Secretary, Acton Burrows, 157 Bay street, Toronto, Ont.

Central Electric Railway Association. Secretary, A. L. Neereamer, Indianapolis, Ind.

Central Electric Traffic Association. Chairman, A. L. Neereamer, Indianapolis, Ind.

Colorado Electric Light Power and Railway Association. Secretary, John F. Dostal, Denver Gas & Electric Company, Denver, Colo.

Electric Railway Shop Foremen's Association. Secretary, W. D. Bower, Public Service Corporation of New Jersey, Elizabeth, N. J.

Iowa Street and Interurban Railway Association. Secretary, L. D. Mathes, general manager Union Electric Company, Dubuque, Ia. Annual meeting Des Moines, Ia., April 23 and 24, 1908.

Massachusetts Street Railway Association. Secretary, Charles S. Clark, 70 Kilby street, Boston, Mass. Meetings held in Boston on second Wednesday of each month, except July and August.

Michigan Electrical Association. Secretary, A. C. Marshall, Port Huron, Mich.

Missouri Electric Light Gas and Street Railway Association. Secretary, Charles Z. Pierson, St. Charles Electric Light & Power Company, St. Charles, Mo. Annual meeting St. Louis, Mo., April 23, 24 and 25.

National Amusement Park Association. Secretary, C. H. Oberheide, Trenton, N. J. Annual meetings third Tuesday of each November.

New England Street Railway Club. Secretary, John J Lane, 12 Pearl street, Boston, Mass. Meetings held on fourth Thursday of every month, Boston, Mass.

Northwestern Electrical Association. Secretary, Roger N. Kimball, Kenosha, Wis.

Oklahoma Electric Light Railway and Gas Association Secretary, Galen Crow, Guthrie, Okla. Annual convention, May 25, 26 and 27, Guthrie, Okla.

Pennsylvania Street Railway Association. Secretary, Charles H. Smith, superintendent Lebanon Valley Street Railway, Lebanon, Pa.

Southwestern Electrical and Gas Association. Secretary, R. B. Stichter, Dallas, Tex. Annual meeting May 7, 8 and 9, El Paso, Tex.

Street Railway Association of the State of New York Secretary, J. H. Pardee, 611 West One Hundred and Thirty-seventh street, New York N. Y. Annual meeting June 23 and 24, Niagara Falls, Ont.

Wisconsin Electric and Interurban Railway Association Secretary, Clement C. Smith, president Columbia Construction Company, Milwaukee, Wis.

The electrified line of the Ohio Electric Railway between Lima and Defiance, O., formerly the Columbus & Lake Michigan steam road, will be put in operation about June 1.

Traffic and Transportation

Contest for Trademark Design.

The Cleveland Painesville & Eastern Railroad, Willoughby, O., has announced a contest for a design for a trademark. A prize of $25 will be awarded for the most satisfactory design, which is to be selected by a committee of newspaper men. A circular signed by J. Jordan, the general manager, states that sketches must be on blank paper 8 by 11 inches, and that the designs should not be less than 6 by 8 inches. A number or initial should be inclosed in a sealed letter with each sketch as a means of identification after the contest is closed and the prize is awarded. All sketches and designs are to become the property of the railroad company The name or initials of the company must be incorporated in the design.

Sketches will be received until May 1, 1908, by E. L. Schmock, assistant secretary and treasurer, Willoughby, O.

Interchange and Joint Rates Ordered.

The interstate commerce commission, in a recent opinion rendered by Commissioner Harlan, announced its decision in the case of the Cedar Rapids & Iowa City Railway Company against the Chicago & Northwestern Railway Company.

This is a case where the commission ordered through routes and joint rates to be established between an electric railway company and a steam railroad company. It appeared on complaint of failure by the steam railroad company to establish through routes and joint rates with the electric line between interstate points on their respective roads, that the shipping communities at points on the electric line between Coralville, Ia., and Cedar Rapids, Ia., do not at this time enjoy the benefit of any reasonable or satisfactory through route from and to Chicago and other points reached by the defendant steam railroad company.

The commission held that through routes and joint rates thereover which shall not exceed by more than 10 per cent the class and commodity rates of defendant between Chicago and common points and Cedar Rapids, should be established and maintained for the transportation of interstate traffic from and to Coralville and on all other points on the electric line intermediate to Cedar Rapids to and from Chicago and other points on the line of the steam railroad via junction point of the two roads at Cedar Rapids.

A former decision of the commission in regard to the Chicago & Milwaukee Electric Railroad (Electric Railway Review, January 4, 1908, page 24) was cited and affirmed and the distinction made between the transportation requirements of mere loading points serving one or more farms, as described in that case, and the more extensive requirements of small centers where general merchandising is done and the products of the countryside are concentrated for shipment, and coal, lumber and other commodities are brought in to supply local needs.

Advance in Fares.—The Portsmouth & Exeter Street Railway, Portsmouth, N. H., will advance fares to eight cents commencing on April 1. The reason given is that the company has accumulated a floating indebtedness of $41,000 in the last five years.

Illinois Tunnel Company.—A circular issued by J. B. Russell & Co. of New York in relation to the property states that the following connections have been finished with railways: Atchison Topeka & Santa Fe, 2 in and 2 out bound; Baltimore & Ohio, 2 in and 2 out bound; Chicago & Alton, 1 in and 1 out bound; Chicago Burlington & Quincy, 4 in and 1 out bound, Chicago & Erie, 1 in and 1 out bound; Chicago & Eastern Illinois, 2 in and 1 out bound; Chicago Great Western, 1 inbound; Chicago Milwaukee & St. Paul, 1 in and 1 out bound; Chicago Indianapolis & Louisville, 1 in and 1 out bound; Chicago & Northwestern, 2 in and 2 out bound; Chicago Rock Island & Pacific, 1 in and 1 out bound; Illinois Central, 2 in and 2 out bound; Lake Shore & Michigan Southern, 1 in and 1 out bound; Michigan Central, 4 in and 2 out bound; New York Chicago & St. Louis, 1 inbound; Pittsburg Cincinnati Chicago & St. Louis, 2 in and 2 out bound; Pittsburg Ft. Wayne & Chicago, 2 in and 2 out bound; Wabash, 2 in and 2 out bound; Wisconsin Central, 1. The circular adds: "The connections made with the six passenger terminals gave the company an opportunity to accept a contract from the government to handle United States mails to and from the stations and the postoffice, as well as the through mails east and west, which are transferred from station to station. This tonnage has averaged a little over 1,000 cars per day, the handling of which is recognized to have been practically perfect."

Construction News

FRANCHISES.

Bellefontaine, O.—The city council has granted the Ohio Electric Railway a 20-year franchise for an entrance to the city for its Lima-Bellefontaine line.

Birmingham, Ala.—The Birmingham Railway Light & Power Company has been granted an extension of one year in which to build proposed street railways on various streets in Birmingham.

Chicago, Ill.—The South Side Suburban Railway has applied for a 50-year franchise for an electric railway from Chicago Heights to a connection with the South Side Elevated Railroad at Sixty-third street and South Park avenue, Chicago, through Thornton, Dolton, Fernwood, Roseland and West Pullman. Between Seventy-fifth and Sixty-third streets the road is to be elevated. The road will occupy a private right of way; the franchise is asked to permit the crossing of streets and alleys. C. C. Heisen, S. A. Foster and Cornelius J. Ton are interested.

Dallas, Tex.—The Dallas Interurban Electric Railway Company has asked for an extension of two years in which to begin work on the construction of its proposed system of local and interurban lines. The present franchise expires on April 1, 1908. Under the new franchise the company must have 30 miles of track laid by December, 1910. The company was incorporated by local men several months ago to build 30 miles of street railway in Dallas and interurban lines from Dallas to Sherman, Denison, Greenville, Terrell and Tyler, Tex. A portion of the right of way has been secured and preliminary surveys made. Henry Dorsey, president, Dallas, Tex. (Noted February 22.)

Klamath Falls, Ore.—W. H. Mason, representing the Inland Electric Company, has applied for a franchise to build an electric railway from the eastern city limits of Klamath Falls to the terminus of the Klamath Falls Land & Transportation Company's line at Morrill, Ore., 25 miles.

Mineola, N. Y.—The South Shore Traction Company, Patchogue, N. Y., has received an extension of one year in which to complete the construction of its line through Nassau county.

North Adams, Mass.—The Berkshire Street Railway has presented five petitions to the North Adams common council asking permission to extend its lines in the city. The company desires to build two stretches of track serving the north section of the city, to double-track Main street, to build a new route for freight carrying purposes on the north side of the city and to build a line down River street for the same purpose. A hearing will be given on April 7, and there is said to be little doubt but that all the petitions will be granted.

Ogden, Utah.—The Ogden Rapid Transit Company has applied for a franchise to lay its tracks in Wall avenue, agreeing to have the line in operation within a year.

Shreveport, La.—John Lorenz, president of the recently incorporated Shreveport Suburban Railway, which will be built from Shreveport, La., to Marshall, Tex., has been granted a franchise in Shreveport. (Noted February 29.)

Springfield, Ill.—The Springfield Consolidated Street Railway has applied for a new franchise in place of its present franchises, which expire at different times, and has agreed to build the Eighth street subway, which the city desires, in return.

South Bend, Ind.—The Indianapolis Logansport & South Bend Traction Company has petitioned the county commissioners of St. Joseph county for a franchise to operate over the Michigan road instead of paralleling the Vandalia line. S. S. Perley, South Bend, Ind., is president. (Noted October 26, 1907.)

Toledo, O.—The city council has defeated an ordinance granting a 6-year franchise to the Toledo Fostoria & Findlay Railway for its entrance to the city. The franchise was for a distance of but two blocks, and as the company owns the right of way the grant applied only to two street crossings.

Washington, D. C.—The house has passed a bill extending for 12 months the time allowed the East Washington Heights Traction Company in which to begin construction of its line.

Wenatchee, Wash.—The Seattle Electric Company has applied for a franchise for an electric railway on Wenatchee avenue. It is stated that a line from Wenatchee to Leavenworth is contemplated.

RECENT INCORPORATIONS.

Cherokee Belt & Interurban Railway, Tulsa, Okla.—Incorporated in Oklahoma to build an electric railway from a point on the Midland Valley Railroad to a connection with the Missouri Kansas & Texas Railway, serving Collinsville and other points in northeastern Oklahoma and passing through the counties of Craig, Tulsa, Rogers and Myers. Capital stock, $500,000. Incorporators: F. E. Montee, Kansas City, Mo.; C. W. Butterworth, Tulsa; J. R. Caudley, E. Pease and A. E. Leahe, Collinsville, Okla.

Gallatin Valley Electric Railway.—Incorporated in Montana to build an electric railway 26 miles long, from Bozeman, Mont., to points in the farming districts of that section. Incorporators: W. S. Hartman and C. D. Hartman, Bozeman, Mont.; and C. H. Winfree, Spokane, Wash.

Goose Creek Railway & Power Company, Jesup, Ga.—Incorporated in Georgia to build an electric railway and power plant. Capital stock, $300,000. Incorporators: D. M. Clark, Jesup, Ga.; D. G. Zeigler, Columbia, S. C., and others. (Noted February 15.)

Rural Electric Railway & Power Company.—A bill has been introduced in the Maryland senate incorporating this company to build an electric railway from Lauraville, Md., to the Falls road at or near Belvidere avenue, and from Baltimore to Sparrows Point by way of the North Point road, with extensions as desired. Capital stock, $500,000. Incorporators: Hugh J. Gallagher, Walter & Kephart, W. T. Dietrick, Dr. Harry C. Hess, Robert W. Mowbray and Jacob S. Parr.

Short Line Terminal Company, Baltimore, Md.—This company has applied to the Maryland legislature for a charter to build an independent terminal line in Baltimore for the Baltimore & Annapolis Short Line, which is owned by the Maryland Electric Railways Company. Construction is said to have been started from Clifford station to the city. Incorporators: John Wilson Brown, Baltimore; Shellman B. Brown, Arthur D. Foster, Daniel R. Radall, J. Winfield Henry.

TRACK AND ROADWAY.

Albany (Ore.) Street Railway.—It is announced that this company's 4-mile horse car line will be converted for electrical operation within 60 days. Work has already been started. Power will be purchased. J. E. Ross, general manager.

Albia (Ia.) Interurban Railway.—This company is reported to be in the market for rails, ties and trolley wire for the construction of a half-mile extension. J. P. Reese, president, Albia, Ia. (Noted January 11.)

Augusta & Columbia Railway, Augusta, Ga.—Construction work on this line, which will afford connection with Aiken and Columbia, S. C., was started last week at a point just beyond the North Augusta bridge. A contract for a portion of the construction work has been awarded and it is understood that a large force of men will be added to the force now at work and construction pushed as rapidly as possible. James U. Jackson, Augusta, Ga., president. (Noted March 14.)

Berlin & Bridgeport Electric Street Railway.—During the present year this line will probably be extended through Bloomingdale, New Germany, Conestoga, Winterbourne and West Montrose, connecting with the Guelph & Goderich Railway.

Boston Elevated Railway.—Construction work has been started on the elevated car storage yard near Forest Hills. The yard will be located on private land owned by the company at the intersection of Washington street and the Arborway, and the lead tracks of the yard will be extended from Washington street in a double line for a distance of about 1,000 feet. The land provides for the construction of storage tracks 500 feet long, if necessary, and the property is extensive enough to care for the extra cars required by the business anticipated for the Forest Hills extension of the elevated structure. In connection with the completion of the main line structure, which now ends at a point about 150 feet short of the Arborway, excavations have been made for the foundation posts needed in the connection with the terminal and storage yard. At Dudley street the extra spans of steel to support the new third track have been placed in position. This extra track will be used for handling trains in and out of the Guild street car house after the two main tracks have been turned over to the Forest Hills service. Steel for platforms, passages and stairways at the Eggleston square station is now in place.

Brantford & Hamilton Electric Railway, Hamilton, Ont.—The line between Brantford and Hamilton is now practically completed and it is expected that it will be in operation before the end of May. W. C. Hawkins, general manager.

Charlotte Electric Railway Light & Power Company, Charlotte, N. C.—Announcement is made that a 1½-mile extension of this company's line will be built through Belmont, N. C., by the Charlotte Consolidated Construction Company.

Connecticut Company, New Haven, Conn.—It is stated that work will be resumed this week on the Stafford-Rockville electrified division of this company's lines and that it will be ready for operation in May. The most important work remaining to be done is the completion of the bridge at Stafford Springs and the leveling of the tracks in Rockville. It is understood that through cars will operate from Stafford to Hartford, using the tracks of the Hartford Manchester & Rockville Tramway Company from Rockville.

Decatur, Ind.—M. M. Lacey, Fountain City, Ind., is said to be interested in a project to build an electric railway between Decatur and Richmond, Ind.

Hattiesburg (Miss.) Traction Company.—Negotiations are said to have been closed by this company for a $300,000 bond sale, the proceeds of which will be applied toward the extension of its street railway from the business to the residence district, and for the construction of a large power plant. C. Z. Stephens, general manager, Hattiesburg. (Noted August 3, 1907.)

Illinois Traction System, Champaign, Ill.—L. E. Fischer, general manager, has announced that the line from Springfield to Jacksonville, Ill., on which considerable grading was completed last year, will not be built this year, because of the financial situation.

Interurban Construction Company, Denver, Colo.—It is reported that this company has made financial arrangements for beginning the construction of its line from Denver to Greeley, Colo. Surveys have been made and much of the right of way has been obtained. The main line parallels the Platte river the entire distance. Construction is to begin at once on a branch line from Ft. Lupton to Longmont, passing through a coal field in which the power house will be located, at Firestone. It is proposed to begin construction on the main line by June 1.

Missouri & Kansas Interurban Railway, Kansas City, Mo.—W. B. Strang of the Strang Gas-Electric Car Company, New York, has announced that this line from Kansas City, Mo., to Olathe, Kan., 22 miles, will be converted for electrical operation. The road is now operated by Strang gasoline-electric cars, which will still be used to furnish an auxiliary service.

Morrisburg (Ont.) Electric Railway.—This company is planning the construction of an electric railway from Morrisburg, through Williamsburg, Winchester, Chesterville and Morewood to Russell, with a branch line to Winchester village, and an application is to be made to the Ontario legislature for a charter. I. Hilliard of Morrisburg, Ont., is acting for the applicants.

Nashville Interurban Railroad, Nashville, Tenn.—President H. H. Mayberry has announced that construction work on the electric railway to Mt. Pleasant, Tenn., which was suspended in January, will be resumed the first week in April. (Noted January 18.)

Omaha & Council Bluffs Street Railway, Omaha, Neb.—Surveys are now being made over several routes for the proposed extension to the Iowa School for the Deaf.

Pacific Electric Railway, Los Angeles, Cal.—The overhead construction is now being erected on the line between Riverside and Crestmore, Cal. Grading is also in progress on the line from Riverside to Colton. Garney & Pitter are the contractors.

Pana Girard & Jacksonville Railway.—This company has been organized to build an electric railway from Pana to Jacksonville by way of Girard, Ill. B. F. Darnielle, J. M. Anderson, W. F. Bercher, Springfield, Ill.; John J. Stowe, Girard; Charles E. Sargent, Greenfield, Ill., are interested.

Pittsburg Harmony Butler & New Castle Street Railway, Pittsburg, Pa.—Orders have been issued to the construction forces to work night and day in order to complete the line between New Castle and Harmony by June 1. The track has been laid, the poles have been erected and the power house at Eidenau is already in operation, furnishing power for lighting. Owing to the destruction by floods of the false work for the bridge at Ellwood City the section from Harmony to Pittsburg will not be completed until about the middle of summer. James Bryan, chief engineer, Pittsburg.

Pittsburg, Pa.—Robert A. Carter, president of the Carter Iron Company, is interesting the Pittsburg chamber of commerce in a plan to build elevated railway tracks on the Smithfield street bridge and to construct a loop system of elevated lines in the downtown district.

St. Matthews, S. C.—An electric railway from St. Matthews, S. C., to the Congaree river is being promoted by D. G. Zeigler & Co. of Columbia, S. C., and Atlanta, Ga., engineers. A. R. Able, J. A. Banks, J. S. Wannamaker and others of St. Matthews are interested.

Salt Lake & Ogden Railway, Salt Lake City, Utah.—It is stated that this company will have its line ready for electrical operation in time to care for the summer tourist business. Until the company builds a plant of its own power will be purchased from one of the independent companies in Salt Lake. From the terminus of the road at Lincoln and Twenty-fifth streets the company will operate an automobile line to Ogden canyon, a summer resort. Simon Bamberger, president, Salt Lake City.

Seattle (Wash.) Electric Company.—In regard to recent reports that this company proposed to make extensive improvements and extensions, H. F. Grant, manager, advises us that the company is not contemplating any extensions, improvements or additions to the system during 1908, owing to the stringent financial conditions prevailing.

Taylorville, Ill.—W. B. Adams of Taylorville is said to be interested in the construction of an interurban line from Mt. Auburn to Taylorville, Ill. Residents along the proposed route are asked to subscribe $5,000 for the preliminary work.

Taylorville Street Railway Light Heat & Power Company, Taylorville, Ill.—This company has been organized to build an electric railway and power plant in Taylorville, Ill. I. J. Perkins, Albert Morgan, J. A. Adams and others are interested.

Texas Traction Company, Dallas, Tex.—President J. F. Strickland has recently issued a statement in regard to the progress of the road between Dallas and Sherman, Tex., in which he states that the road will probably be in operation in June. The grading is practically completed, the bridge and trestle work is nearly finished, 32 miles of track have been laid and 25 miles of poles have been erected. All of the rails have been delivered and much of the material for the overhead work. Most of the equipment has been installed in the power house at McKinney and the four substations will be completed early in April. F. A. Jones, chief engineer. (Noted March 14.)

Washington Railway & Electric Company, Washington, D. C.—A bill has been introduced in the house of representatives authorizing this company to lay a double-track extension serving the section between Fourteenth street on the east and Connecticut avenue on the west in Washington, D. C., the extension to be completed within a year.

Waterloo Cedar Falls & Northern Railway, Waterloo, Ia.—It is stated that this company expects to extend its lines to Westfield and other outlying districts of the city, connecting them with the business district and completing a loop between the west side loop and the Cedar Falls line on the north. The improvements will cost about $75,000. C. D. Cass, general manager, Waterloo. (Noted February 22.)

Windsor Essex & Lake Shore Rapid Railway, Windsor, Ont.—W. C. Crawford, first vice-president, states that the extension from Kingsville to Leamington, Ont., 10 miles, will be ready for operation about April 15. It is proposed to extend the line an additional 20 miles to Tilbury during the present year under the charter of the Windsor Chatham & London Railway and to ultimately extend the line to Chatham.

Youngstown & Ohio River Railroad, Youngstown, O.—Construction has been started on the 6-mile line between East Liverpool and West Point, O., which will complete the line from Youngstown to East Liverpool.

POWER HOUSES AND SUBSTATIONS.

Hattiesburg (Miss.) Traction Company.—Announcement is made that this company has completed plans for the construction of a power plant to furnish power for the operation of its proposed street railway system in Hattiesburg. C. Z. Stephens, general manager. (Noted August 3, 1907.)

Nashville (Tenn.) Railway & Light Company.—A new 3,000-kilowatt turbo-generator has recently been installed.

Ohio Electric Railway, Cincinnati, O.—Rapid progress is now being made on the construction of a combined substation and depot at Leipsic, O.

Shamokin & Mt. Carmel Transit Company, Shamokin, Pa.—This company proposes to build an addition to its power station, 40 by 75 feet. A 750-horsepower Corliss-Cooper engine and one 500-kilowatt General Electric generator will be installed. E. W. Samuel, president and general manager, Mt. Carmel, Pa.

Personal Mention

Dr. H. C. Harrison has been appointed chief surgeon of the United Railways & Electric Company, Baltimore, Md., succeeding the late Dr. J. R. Trimble. Dr. Harrison has been on the surgical staff of the company for a number of years.

The recent appointment of Mr. Arthur L. Linn, Jr., as general auditor of the Schenectady Railway on March 2, 1908, places him in charge of the accounting of all of the railway and lighting companies in which the Mohawk Valley Company is interested, in addition to which he is either the secretary or assistant secretary of 15 of the 19 companies. Mr. Linn's office is located in the Night and Day Bank building, New York City.

Mr. Frank R. Henry has resigned as president of the American Street and Interurban Railway Accountants' Association. As stated in last week's issue of the Electric Railway Review, Mr. Henry has resigned as auditor of the United Railways Company of St. Louis to become vice-president and secretary of the Majestic Manufacturing Company of St. Louis. Mr. Henry felt that his new duties would require his undivided attention for some time and that therefore in justice to the association and the success of its next annual meeting he should resign.

Mr. Lester G. French, formerly editor-in-chief of Machinery, has been appointed to take charge of the editorial work of the American Society of Mechanical Engineers. An improvement is to be made in the monthly "Proceedings" of the society by establishing departments, thus providing a greater variety of technical articles. All such articles, however, will first be presented and discussed before the society at its meetings, as before. Mr. French is a graduate of the Massachusetts Institute of Technology and has written several text books on mechanical subjects.

Mr. F. F. Barbour, who was recently appointed assistant to President B. S. Josselyn of the Portland (Ore.) Railway Light & Power Company, has been for several years manager of the sales department of the General Electric Company at San Francisco. He was born in Boston, Mass., and was educated in the public schools of Cambridge, Mass., and the Massachusetts Institute of Technology, class of 1887. After three years in civil engineering work in Minnesota, Dakota and Illinois in connection with steam railway construction he began electrical work with the Thomson-Houston Company, Lynn, Mass., in the railway construction department. While in this department he was connected with the electric railway lines at Louisville, Ky., Topeka, Kan., and for a year was at Denver, Colo., installing equipment for the Denver City Tramway. From Denver he went to California as engineer of the San Francisco office of the Thomson-Houston Company, remaining in that position for a number of years. He was then transferred to the selling organization, and for several years past has been manager of the sales department of the General Electric Company at the San Francisco office. During his association with the General Electric Company in California, he contracted for the first three-phase long-distance transmission system on the Pacific coast, at Redlands, Cal., which is now a part of the system of the Edison Electric Company of Los Angeles.

Mr. D. S. Carll, who recently was elected second vice-president and general manager of the Capital Traction Company, Washington, D. C., as announced in the Electric Railway Review of March 21, was born in 1855 at Huntington, L. I. He graduated from the Huntington Union School in 1875 and immediately engaged in surveying work, from 1877 to 1881 being surveyor to the commissioners of highways of Huntington, N. Y., and later assistant engineer in charge of construction of seven miles of the Long Island Railroad's line from Patchogue to Eastport, N. Y. From September, 1881, to May, 1883, he was assistant engineer in charge of construction of eight miles of the New York West Shore & Buffalo Railway in Ulster county, New York. From 1883 to 1887 he served in the department of public works, New York City, as leveler and later as transitman on surveys, borings, etc., for the new aqueduct and reservoirs. In March, 1887, he went to Kansas City, Mo., as assistant engineer of construction for the Grand Avenue Railway. While in Kansas City he served for a time with the Metropolitan Street Railway and was assistant engineer for the firm of Knight & Bonteeou of that city. From October, 1889, to September, 1890, he was superintendent of grading and construction in the city engineer's office at Kansas City, resigning in November, 1890, to become assistant engineer, with entire charge of constructing the cable system for the Washington & Georgetown Railroad, Washington, D. C. In 1892 he was appointed chief engineer and in 1895, when this company and the Rock Creek Railway of the District of Columbia were merged by a special act of congress into the Capital Traction Company, Mr. Carll, in addition to his duties as chief engineer, was made superintendent of the merged lines, which positions he has held until his recent election as vice-president and general manager. Mr. Carll is a member of the American Society of Civil Engineers.

Mr. F. A. Burkhardt, whose portrait is presented herewith, has been appointed assistant general passenger and freight agent of the Ohio Electric Railway, with headquarters at Lima and Dayton, O.; effective on March 19. His jurisdiction will extend over all divisions. Mr. Burkhardt entered railway service in 1897 as assistant ticket agent of the Cincinnati Hamilton & Dayton Railway at Lima, O., and three years later became agent at Lima of the New York Central Lines. In 1901 he was appointed joint agent of the Cincinnati Hamilton & Dayton and the New York Central Lines at Lima. In 1906 he was appointed division passenger and freight agent for the Schoepf syndicate at Lima, O., with jurisdiction over the Lima & Toledo Traction Company, the Ft. Wayne Van Wert & Lima Traction Company and the Columbus & Lake Michigan Railroad, which have been absorbed and are now operated by the Ohio Electric Railway.

F. A. Burkhardt.

Mr. W. C. Crawford of Tilbury, Ont., was recently elected first vice-president of the Windsor Essex & Lake Shore Rapid Railway of Windsor, Ont., a new single-phase line between Windsor and Kingsville, Ont., which was placed in operation in September, 1907, and was described in the Electric Railway Review of December 21, 1907, page 946. Mr. Crawford has been connected with the Windsor Essex & Lake Shore for about three years and has heretofore been treasurer of the company. He was born near St. Mary's, Ont., 49 years ago and has resided for the past 20 years in Tilbury, Ont., where he owns one of the largest retail stores in the province. He has also been engaged for 17 years as a manufacturer of turned goods. He has been a member of the city council for 17 years. Mr. Crawford has recently become actively interested in electric railways, which are now performing an important function in the development of Ontario. He is also one of the directors of the Windsor Chatham & London Railway, which is allied with the Windsor Essex & Lake Shore, and which proposes to build an extension from Leamington to Tilbury this year, and ultimately to Chatham. An extension from Kingsville to Leamington will be in operation about April 15.

W. C. Crawford.

Mr. George B. Thomas of Cleveland, O., has been appointed general manager of the New York & North Shore Traction Company, Mineola, N. Y., which has recently completed the first 10-mile section of its interurban road from Mineola to Roslyn and Port Washington, N. Y., succeeding Mr. Thomas Wood, resigned. Mr. Thomas resigned as secretary and assistant treasurer of the Cleveland Construction Company to accept his present position.

Financial News

Brooklyn Rapid Transit Company.—It is reported that J. P. Morgan & Co. have purchased a block of bonds of this company and will be represented on the board of directors.

Delaware River & Atlantic City Railroad.—At the conclusion of the proceedings before Vice-Chancellor Leaming in Camden, N. J., the vice-chancellor said that he could not and ought not to name a receiver. Another application was made by counsel for an estate which is a creditor, for a rule to show cause why a receiver should not be appointed.

Elmira (N. Y.) Water Light & Railroad Company.—Approval of the issue of $372,000 of first consolidated mortgage bonds, due on September 1, 1956, has been given by the New York public service commission, second district. The bonds are to be issued at not less than 80 per cent of par and will provide for refunding and for the completion, extension and improvement of the property. With this addition there will be $1,604,000 of bonds of this issue outstanding.

Hudson Companies, New York.—The circular issued by Harvey Fisk & Sons of New York, offering for sale the 2-year 6 per cent notes, states: "There has been expended by the Hudson Companies to December 31, 1907, upon the Hudson and Manhattan system, including tunnels, stations, power houses, terminal buildings, equipment, electrical and other machinery and expenses incident thereto, the sum of $34,190,-164.41. Annual net earnings of the system are conservatively estimated at $4,000,000, a sum largely in excess of all fixed charges. From present schedules rental sources alone, including the rentals from the terminal buildings at New York, where the company's station occupies the entire underground section, will produce more than one-half the amount of the interest charges on the Hudson & Manhattan Railroad first mortgage bonds."

International Traction Company, Buffalo, N. Y.—Gross earnings in 1907 were $5,445,070, an increase of $420,772 over 1906. Henry J. Pierce, the president, states in the annual report: "Fifty new pay-as-you-enter cars were purchased and put in service in January, 1908, on our Niagara street line in Buffalo. They have proved a marked success, the municipal authorities, the public and the newspapers joining in praise of the new system of car operation. The work of installing the pay-as-you-enter feature upon 150 of our standard cars has been begun at the Cold Springs shops, and will be pushed to completion, so that before the end of this year there will be 200 pay-as-you-enter cars in operation in Buffalo out of a total of 600 operated."

Metropolitan Street Railway, New York.—The protective committee representing holders of the general mortgage collateral trust 5 per cent bonds has been enlarged by the addition of William P. Dixon and Henry Evans.

New York City Railway.—A hearing on the application of the receivers for authority to issue $3,500,000 took place before Judge Lacombe of the United States circuit court, New York, on March 20. Judge Lacombe said that the first thing to be considered was the benefit to the traveling public. "If cars and barns are burned they must be replaced," he said, "and the sole purpose of issuing certificates is to improve the property on which the trust companies hold mortgages. The First Avenue line should be put in proper shape to run and the way the money is to be spent can be amply arranged for in the order."

New York New Haven & Hartford Railroad.—The majority report of the commission on commerce and industry to the Massachusetts legislature favoring the proposed merger of the Boston & Maine Railroad with the New York New Haven & Hartford Railroad states that of the total assets of the latter road on June 30, 1907, there was invested in street railway, lighting and power properties and securities 19.93 per cent, or $74,705,464. The commission finds that the New Haven company controls 16 electric street railways in Massachusetts, representing about one-fifth of the total mileage and nearly one-sixth of the total capital of street railways in the state. The report of the commission continues: "There have been two large questions underlying the problem of street railway management: first, how far they should be allowed to combine with each other; second, how far steam railroads should be allowed to control them. The first of these questions was settled in 1897 by the passage of an act allowing street railways to consolidate and the railroad commissioners, in their report for the year 1901, speak with decision of the good results of consolidations. To permit combination of street railways among themselves may be accepted, therefore, as the settled policy of this state. A combination of management between steam railroads and street railways on the other hand, is now forbidden by law; but the subject is so far under active discussion that it cannot be said that the policy is finally settled." The commission therefore recommends that for the purpose of holding together those 16 street railways, at least until it appears desirable to dismember the combination, and of putting them in a manageable position, the New Haven company be required, as a condition of its acquiring control of the Boston & Maine road, to transfer the shares of Massachusetts street railway companies which it holds or controls to a new corporation to be formed for the purpose, on the board of directors of which the state would be represented.

Northern Texas Electric Company, Ft. Worth, Tex.—The report of the Northern Texas Traction Company, a subsidiary company, has been filed with the city secretary of Dallas, Tex. Of the gross earnings of $1,060,157, $772,313 was received from passengers and $275,885 from the sale of tickets. The amount of claims outstanding against the company for damages on December 31, 1907, was $1,079,766.

Ohio Electric Railway.—A block of general and refunding mortgage 5 per cent bonds of the Indiana Columbus & Eastern Traction Company, an underlying road, is offered by Drexel & Co. and Ervin & Co. of Philadelphia and E. H. Rollins & Sons and Adams & Co. of Boston. The bonds are dated May 1, 1906, and are offered at 96 and interest. The total authorized issue is $12,000,000, of which there are outstanding, including an amount reserved to retire $1,255,000 divisional liens, $7,500,-000. The Indiana Columbus & Eastern Traction Company has 444.79 miles of track. The Ohio Electric Railway guarantees the interest on the bonds and 5 per cent dividends on the $1,000,000 of preferred stock of the traction company. With connecting lines in Ohio and Indiana, controlled by the same interests, the road forms part of a system of over 1,700 miles.

Public Service Railway, Newark, N. J.—Edward J. Moore has been elected a director of the South Jersey Gas Electric & Traction Company, a subsidiary, to fill the vacancy caused by the death of Thomas C. Barr.

Spokane & Inland Empire Railroad, Spokane, Wash.—An offering of $250,000 of first and refunding mortgage 5 per cent bonds has been made by the Harris Trust & Savings Bank of Chicago. A letter from Jay P. Graves, president of the company, states: "The lines should be considered from the steam railroad standpoint rather than from that of the electric railroad, as they transport all kinds of heavy and light freight, as well as passengers, have freight and passenger terminals in the heart of the city, and interchange freight with the trunk line steam railroads on favorable terms."

Third Avenue Railroad, New York.—Coupons due on January 1, 1908, on the $5,000,000 of first mortgage 5 per cent bonds were paid on and after March 20, 1908.

West India Electric Company, Ltd., Kingston, Jamaica.—The annual report for 1907, presented at the meeting of shareholders in Montreal, showed gross earnings of $198,845, operating expenses of $94,805, and net earnings of $101,040. Taxes, interest and rentals were $46,953, leaving a surplus of $57,087.

West Jersey & Seashore Railroad, Camden, N. J.—Gross earnings in 1907 were $5,654,903, an increase of $148,619 over 1906. In the annual report James McCrea, president, states that "judging by past experience and the business that is being developed through the electric service and improved facilities, the earnings will produce in the near future commensurate increases in your net revenues."

Dividends Declared.

Bangor (Me.) Railway & Electric Company, quarterly, 1 per cent.

Cincinnati (O.) Street Railway, quarterly, $1\frac{1}{2}$ per cent.

Havana (Cuba) Electric Railway, preferred, quarterly, $1\frac{1}{2}$ per cent.

Louisville (Ky.) Traction Company, common, quarterly, 1 per cent; preferred, $2\frac{1}{2}$ per cent.

Rochester (N. Y.) Railway, preferred, quarterly, $1\frac{1}{4}$ per cent.

Springfield (Ill.) Railway & Light Company, quarterly, 1 per cent.

United Railways of St. Louis, preferred, quarterly, $1\frac{1}{4}$ per cent.

Washington Water Power Company, Spokane, Wash., quarterly, $1\frac{3}{4}$ per cent.

The membership of the American Institute of Electrical Engineers has increased more than 25 per cent during the past year and now exceeds 5,400. There are now 37 active sections or branches located in the principal electrical sections of the country.

Manufactures and Supplies

ROLLING STOCK.

Columbus Urbana & Western Electric Railway, Columbus, O., is asking prices on one interurban car.

Interborough Rapid Transit Company, New York, has ordered 125 equipments from the General Electric Company.

New York Central Lines have placed an order with the American Locomotive Company and the General Electric Company for 12 electric locomotives.

Third Avenue Railroad, New York, through its receiver, has placed an order with the General Electric Company for motors, controllers and brakes for 125 cars.

International Railway, Buffalo, N. Y., is remodeling 150 of its standard type cars, in order that the pay-as-you-enter system of fare collection may be used on them. This work is being done at the company's Cold Spring shops.

Montgomery Traction Company, Montgomery, Ala., has placed an order with The J. G. Brill Company for eight convertible Narragansett type double-truck cars, as reported in the Electric Railway Review for February 29. These cars will be mounted on Brill 27 G.E. 1 trucks and will be equipped with Brill seats and gongs. Some of the details follow:

Seating capacity	40 passengers
Wheel base	4 ft. 6 in.
Length of body	28 ft. 4 in.
Over vestibules	40 ft. 4 in.
Over all	42 ft.
Width over posts	8 ft. 6¼ in.
Height floor over roof board	8 ft. 7½ in.
Track over trolley board	12 ft. 5⅜ in.

Chicago Ottawa & Peoria Railway, H. E. Chubbuck, general manager, Ottawa, Ill., has placed an order with the Danville Car Company for six closed double-truck cars, as reported in the Electric Railway Review of March 14. These cars will be used as trailers. They are to be mounted on Danville Car Company trucks and equipped with Acme curtain fixtures, Pantasote curtain material, Peacock hand brakes and Hale & Kilburn seats. Delivery is to be made June 1. The following details are included in the specifications:

Seating capacity	48 passengers
Weight	35,000 lb.
Wheel base	4 ft.
Length of body	32 ft.
Over vestibule	39 ft. 10 in.
Over all	40 ft. 10 in.
Width inside	8 ft. 2½ in.
Over all	9 ft.
Height inside	8 ft. 4½ in.
Sill to trolley base	9 ft. 7 in.
Track to trolley base	11 ft. 11 in.
Body	Semi-steel
Underframe	Semi-steel

Northern Ohio Traction & Light Company, Akron, O., which was reported in the Electric Railway Review of January 18 to be in the market for four interurban cars, has placed this order with the G. C. Kuhlman Car Company. Delivery is to be made in April. Included in the specifications are the following details:

Seating capacity	58 passengers
Weight	74,000 lb.
Wheel base	7 ft.
Length of body	43 ft.
Over all	53 ft.
Width inside	8 ft. 1 in.
Over all	8 ft. 8 in.
Height inside	7 ft. 10 in.
Track to trolley base	12 ft. 10 in.
Body	Wood
Underframe	Composite

Special Equipment.

Air brakes	Westinghouse automatic
Brakeshoes	Brill
Center bearings	Symington
Curtain fixtures	Forsyth
Curtain material	Curtain Supply Co.
Door fastenings	Brill
Fenders	Eclipse
Gears and pinions	General Electric
Gongs	Dedenda
Hand brakes	Peacock
Heating system	Germer stoves
Headlights	Crouse-Hinds
Journal bearings	Symington
Journal boxes	Symington
Markers	Lintern
Motors	General Electric
Paint	Sherwin-Williams
Safety tread	Mason
Sanders	Nichols-Lintern
Seats	Hale & Kilburn
Side bearings	Brill
Springs	Brill
Trolley retriever	Knutson
Trucks	Brill 27 E
Varnish	Chicago
Ventilators	Globe

Chippewa Valley Railway Light & Power Company, Eau Claire, Wis., which the Electric Railway Review of January 25 reported to be in the market for two interurban cars, advises that the purchase of this equipment is again under consideration.

Chicago Railways Company has specified the following special equipment for the 300 cars ordered from the Pullman Company on March 19, as reported in the Electric Railway Review for March 21: General Electric motors and control system, Hale & Kilburn seats, Forsyth curtain fixtures, Pantasote curtain material.

SHOPS AND BUILDINGS.

Connecticut Railway & Lighting Company, Bridgeport, Conn.—It is reported that this company has had plans prepared for the construction of car houses at Bridgeport.

TRADE NOTES.

Northern Engineering Works, Detroit, Mich., is building two 3-motor 66-foot span electric traveling cranes, equipped with new type E trolley, for a steel plant in Japan.

Standard Steel Tie Company has been incorporated with a capital stock of $133,000 by A. V. Jones, 123 West One Hundred and Sixteenth street, F. W. Mills and H. M. Browne, 154 Nassau street, all of New York.

Freeborn Engineering & Construction Company, Kansas City, Mo., has been awarded a contract for the engineering and construction work on a plant for the Crushed Stone & Filler Company, to be erected at Sugar Creek, Mo. The engineering work has been started and construction work will follow immediately.

John A. Brill, vice-president of The J. G. Brill Company, died in Philadelphia, Pa., on March 25. Mr. Brill had a broad knowledge of the operating conditions of railways, as is evidenced by nearly 200 patents issued to him on cars and trucks and parts of their equipment. He conceived the fundamental principle of electric truck construction—an independent frame for the support of the motor—and the first truck built on this principle was of his design.

T. H. Symington Company, Baltimore, has lately secured an order through its London agents, G. D. Peters & Co., for ball bearing center and side bearings for 153 passenger coaches under construction in England for the Northwestern Railway of India, and for side bearings for 38 passenger coaches for the same railway. This order follows very shortly an order received for center and side bearings for 54 coaches likewise under construction in England for the Bombay Baroda & Central India Railway. Baltimore center and side bearings have been very thoroughly tested during the past two years under the rolling stock of a number of English railways with such satisfactory results that the Symington company reports there is every indication of a large foreign business in prospect for this device. Some of the foreign roads which are using Baltimore bearings are the London Undergronnd, London & Northwestern, Great Central Railway of England, Lancashire & Yorkshire Railway of England, Belfast & Northern Counties Railway of Ireland, Buenos Aires Western Railway of Brazil, Imperial Government Railway of Japan and the Bengal Nagpur Railway of India.

American Locomotive Company's strong financial position is shown in a circular issued by Harvey Fisk & Sons, bankers, New York, in which the 7 per cent cumulative preferred stock of the locomotive company is offered for sale. The following are comparative figures taken from the company's first report, published in 1902, and its last report, published in 1907:

Year ending June 30—	1902.	1907.
Capital stock, preferred	$25,000,000	$25,000,000
Capital stock, common	25,000,000	25,000,000
Cost of property as per balance sheet	45,482,293	46,925,096
Bonded debt of constituent companies	1,512,500	2,992,500
Working capital	4,998,916	13,756,587
Profit and loss, surplus	224,235	7,963,580
Plants	8	10
Acreage	157	469
Earnings	$26,398,394	$49,515,486
Expenses	23,291,217	42,744,381
Net earnings	$ 3,107,177	$ 6,771,105

Since its organization the American Locomotive Company has expended from earnings $8,052,250 for improvements and additions to properties, aside from the annual appropriations for betterments and replacements. The company has also expended $1,883,556 in acquisition of the stock of the Locomotive & Machine Company of Montreal, Limited, and $1,972,115 for the stock of the Rogers Locomotive Works, Paterson, N. J. During the same period the working capital of the company has been increased $8,757,671, which, added to the sums above enumerated as provided for extraordinary im-

provements and expended in the acquisition of new property, makes an increase of $20,665,592 in the value of the assets, with practically no increase in capital liabilities.

ADVERTISING LITERATURE.

H. W. Johns-Manville Company, 100 William Street, New York, N. Y.—A leaflet is devoted to a description of Arido dry furnace cement.

H. W. Johns-Manville Company, 100 Williams Street, New York, N. Y.—A combination mailing card folder is devoted to J-M asbestos roofings.

Koehring Machine Company, Milwaukee, Wis.—A new catalogue of handy size is devoted to descriptions and illustrations of concrete machinery.

General Compressed Air & Vacuum Machinery Company, St. Louis, Mo.—Pneumatic cleaning equipment for passenger cars is illustrated and described in Bulletin No. 60.

National Brake & Electric Company, Milwaukee, Wis.—National type "3VS" air compressors are described and illustrated on a card of tasteful design and convenient form.

B. F. Sturtevant Company, Hyde Park, Mass.—Bulletin No. 153 of the engineering series is entitled "There is Nothing New—Not Even in Fans," being a reprint from a technical magazine.

Ohmer Fare Register Company, Dayton, O.—A 4-page leaflet presents facts and figures to prove that the fare registers of its manufacture will prevent the usual losses in fare collections.

J. A. Boughton, 1515 St. Clair Street, Cleveland, O.—An illustrated booklet is devoted to a special design of cast semi-steel tie, which has been patented in the leading countries of the world.

Bryant Zinc Company, Chicago and New York.—A handsomely bound catalogue of 200 pages has been issued showing the complete line of signal and battery supplies manufactured and handled.

Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 1513 describes portable air compressors, which are built for capacities of 11, 16, 20 and 50 cubic feet of free air per minute. Each is constructed throughout with strength to withstand a working pressure of 100 pounds per square inch.

The J. G. Brill Company, Philadelphia, Pa.—The March number of Brill's Magazine contains the usual amount of interesting matter, including an illustrated description of the second lot of 150 pay-as-you-enter cars for the Indiana avenue line of the Chicago City Railway. A number of both foreign and domestic car shipments are illustrated and described.

KALAMAZOO TROLLEY WHEELS.

When the "Kalamazoo" trolley wheel was first placed on the market a few years ago some very strong prejudice against anything new in trolley wheels was encountered. It was then believed by railway men that nothing better than the common brass wheel could profitably be used. Since that time the "Kalamazoo" wheel is said to have demonstrated its service value by giving a surprisingly large mileage per wheel.

This wheel is now used on many of the largest electric railways in the United States and it is claimed for the wheel that no railway which has once adopted it has ever discarded it for one of another make. The wheel is made of pure lake copper, treated by a special process known only to the manufacturer, which gives it the quality of softness combined with a requisite toughness. No scrap nor alloy is used in the manufacture of the wheel.

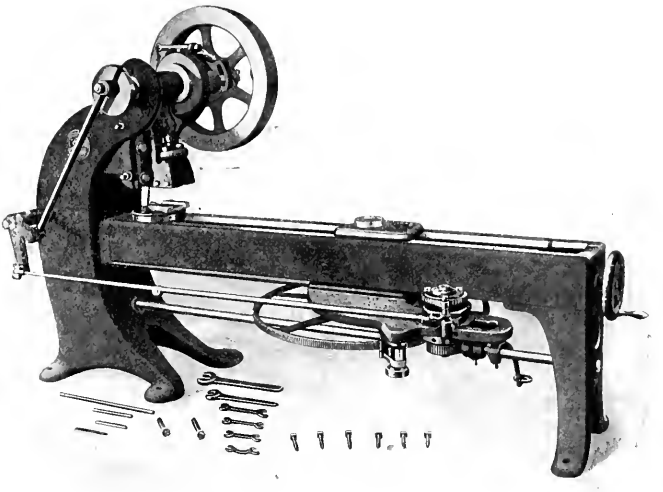
The oiling device, which is one of the unique features, insures thorough lubrication of the bearing surface at all times and thereby prevents unusual wear of the conductor wire and destruction of the bushings.

The Starr Brass Company, Kalamazoo, Mich., is now making 22 different styles of the "Kalamazoo" wheel, many of which have been designed to give the highest possible mileage on the various types of overhead construction found on different railways. The company is also making an improved trolley harp, which is giving exceedingly good results. Some of the advantages claimed for the harp are that it prevents the contact springs from wearing and breaking and makes it possible to change wheels quickly.

FERRACUTE ARMATURE DISC NOTCHER.

The armature disc notching machine shown in the accompanying illustration exhibits the latest improvements in this class of presses built by the Ferracute Machine Company of Bridgeton, N. J. The appearance of the machine is pleasing. The castings are well proportioned with neatly rounded corners.

The indexing mechanism is operated from the crank shaft through the medium of the bell crank shown at the side. The connection from this crank to the pawl lever is by means of a telescopic pitman made of bicycle tubing so that it can be adjusted to the different positions of the saddle (carrying vertical indexing spindle) required by the varying sizes of discs. On the lower end of the indexing spindle is placed a large gear wheel, into which engages the pinion that is on the same shaft with the ratchets.



Ferracute Armature Disc Notcher—Side View.

Various ratchets are supplied and they can be quickly changed when required, although a given disc will give a considerable range of indexing by varying the number of notches taken at each stroke. On the large gear is a tappet, which, when the wheel has made one revolution, throws out the clutch and stops the machine, and, when the wheel has been moved for a notch, a brake, operated by the same connection to the crank shaft, prevents the gear from going beyond its proper position or overrunning when moving fast, thus holding it still while the punch is descending. This brake enables the machine to be operated at a higher rate of speed than would be possible without it up to 200 strokes on the smaller discs. The die bed is adjustable vertically so that the die can always be set at the right height, and the depth of the notches can be accurately secured by means of the screw movement of the saddle upon the bed.

There are three sizes of presses in this series. Press C93 (the one illustrated) notches discs up to 84 inches in diameter; press C92 up to 48 inches; and Press C94 up to 120 inches in diameter. The length of the machine (right to left) is about 8 feet; width, 3½ feet; height, 5 feet 3 inches. The total weight is 2,600 pounds.

VERA CRUZ, MEXICO, TO HAVE ELECTRIC RAILWAY.

The Vera Cruz Electric Light Power & Traction Company of Vera Cruz, Mexico, which company is owned by S. Pearson & Son, has completed arrangements to provide that city with electric railway service in addition to the power and lighting service it is now supplying. A very large extension is being made to this company's power plant equipment at Vera Cruz. The new machinery includes six 470-kilowatt alternating-current generators, which are to be run by Diesel

oil engines. The current for the power and lighting throughout the city will be distributed underground.

For the traction service the company has recently ordered of G. & O. Braniff & Co., to come from the works of the Westinghouse Electric & Manufacturing Company of Pittsburg, Pa., two 120-kilowatt motor generator sets, which will be used to furnish direct current for railway use.

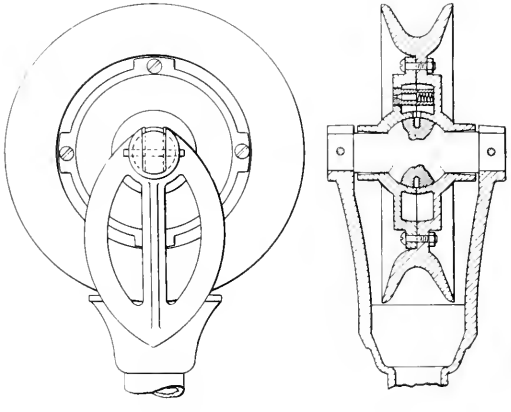
Storage batteries will be employed. The order for new equipment includes a 30-panel switchboard complete with all the instruments for the control of the new generators, power and lighting feeders, motor generator sets, battery, railway feeders, etc.

There will be 11 double motor equipments for the cars, including motors, controllers and auxiliary apparatus.

When this plant is completed Vera Cruz will be provided with one of the best and most modern installations of its kind in the republic and the first of its size employing this type of engine in this country

THE WOBBLE TROLLEY WHEEL.

The attractive features of the Humphrey "wobble" trolley wheel are its globe-shaped bearing, special oiling scheme and the simplicity of construction. Each of these the manufacturer claims tends to reduce and eliminate many of the trolley wheel troubles experienced with the ordinary wheel and bearing.



The Humphrey Wobble Trolley Wheel.

As is shown in the illustration, the wheel is made in two parts. The main section includes the rim and one-half of the oil chamber and hub. A complementary section or cap fits into the concave surface provided at one side of the main casting and completes the formation of an oil chamber for carrying oil for lubricating the bearing. It will be noted that the hub of the wheel is cast with a spherical bearing surface and with shoulders slightly tapered to allow the wheel to freely change its position on the axle. This allows the wheel to follow the trolley wire, even at acute angles, without unnecessary friction on the hub or on the wire.

The axle is made of drop-forged steel and is spherical in shape at the center. The axle fits into pockets in the harp and is held in position by cotter pins. This arrangement makes it a simple matter to change wheels.

The wheel has no contact springs. It is well known that whenever an arc is formed on a trolley wheel a burr is left on the inside of the groove, which increases the wear on the overhead wire to a great extent. The globe bearing of the Humphrey wheel insures at all times a perfect contact between the hub and the axle and between the wheel and the wire, thus assuring high conductivity and long life at the wheel.

The oiling scheme consists of an oil chamber filled with felt, which, when saturated with oil, distributes the lubricant evenly over the surface of the bearing. The oil is inserted through an opening in the oil chamber, which is closed by a ball held in place by a spring. Under the severest operating conditions this chamber needs filling only once in seven days.

In severe service the wheel is guaranteed by its maker to run 10,000 miles. It is manufactured and sold by the Humphrey Trolley & Manufacturing Company, Detroit, Mich.

IMPROVED LOCKING SOCKET FOR INCANDESCENT LAMPS.

A special lamp socket has recently been placed on the market by the General Electric Company, which should prove very attractive to managers of amusement resorts and electric railways who suffer lamp losses by petty thievery or by jarring from car fixtures.

In the old style of locking socket the lamp was held rigid in the socket, and attempts to remove it generally resulted in

A Locking Lamp Socket.

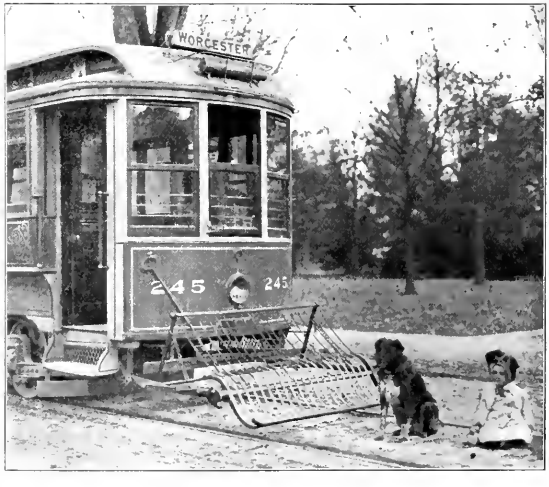
breaking the globe. In the new style the screw shell turns freely and the lamp cannot be removed until the shell is unlocked with the key.

The socket is shown in the accompanying illustration, and it should be noted that the addition of the locking feature has been made without detracting in any way from the neat appearance of the standard socket.

This locking socket should also appeal to those who had contemplated using the higher priced tantalum and tungsten lamps, but who had deferred doing so on account of the extra inducements offered to the sneak thief.

WORCESTER DOUBLE-ACTING FENDER.

The Worcester Railway Supply Company is manufacturing at Worcester, Mass., the double-acting fender illustrated in the accompanying halftone engraving. In this illustration



Worcester Double-Acting Fender—Operating Position.

the fender is set in its running position. The lower portion of the fender, it will be noted, is a curved steel grid carried on a horizontal shaft. A protective basket extends from the dash of the car to this same shaft. When an object is struck by the fender, the forward portion immediately opens up and

withholds the object until the fender is again set in position by the motorman. When not in use, the fender may be folded closely against the dash of the car.

ELECTRIC FLOOR SURFACER.

Electric railways which operate dance pavilions, roller skating rinks and bowling alleys are often put to considerable expense for resurfacing the floors as they become worn or warped. To facilitate this work and enable floors to be surfaced at a low cost the Real Estate Improvement Company, Providence, R. I., is promoting the sale of the Wattles electric floor surfacing machine. The accompanying illustration shows three of these machines as they appear in service.

The device comprises an electric motor driving surfacing cutters which plane wooden floors so that they are as smooth as when newly laid. Special claims are made for the effective work done by this machine. Economy is gained by its use because, even though power is required, the work can be done more quickly than by hand and with better results. Meanwhile there is no dust and dirt stirred up.

The Wattles Electric Floor Surfacer Machines in Use.

SEMI-CONVERTIBLE CARS FOR THE UTAH LIGHT & RAILWAY COMPANY.

There have just been delivered to the Utah Light & Railway Company 50 handsome cars of the latest semi-convertible type, designed and built by the St. Louis Car Company. The car bodies are 30 feet over corner posts, 44 feet over all and are mounted on the builder's No. 47 trucks. The width from arm rails is 8 feet 4 inches. The interior of the cars is finished in natural cherry, rubbed to a dead finish and then polished. They are provided with the St. Louis Car Company's latest type of Walkover rattan covered cross seats. The car builder has furnished these semi-convertible cars free of all the weak features heretofore said to obtain in this type. The arrangement of the sashes and the various mechanical devices used in connection with storing them under the roof were designed with the most careful attention to mechanical details.

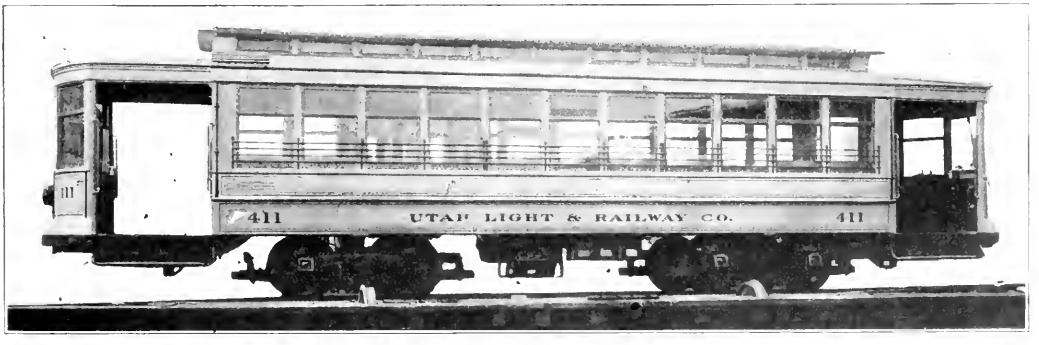
Owing to the extremely long platforms, which are seven feet in length at each end of the car, it was necessary to provide for a very heavy live load on each platform. The middle platform knees are made of 60-pound T-rails, extending through and back of the body bolsters, firmly riveted to cross bracing. In order to allow the platform flooring to be securely fastened to these middle knees, an oak strip was bolted to each, to which the platform flooring is screwed. The outside knees consist of heavy channel irons, bent to shape and bolted at the rear ends, through the side sills and truss plate.

Semi-Convertible Cars for Salt Lake City—Interior Finish.

The car body is provided with an extra heavy truss plate and in addition a very heavy truss.

While the bodies are of the concave and convex panel type, the rails and strainer were made sufficiently heavy to take care of any stresses which might be put upon the body. While the ordinary semi-coach type of car is considered stiffer than the panel type, these cars are said to be not only lighter but very much stronger than the straight side car could have been built with the same weight of material.

The Utah Light & Railway Company has adopted the St. Louis Car Company's No. 47 truck as its standard and will replace by it all of its other older types of double trucks.



Semi-Convertible Cars for Salt Lake City—Side View.

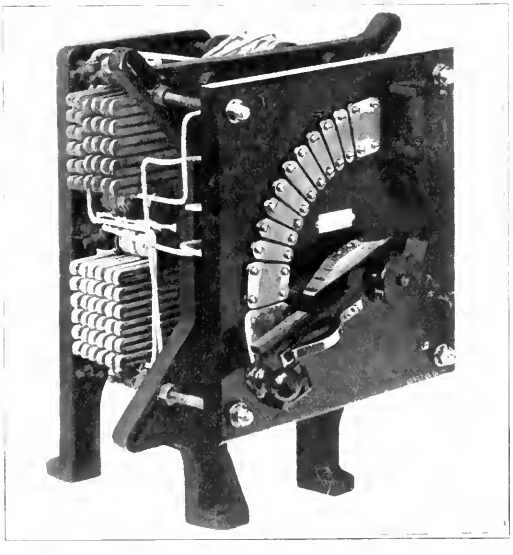
Dossert & Co., 242 West Forty-first street, New York, report a steady increase in orders received for the Dossert solderless connectors. Among the recent orders are third-rail clamp connectors for 1,000,000-circular-mil cables for the New York Central & Hudson River, cable taps, 400,000 circular-mils, main to No. 0000 feeders for the Chicago City Railway and cable taps for 1,000,000-circular-mil cables for the Syracuse & South Bay Electric Railway.

WESTINGHOUSE DIRECT-CURRENT STARTING RHEOSTATS.

The increasing use of electric drive in repair shops warrants attention to the choice and care of starting boxes. Direct-current motors, except in the smallest sizes, require some sort of starting device to keep the current within safe limits and also to prevent the motor from starting with too great a rush. The necessity of using satisfactory starting devices is therefore as great as to have the motor itself reliable. The Westinghouse Electric & Manufacturing Company has developed a line of face plate starters which are thoroughly satisfactory and fully meet the specifications and conditions laid down by the National Board of Fire Underwriters and the American Institute of Electrical Engineers.

All starting rheostats are intended for use only when bringing the motor up to speed, and are not designed for regulating the speed. Speed regulating rheostats may be obtained, but they are intended either to vary the field current of the motor or else they must be able to regulate the much larger armature current. The rheostat which regulates the armature current must be capable of carrying the full line current continuously. Therefore this type of rheostat is considerably more expensive than the starting rheostats which are in service for only the short and infrequent periods of starting. The lower cost of the starting rheostat does not interfere with its absolutely satisfactory operation for the intermittent service of starting for which it is designed.

The starters for motors on 110 volts up to 22 horsepower or 220 volts up to 35 horsepower use the bar type of resistance, which consists of a resistance wire wound on iron bars which are first covered with a fireproof material. The ends of the bars are held in place by porcelain pieces, clearly shown in one of the illustrations. The construction is strong and rigid, so that adjacent turns on the same bar cannot short-circuit, nor can turns on one bar come in contact with turns



Direct-Current Starting Rheostats—Bar Type Open for Inspection.

on another bar. The whole construction, resistance, iron frame, slate front, contact arm, etc., is fireproof.

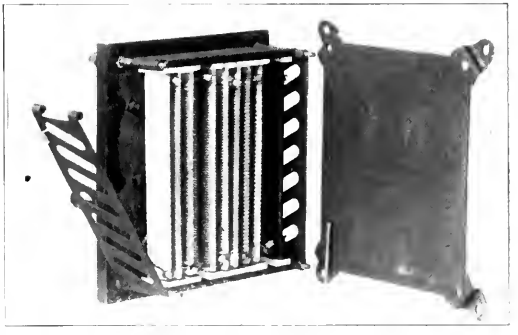
Another feature embodied in these starters is the low voltage release. The contact arm will positively fly back to the off position if the current is shut off from the line or if the voltage falls below a fixed limit. This prevents damage to the motor should the current again be thrown on or the voltage rise suddenly to its full value. The method of connecting the magnet of the release coil will be found of special benefit where the field of the motor is to be regulated. The magnet is connected across the line independently of the shunt field and is unaffected by variations in the field current.

A small button type of rheostat is used on the smaller types of motors and is capable of carrying 80 amperes. For the larger motors larger contacts are required; this requirement is met by furnishing renewable contacts, as shown in one of the illustrations of the 160-ampere rheostat. In this larger type of starter a special short-circuiting brush is provided which cuts out the last contact, insuring the lowest resistance possible.

For starting motors on 110 volts of 25 horsepower or 220 volts 45 horsepower and larger, the grid type of resistance is used, which is fully ventilated and will stand the heavy duty required in starting large motors. All contacts, brushes, fingers and springs may be removed from the front with ease.

The line of rheostats is described in Leaflet No. 9000, with full information as to dimensions, carrying capacities, etc. This line of starters is adapted for 110, 220 and 500 volt motors.

As these rheostats are used only in starting the handle will not remain on any point except the last unless held.



Direct-Current Starting Rheostats—Grid Type Starter with 240-Ampere Face Plate.

They are intended to bring the motor up to speed in 15 to 30 seconds according to size, and are made for full load conditions.

ELECTRIFICATION IN MEXICO.

Compania Minera Las Dos Estrellas is the first in the republic of Mexico to electrify a steam railroad, by doing which its locomotive equipment is increased to seven locomotives. In view of the considerable saving made in the last two years in operating this property by electricity in place of steam, orders have been placed for machinery for electrically equipping a part of the present steam road operating between the company's mines and El Oro. To supply current for this work the Westinghouse Electric & Manufacturing Company is now building a 450-horsepower motor generator set, which will be located centrally with regard to the part of the road to be electrified. This set will take its power from the circuits of the Mexican Light & Power Company. The motor will drive a 300-kilowatt direct-current generator, thereby changing the energy into direct current for use on the trolley. A suitable marble switchboard, with necessary panels, instruments, switches and operating devices will be located with the motor generator set.

The first installation will consist of one locomotive, weighing 60,000 pounds, provided with double trucks and a steel cab. It will be a Baldwin-Westinghouse unit. Freight cars will be loaded with ore on the surface at a shaft above the mill and this will be hauled to the Cedro mill of the company on a track over the ore bins, where they will be emptied. The grade is 3.8 per cent, being down grade with load.

Although the Dos Estrellas company already has in operation six Westinghouse electric locomotives, some of which are operating in the mine, others on the surface, and since the introduction of which the cost of hauling per ton has been reduced one-half, this large new locomotive is the first in the country converting a former steam haul into electric.

Whereas this is but the beginning of the electrification of steam roads in Mexico, there is every reason to expect that on account of the economy derived this will spread throughout the country, as it is doing in the United States and abroad.

General Electric Company, Schenectady, N. Y., has received, among recent orders, one from the Sao Paulo Light & Power Company, Sao Paulo, Brazil, for 40 type H oil-cooled transformers.

Positon as chief engineer and machinist wanted. Will go to responsible company on trial. Have had 25 years' practical experience. Address "No. 563," care of Electric Railway Review, Chicago.

Management of street railway amusement park wanted; experienced, up-to-date, sober and reliable. Park playing vaudeville and bands preferred. Experienced in park designing and construction. Best of references. Don't put it off, write me today. Address E. E. Wilmarth, Massillon, Ia.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 568," care of Electric Railway Review, Chicago.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

Master mechanic of undeniable ability and experience is at liberty to accept reasonable offer. Has had 15 years' experience in both steam and electric service. Has exceptional ability in equipping new rolling stock and handling shops and men on economical basis. Address "No. 560," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Park superintendent wanted. State experience and salary wanted; also give references. Address "No. 561," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Superintendents, street railway, machine shop, car works, power house, engineers, electrical and mechanical, draftsmen, electrical and mechanical. Salaries, $800 to $5,000. Other positions open. Write, HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

A thoroughly competent superintendent wanted to take charge of 163 miles of electric railway track and overhead work. Must be fully conversant with latest developments in track and overhead work. Send full particulars regarding experience, age and salary required. B. C. Electric Railway Co., Ltd., Vancouver.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Don't throw away your old batteries. We have a preparation which will positively renew all dry batteries at the cost of two cents each. Trial package and electrical catalogue 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of July 20, 1904, and June, 1906. State condition and price. Address "No. 567," care of Electric Railway Review, Chicago.

Ask us about any book on electric railway and allied subjects. We publish some and sell all that are in print. The Wilson Company, 160 Harrison Street, Chicago.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

We want your friends to read the Electric Railway Review. You will do them—and us—a favor by sending their addresses. We will gladly mail free sample copies. Electric Railway Review, 160 Harrison Street, Chicago.

If interested in any phase of steam transportation, you will find every development covered fully and accurately in The Railway Age. It is the leader and acknowledged authority in this field. Ask for free sample copies. The Railway Age, 160 Harrison Street, Chicago.

A copy of "The Motorman and His Duties," the standard handbook on the theory and practice of electric car operation, is worth many times its cost to every man interested in the subject. Send for 16-page pamphlet of sample pages. The Wilson Company, 160 Harrison Street, Chicago.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts expunged from, and the parts added to, the interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

Flagrant as abuses of transfers are, the limitation of transfer points to a very few intersecting lines of track sometimes tends to increase the congestion of traffic on very busy systems. Any system that encourages the distribution of travel is preferable to the concentration of transfer movement at a very few points. The even distribution of travel on cars going in the same general direction is a great help to the maintenance of good service, both in urban and interurban transit. It is difficult to prevent overcrowding under the most favorable conditions, and if transfers are too restricted in the matter of intersection points, at least in the busy sections of a city, the delays to car service may become troublesome. Ideal conditions are out of the question in the usual transfer problem, but when transfers are given by conductors undue restriction of the points of intersection not only decreases the flexibility of the service from the standpoint of the public, but tends to create excessively slow movements of cars and passengers at the remaining intersections at the street level. American street railways have been too liberal in the matter of transfers, but there still remain cases where the smoothness of car movement would be much bettered by a little wider application of the principle whereby a transfer is valid at all track intersections in the same general direction.

Transfers and Traffic Congestion.

Recent studies and experiments made by the government forest service emphasize very clearly the importance of treating with preservatives the various woods more commonly used for street paving. The growing tendency toward the use of wood blocks in street paving warrants such studies. After many cities throughout the country had experienced decided failures with pavements of untreated native woods attention was turned to the use of these same woods after they had been subjected to various preservative treatments. In Baltimore, Md., in the summer of 1901 there were laid several adjacent strips of experimental pavement composed of the more generally used materials, such as asphalt, brick and creosoted wood. After five years of service and after passing through the great fire the wood was found to be in better condition than any of the other paving materials. Creosoting has generally been supposed to weaken timber. The results of recent experiments conducted by the forest service, however, indicate that the creosote itself does not lessen the strength of the timber, but that this weakening has been due chiefly to improper methods of impregnation. The same requirements which have caused creosote to supersede other preservatives for wood paving call for a larger proportion of high distilling constituents in creosote than is necessary in the preservation of timber for many other purposes. In paving material the necessity for the prevention of moisture absorption makes imperative the use of a larger amount of oil per cubic foot than ordinarily given to railroad ties or other construction timbers. To inject this amount of preservative material into the wood the vacuum-pressure method of treatment has recently been introduced. The experimental pavements now being watched by government engineers will undoubtedly afford new light upon the subject of street surfaces which will be gladly received by electric railway track engineers.

Preserving Paving Blocks.

An editorial article in a recent issue of the Railroad Gazette comments on the stability of electric railway earnings in periods of financial depression as compared with those of the steam roads. The article shows that for the month of December, 1907, a group of 18 fairly representative electric railways increased their earnings 2 per cent over December, 1906. In the same month 61 steam roads decreased 4.28 per cent. In January six electric roads increased their earnings 3.6 per cent, while 53 steam roads decreased 7.45 per cent. Although there is no assumption that these figures possess any comprehensive value as statistics, the results are at least significant as indicating the status of the electric railways as a public necessity which is not materially affected by hard times. A more important comparison is presented in the analysis of the earnings for January, 1908, of the New York New Haven & Hartford system, which includes 1,300 miles of electric railways, city, suburban and interurban, located in four states. The New Haven system presents the more favorable opportunity for comparison because during the year 1907 no important change was made in the mileage of either the steam or the electric lines and because in this case both classes of roads are affected equally by local conditions. In January, 1908, the gross earnings of the lines operated by steam fell off $643,000, or 16 per cent, as compared with January, 1907, while the electric railway earnings in the same period decreased only $21,000, or 2 per cent, and in one state there was a positive gain. While it must be considered that the small loss of the electric roads probably indicates what would have been an increase in normal times, the figures are interesting as showing the results of the first real test of the strength of the electric railways in resisting the effects of a period of stringency.

Electric Railways During Hard Times.

In his communication to the editors, published in last week's issue, J. C. Hutchins, president of the Detroit United Railway, referred with approval to the policy of the commonwealth of Massachusetts in granting indeterminate franchises. An indeterminate franchise presumably confers the right to operate perpetually if adequate service is afforded. Mr. Hutchins speaks of the studious and unemotional officials of governments in Massachusetts. These officials reflect the predominating sentiment of their constituents. In Massachusetts there is a powerful sentiment which assures protection of the rights of property; and the railroad commission of that state recognizes the right of capital to a fair return on investment, and is not swayed by occasional local political movements against street railways. It must be apparent that if it is to be assumed that limited franchises confer no rights which are to be extended upon expiration, the rates of fare provided in initial franchises should be large

Franchise Policy of Massachusetts.

enough to permit companies to return the capital investment to security-holders by the time franchises expire.

CAR HOUSE RECORDS AND TERMINAL CLEANING.

The value of thorough methods for inspecting and cleaning rolling stock does not need demonstration. However, whenever a railway considers this subject worthy of the expert attention which is given it by the Chicago City Railway Company, it is a pleasure to comment on the more important features of such work.

As a factor in successful railway operation the car cleaning and inspection work of any road should maintain its integrity. This departmental unity can only be obtained by strictly following some system of reports and these reports must be so designed that at any time the head of the cleaning and inspection department can deliver to the head of any other department accurate advice regarding any maintenance work, including cleaning and repairing, which has been carried out on any or all cars. It may be said that such a requirement is too broad. If this criticism were made it would be because the immediate value of the system of reports necessary was not at once realized.

A system of complete reports is, however, worth the comparatively slight additional expense required for its preparation. The elaborateness of the records that may be kept should, of course, be adjusted to the property and operating organization. With the records available showing the nature of all repairs made on cars, and the dates when these repairs or clear inspections were made, and also when, by the use of these same records, it is possible to determine accurately what employe was responsible for any detail of the work, the operating company is in a far better position, not only to perfect and thereby reduce the proportionate cost of its cleaning and inspection department, but also to go into court on any damage suit with a statement, verified and sworn to, of the exact condition of the rolling stock at the time any accident may have occurred. The assertion that these results are valuable to an operating company needs no confirmation.

Again, when employes know that every part of the work which they perform is entered in a permanent record, the results of the work surely must be better than when it is known that after any particular job has been accepted by the foreman, all responsibility for the men doing the work ceases.

Granting that a well-kept system of records would thus increase the efficiency of the men, the results to the company are twofold. First, there is an inspiration for the men to do good work, and any man who desires to do good work will also be industrious. Therefore the company realizes the maximum value of the money spent for wages. The second result of benefit to the company is realized in the reduction of the number of car pull-ins. One of the fundamental requirements for economical operation is that the cars, representing as they do a considerable investmeut, be kept in active service for the greatest possible number of hours during their life. To do this requires two things: (1) The repair work and inspection must be so thoroughly done that the number of pull-ins will approach the lowest consistent limit. (2) When it is necessary to make a repair on a disabled rolling stock equipment, those parts of the equipment which are in operable condition should be returned to service with the least possible delay.

These are the fundamental principles on which the car cleaning and inspection department of any electric railway may safely be founded. How thoroughly the Chicago City Railway Company adheres to the central idea just suggested may be learned in detail from an article presented elsewhere in this issue.

Strict adherence to a systematic plan of car inspection and cleaning is a fundamental requirement observed by the Chicago City Railway Company. To illustrate: The cars, whether for cleaning, inspection or light repair work, are all received at the same end of the car house buildings. Each car, unless otherwise required by some special repair work, is spotted on the same track in the same bay each time it is run through the car house. When a car is turned in at the rear of the car house it immediately is taken in hand by cleaners and repair men, each of which groups successively performs its duties, and passes the car along toward the forward end of the car house, where it receives final inspection and has its trolley pulled down to indicate that it is ready for any service to which the transportation department may desire to put it.

Combined with the very thorough cleaning and inspection practices as followed out at the car houses is the recently installed practice of terminal inspection and cleaning. We do not recall that this system of cleaning and inspection is used by any other railway. The methods are said to have been found both economical and practical. Each car as it approaches an outlying terminal is met by a cleaner and inspector, who sweeps the floors and makes any light repairs that may be called to his attention by the car crews. The repair men are provided with a supply of small parts so that even under comparatively severe service conditions they can make repairs which will permit the cars to be safely operated throughout the runs and thereby save the company the expense of replacing them with cars from storage.

The value of clean cars and the character of the impression they leave on the mind of the traveling public is too well known to require emphasis here. With the system of terminal cleaning each car is swept as well as inspected on each round trip. The results are a better feeling toward the company on the part of those passengers who appreciate clean cars and a substantial reduction in pull-ins due to the availability of repair men at outlying terminals. The system of records exhibits accurate evidence of each detail as it is completed.

OVERHAULING CARS FOR STORAGE.

In a few weeks the approach of warm weather will necessitate the setting aside of box cars on many systems in northern climates and if sufficient care is taken to put the closed equipments in good condition at an early period we predict that many troubles will be avoided in the late fall. It is a widely accepted custom on roads that use both open and closed cars to make general repairs during the off season for each type of rolling stock. Therefore it is well to have definitely in mind the exact kind of defects to look for in preparing to overhaul box cars for summer storage.

Wood in truck frames tends to decay under the exposure to water and temperature changes and often needs renewal. Holes in brakebeams tend to wear oblong, calling for new beams in the best practice. Holes in levers also tend to get worn. If journal boxes have not been cleaned out and the felt wicking has become glazed, preventing the oil from reaching the bearing, it is good practice to renew the boxes or clean them by soaking in kerosene.

An important point to observe in handling bearings is to mark them when they are taken from the boxes, as many hot boxes are caused by shifting the bearings after they have become properly seated to their axles. An arrangement of lockers was provided in one shop in which the bearings were kept. They were numbered the same as the journals. When an axle was taken out of service the corresponding journals were put in a certain locker and kept there until the axle went back in service again. This at once reduced the number of hot boxes 90 per cent, and the cost of doing the work was nominal.

Before a car goes back into service the trolley adjustment is one of the most important things to make sure of and one

which is often overlooked by inspectors. If the trolley contact springs are not kept in good condition to carry current from wheel to pole, independent of the spindle, the result is likely to be worn and burned trolleys, spindles and bushings and burned cotter pins. The latter lead to losses of wheels or parts on the street—small matters from the expense point of view, but very annoying in relation to service interruptions.

Whether the repairs on the closed cars are to be made at once or later in the warm season, it is an advantage to prepare lists as soon as possible at different car houses of the materials needed in the work in sight. Otherwise the stores department is likely to be overloaded with a rush of requisitions later in the season and often at a time when orders cannot be rapidly filled. The farther a road gets from the factories the more necessary it is to keep a large stock of spare parts on hand, and if orders for these are placed early the deliveries stand a much better chance of enabling the work to be done in time for the opening of traffic with the closed cars in the fall. Only a careful system of life records of equipment parts will, with large allowances for late deliveries, serve as a basis for approximate estimates of the supplies needed.

ANNUAL REPORTS.

West Jersey & Seashore Railroad.

Operating expenses of the West Jersey & Seashore Railroad, the electrified division of the Pennsylvania system, aggregated 78.27 per cent of gross earnings in 1907, as compared with 76 per cent in the previous year. As a result of the increase in expenses, which was due principally to the greater cost of conducting transportation, the net earnings from operation in 1907 were less than in 1906. Figures for the two years compare as follows:

	1907.	1906.	Increase.
Miles of road	363	358	5
Gross earnings	$5,654,904	$5,206,284	$448,620
Operating expenses	4,426,040	3,956,914	469,126
Net earnings	$1,228,864	$1,349,370	*$20,506
Other income	79,193	40,086	39,107
Total net income	$1,308,057	$1,289,456	$ 18,601
Charges, taxes, rentals, etc.	652,863	491,808	161,055
Net divisible income	$ 655,194	$ 797,648	*$142,454
Dividends	578,496	475,704	102,792
Surplus	$ 76,698	$ 321,944	$245,246

*Decrease.

The proportion of the gross earnings contributed by the passenger traffic was substantially the same as in the previous year, being in each instance 63.9 per cent.

Conducting transportation costs amounted to $2,626,186 in 1907, or 46.6 per cent of gross earnings, as compared with $2,256,366 in 1906, or 43.3 per cent of gross earnings. The total maintenance expenditures during 1907 were $1,550,868, as compared with $1,485,452 in 1906.

From the surplus for 1907, shown in the foregoing table, there were deducted $52,973 for sinking fund requirements and $8,890 on account of maturing car trusts and guaranteed dividends. From the profit and loss surplus accumulated in previous years there was taken $106,523, mainly for settlement of accident claims on account of liabilities of preceding years.

The passenger traffic increased in a greater ratio than the earnings therefrom. The number of passengers carried was 8,512,958, a gain of 16 per cent. The passenger train mileage increased 17 per cent. More favorable results were shown in the freight department. With an increase in the number of ton-miles of 15 per cent and in the total tonnage of over 10 per cent there was an increase in freight revenue of 16.7 per cent.

The charges to property account during the year aggregated $2,177,878, and are set forth in detail. James McCrea the president, discusses the important improvements made during the last few years. In order to provide for and protect the increasing traffic, and particularly the seashore business, it was deemed wise in 1905 to add extensively to facilities. Plans formed at that time comprised the double-tracking and electrification of the line from Camden via Newfield to Atlantic City, and also electrification from Newfield to Vineland and Millville; the improvement of the road between Camden and Cape May and other seaside resorts south of Ocean City and the separation of steam from electric service by using for steam trains the Camden and Atlantic road to Winslow Junction, and, from that point jointly with the Philadelphia & Reading Railway, the road to Woodbine; the construction of a freight cut-off between Westville and Haddonfield, permitting the carrying of freight around Camden; and the elimination of grade crossings in Camden. Additional equipment and other improvements were also needed. Under an agreement made by the company in 1904 it paid to Atlantic City during the last year $150,000 toward the cost of paving Atlantic avenue and expended $366,927 in regrading and relaying the tracks of the company on that avenue. To meet the cost of these improvements and of changes in the terminal at Camden, involving altogether about $9,300,000, there were issued $4,689,550 capital stock and $2,061,000 consolidated mortgage bonds. The sums required beyond the proceeds of these securities have been advanced temporarily by the Pennsylvania Railroad, but $1,000,000 more will be needed during 1908 to make the improvements of proper utility and to provide additional facilities.

After referring to the reduction in the dividend from the basis of 6 per cent to 4 per cent per annum Mr. McCrea states that, judging by past experience and the business which is being developed by electric service and improved facilities, it is hoped that the expenditures for protection and development of the increase in traffic will produce in the near future increases in the net revenues. Trackage rights have been given by the company to the Atlantic City & Shore Railroad on Atlantic avenue, Atlantic City, and to Longport, with the use of the steamboat lines from the latter point to Ocean City. The West Jersey & Seashore road receives a fixed rental under the agreement for this joint use of its property and also shares in the increased revenues resulting from the development of the territory.

Traffic statistics for two years make the following comparison:

	1907.	1906.	Increase.
Passenger-miles	252,388,770	214,464,347	37,924,423
Passenger-mile revenue, cts.	1.312	1.337	*0.025
Pass. train-mile earnings	$1.099	$1.212	*$0.113
Ton-miles	76,901,514	66,972,628	9,928,886
Ton-mile revenue, cents	2.195	2.160	0.035
Freight train-mile earnings	$2.949	$2.727	$0.222

*Decrease.

Power Improvements at Jacksonville.

The Stone & Webster Engineering Corporation has nearly completed the installation of additional power house equipment for the Jacksonville Electric Company. This work has included the installation of an 800-kilowatt General Electric railway generator direct connected to a 24 by 48 by 48 inch horizontal cross-compound condensing Rice & Sargent engine. The boiler capacity has been increased by the addition of a 520-horsepower Aultman & Taylor water tube boiler, and a new 2,500-horsepower self-supporting steel stack, together with flues connecting it with present and new boilers, has been erected. The old steel stack, which had become inadequate, has been removed and a barometric condenser with necessary circulating and dry vacuum pumps has been installed in its former location. The new condenser is of sufficient capacity to condense steam from two 800-kilowatt units.

Communications

CLASSIFICATION—DIFFICULTY OF APPLICATION TO COMPANIES OPERATING SEVERAL CLASSES OF PUBLIC UTILITIES.

To the Editors:

I do not believe that a road with small gross receipts can adopt the classification on account of the heavy expense required by the number of accounts and the necessary number of forms.

In roads or systems that can afford the expense I believe that even then the division of expenses under 116 primary accounts would be top-heavy and cumbersome. The proper curtailment of this very voluminous classification should receive very earnest and serious consideration.

We are dealing now with a classification of accounts that will be permanent, until further amplified by the accession of other public utility corporations, and due care should be exercised if we are not to be carried away by dealing with minutiæ. If these details could be carried out by ourselves as individuals they would probably work out some generally good results, but we are dependent for our information as to the actual use of supplies and the employment of labor upon the superintendents, foremen and others in charge, and if the classification is made burdensome to them it will most surely lack the attention it deserves and will therefore be unsatisfactory and of no value.

For instance, consider primary account No. 44, "other than railway operation—cr.," under subgeneral account F, general account 1. In a system operating an electric light and commercial power plant in connection with railway power, where there is an income from the sale of light and power, the tentative classification conveys the idea that further separate accounts should be kept, and that the expense in this connection should be charged against gross income directly, and the primary account should show a credit on account of certain expenses. How is it possible to determine the cost or expense for the service for light and power sales with the almost innumerable charges in connection with account No. 44, when all the machines are in one building, and still expect to receive anything like a correct report from those in charge of the building? If a new plank was necessary for the floor or new panes of glass were needed for the windows, is it possible to know accurately what proportion of these two expenses should be charged to account No. 44, for the light and power service, respectively? It seems to me that account No. 44 is unnecessary, as it is fully covered by primary account No. 26, "power generating plant buildings." Other accounts could also be eliminated and the primary accounts brought down to a number within reason, and with something of the expectancy of accuracy.

On the other hand, I do not see where provision has been made in this voluminous classification for certain important accounts, such as "maintenance of ferry boats," as well as for the operation of ferry boats.

Charges to both of these accounts amount to large sums annually.

I do not think it is wise or good business to attempt to apportion the injury and damages accounts, insurance and store expenses. They are best treated and understood when classified under general expenses.

In the treatment of "depreciation" I do not see where it should enter into the cost of operation of the property. Maintenance is an operating charge, because it means holding or keeping the property in a particular state or condition. "Depreciation" should be a charge against net income, because it means that the property has lessened in value. A certain defined percentage should be set aside annually from net income to provide for the generally lessened value of the property, which it is not possible for even the strictest method of maintenance to overcome.

The company with which I am associated operates a railway plant, a gas plant, an electric light and power plant and a combination ferry and railway plant connecting seashore resorts, so that while I am interested in interurban railway accounting, I am as much interested in the accounting for electric light and commercial power and gas plants, and each one is more or less of a proposition in itself. In addition to these there are to be dealt with water companies, heating companies, the interstate and state commissions and the United States bureau of census. It therefore seems to me that a general committee composed of members of these several associations and bureaus should meet and determine upon such a classification of accounts as will best serve the interests of investors. This agitation concerning interurban and street railway accounting is simply a forerunner of a combination system of accounting of other public utility corporations and it seems to me that while the matter is under discussion it would be just as well to consider the accounting of gas, electric light and commercial power, water and heating properties in connection with the railway interests, and adopt such classification as will best serve all interests involved—the investor, the accountant, the interstate and state commissions and the bureau of census of the United States.

PINCKNEY J. BALAGUER,
Secretary and Auditor Charleston Consolidated Railway Gas & Electric Company.

Charleston, S. C., March 27, 1908.

CLASSIFICATION—PAST STATISTICS RENDERED USELESS.

To the Editors:

Inasmuch as there are to be separate accounts for steam and electric roads why not continue the present classifications of the American Street and Interurban Railway Accountants' Association, which have been in service for eight years or over? Any railroad that wishes more detail than those provide can add as many subaccounts to the present classifications as will answer the purpose. If a few new accounts must be used to keep up with the development of the traction business they can be added by placing letters after the nearest accounts or using half numbers. This practically would not change the present classifications and would not render the statistical work of the past several years useless for comparison with the results of the coming years. I think the tentative classifications go too far into detail for roads the annual receipts of which are not $300,000, and that they would necessitate the employment of extra help in each of the different departments to make the distribution of the accounts.

E. L. SCHMOCK,
Assistant Secretary Cleveland Painesville & Eastern Railroad.

Willoughby, O., March 23, 1908.

CLASSIFICATION—REVISION NEEDED.

To the Editors:

I am of the belief that the interstate commerce commission will not press the adoption of the classification of operating expenses but will consent to a number of changes which will doubtless be urgently submitted by a majority of the operating roads in their replies to Circular No. 20.

It seems almost unfair for the commission to impose on the operating roads the necessity of furnishing it with certain detailed statistics which would be secured for no other purpose and, if provided at all, could be but the result of a burdensome task. There appear in the classification a number of primary accounts which would not accurately convey the information desired. Such accounts deal with minor matters of accounting which are not required or desired by the officials

of most roads, especially when the cost of securing the data is considered in connection with the very slight advantage of having the information. This detailed information would necessitate excessive clerical work and, even with the application of the most careful thought in the distribution of charges, the accounts in most instances would not represent reliably the totals properly chargeable to them. It is doubtless true that a number of these accounts would portray to the officials of the roads and the commission results practically estimated or guessed at, and it is my belief that the commission will be convinced of this fact, and as a result revise the classification.

IRA E. GUTHRIE,

Auditor Indianapolis Columbus & Southern Traction Company.

Columbus, Ind., March 28, 1908.

PAT AND THE NEW ACCOUNTING—WITH APOLOGIES TO MR. DOOLEY.

BY PAT'S EMPLOYER.

Pat (the lineman): "Well, Bill, Oi've jist ashked fur a job as sicshun hand."

Bill (the motorman): "Fur why was that now, Pat? Are ye sacked?"

Pat: "Sacked! Naw; but the boss wants t' make a damned bukkeeper of me."

Bill: "A foine bukkeeper ye'd make with them fists o' yourn. What's the joke?"

Pat: "It's in sober earnest I am. It's loike this: He calls me in, nice and friendly loike, and he says: 'Pat,' says he. 'Pat, some fules doon in Washin'ton have made an ordher that your pay must be subdivoided.'

"'Ye're not fur cuttin' me pay?' says I.

"'No, no, Pat,' says he. 'Jist fur keepin' thrack of it and the toime ye put in so's t' 'count fur it loike.'

"'Verry well, sur,' says Oi, 'so long's it's not fur cuttin' Oi can shtand it.'

"With that he brings out a noice new toime buk loike's used by a toimekeeper on a thrack gang, but bigger, and shtarts in t' explain t' me: 'It's loike thish, ye see, Pat. Ye're gettin' a hunder a month—that's three somethin' in Janiery, March, and'—I misremimber the other munths he named—'and three somethin' else in Apreel and'—a lot more, and—'three somethin' else in Fibrooary.' I remimber that Fibrooary was all alone excipt that he sed it was diff'runt this year, but we wudn't count that.

"'Now, Pat,' says he, 'Oi've laid it all out fur ye in this buk and ye're t' divoide oop the wurruk ye do ivery day betwixt the diffrunt accounts.'

"'But, mither of Moses!' says Oi, 'Oi'm not wurkin' all day, sur,' says Oi. 'Mosht iv me toime is spint roidin' tu a job, an' frum a job an' inshpectin' th' loine,' says Oi.

"'Niver moid that,' says he. 'Ye'll have t' eshtimate ut.'

"'Eshtimate ut! An' what's that?' says Oi.

"'Guess at it,' says he, sort-a-mad loike; an' thin he opens the buk and shows ut t' me all noicely rhuled up an' down an' chris-chros, an' procheeds t' explain. Ut seems Oi'm doin' a lot of diffrunt things t' wanst.

"'Ye see, ut's rhuled across th' top,' says he, 'intu twinty-wan columes, manin' twinty-wan diffrunt jobs. On top iv each colume is a number denotin' the koind iv job, an' in frunt here Oi've had printed the koind iv job oppisit the number, so's ye can refer to ut. Now,' says he, 'if ye're fixin' a lamp in a switchstand ye must put down ye're toime in the furst colume with a foive over ut, but uf ye're puttin' a new lamp in moi offis here ye put it down in this lasht colume under a hunder an' ate.'

"An' he wint on fur 'bout fifteen minits exshplainin', as he called ut, all what Oi was t' du when Oi dhruv a cow off the rhoit uv whay an' chlosed th' gate on her, an' what Oi wus t' du whin Oi was ridin' on a car Inshpectin' th' loine, how much wus t' go t' this woire an' how much t' that wan, until Oi shtopped him by ashkin' where wus me runnin' mate, Moike.

"'Oi've jist put him on practisin' motorman,' says he.

"'Thin git a college purfeshur fur this job an' put me in a sicshun gang,' says Oi—an' out Oi cum."

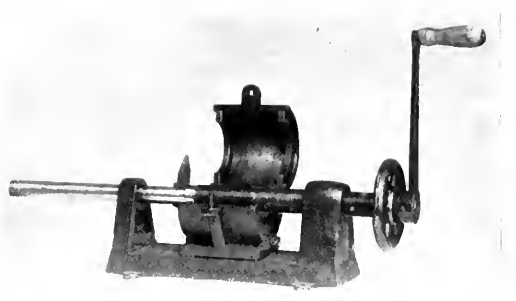
Note.—Pat was somewhat short in his count or the book was too small. Twenty-one accounts would not cover Pat's multifarious duties.

HAND LATHE FOR ARMATURE BOXES.

BY E. D. COLBURN.

The accompanying halftone engraving illustrates a machine which was designed by the writer for turning armature boxes and axle bearings for railway motors in the shops of the Dayton Covington & Piqua Traction Company at West Milton, O. We found that the armature shafts, after being used for a short time, showed some wear, and as no two armature shafts wore down to the same size we had to make the box to fit each individual shaft. This necessitated considerable expense and labor, which, after five years of service, the machine herewith illustrated has reduced very appreciably.

The illustration shows the machine with the self-centering jig for holding the boxes to be turned wide open, in position to



Hand-Driven Lathe for Boring Armature Boxes.

insert the box. This inserting is done by taking the center out of the arbor and pushing the arbor back through the feed screw until there is room enough to insert the box. The cover is then clamped down, the arbor pushed back and the cutter put in place. By means of different sized rings which are placed in grooves inside the jig the machine will hold any size of box. We used a different shaped cutter for facing off the ends of the box.

Since using this device we have had no trouble from boxes not being truly centered and in 15 minutes a G.E.-67 armature bearing can be put into the machine and turned to fit any armature. A box also can be turned in less time than with a lathe, and, on a road having no regular machine shop, such a simple method becomes almost a necessity by reason of the expense of labor, loss of time and cartage charges incurred when a box must be sent away to be turned. The labor charges alone represent a cost of from 50 to 60 cents an hour when the work is done outside, while with this machine one man who is paid 20 cents an hour can do the work in almost the same time he would use in taking measurements ready to send away with the box to be turned. As a further saving in time we always keep our old shells babbitted ready to be turned at any time.

The new stock yards branch of the South Side Elevated Railroad, Chicago, will be opened for traffic in a few days.

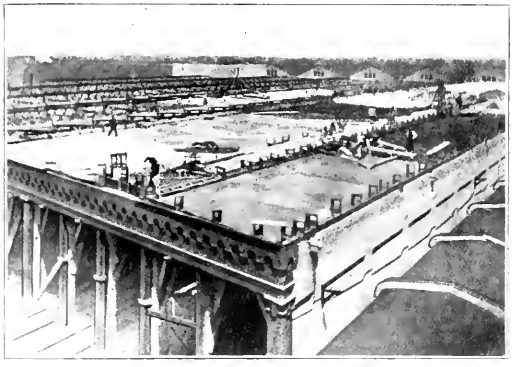
CAR CLEANING AND INSPECTION—CHICAGO CITY RAILWAY.

The methods of inspection, making light repairs and car cleaning as practiced by the Chicago City Railway Company at its car houses located at Seventy-seventh street and Vincennes road are typical of the work at the other five car houses of this company.

Before describing in full the practices in the car cleaning and inspection work of the Chicago City Railway Company it seems best to outline the general idea upon which the various details of the work are based.

A system of records of a thorough yet simple nature has been established. These records are not complicated and little clerical work is required in their keeping. As a result the company has available at all times records comprising an accurate statement of all the repairs that have been made on any car before it was put into service on any date. In other words, it is possible by referring to the records to learn the location and condition of every car housed on every date. Similarly the records show when the car has been cleaned and inspected and what were the repairs made, if any, on any date.

With regard to the repair work, the system of handling the cars in the car houses and shops has been formulated with a



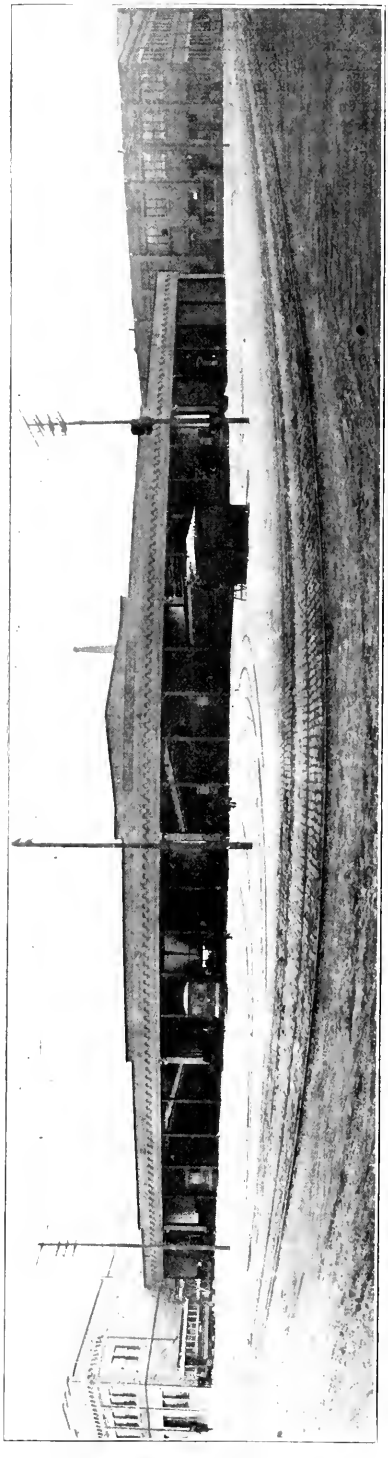
Chicago City Railway—Roof of Car House During Construction.

view to keeping as much as possible of the capital invested in cars in operating service for the maximum time. Briefly this is effected by having available at the car houses supplementary parts with which a damaged equipment can be put into operable condition by the simple process of replacing the damaged parts. For instance, if a truck is damaged it is the plan to save the car as a capital investment by placing the body on new trucks at once and thus putting it back into service where it has an earning value.

Buildings.

The new Seventy-seventh street building comprises six bays, each with five tracks extending through from end to end. The average length of each of these covered tracks is such that it will accommodate 10 of the company's large double-truck cars. Immediately at the rear and in line with the new building, but separated from it by a paved concourse 66 feet wide, is a similar car house, also having six bays, with five through tracks in each bay. This rear car house is long enough to accommodate seven cars on each of its 30 tracks. The total housing capacity at this location is about 600 cars.

Rolling steel doors of Kinnear manufacture serve to close the ends of each bay of the car houses. The track arrangement is such that cars may be received at the rear end of the rear car house, passed through the rear building, across the concourse and through the new car house to the street on



Chicago City Railway—Panoramic View of Division Headquarters (Left), New Car House (Center) and Machine Shop (Right) Fronting on Vincennes Road, Between Seventy-seventh and Seventy-eighth Streets.

Chicago City Railway—Interior View of One Bay in New Car House.

any one of the 30 tracks. Illustrations on pages 411 and 414 exhibit the general dimensions of the Seventy-seventh street car house, illustrate its type of fireproof construction and show its relation to the nearby shop buildings.

The second story of the north bay at the rear has been especially designed for the accommodation of the car house employes. The space is divided into a locker room fitted with pressed steel lockers, a toilet room and a general room. Tables and benches have been placed in the latter room, making it an attractive place for the men at lunch time. The car house foreman's office is partitioned off from one corner of this general room. A Dey time clock, as used at each car house, is placed in the large lunch room near the locker room. At the front of this north bay are accommodations for the division headquarters of the transportation department.

The car houses are illuminated by inclosed arc lamps having silvered glass reflectors. Pit lighting is done with incandescent globes. All wiring and power cables are carried in iron conduit with metal outlets, the circuits for each bay

being sectionalized. Along the pits are socket connections so that extension plugs with lamps may be used for inspection purposes wherever desired.

Fireproof rooms on the ground floor along the north bay house the car house supplies. The stock kept here is drawn on requisition from the main shop storeroom. An attendant at the car house stock room issues supplies only as needed for each repair job.

Car Placing.

After the cars have completed their runs they are received at the rear of the car house. Loop tracks inclose the car houses and shops, so that as cars are taken off from the street they can easily be run around the south side of the buildings and onto any one of the 30 car house tracks.

Inasmuch as a large special work layout is required to serve the 30 tracks, and because derailments will happen when cars are received as fast as on a 45-second headway, the approaches to the car houses have been paved with granite blocks placed at the level of the rail heads. With the approaches to the car houses paved no jacking-up is necessary to replace a derailed car. Accompanying engravings reproduced from photographs show the neat appearance of the paved track outside of the car house doors. The regular car crews deliver their cars to the three car placers, who are on duty at the rear of the car house day and night. The plan is pursued of always placing the same cars in the same bays, and thus the car placers direct the spotting of the cars as they finish their schedules. The placers receive from the motormen verbal advice regarding the condition of the cars as they are turned in.

To provide a handy form for recording the defects as verbally reported by the motorman each car placer is furnished with a blank form known as a "car placer's record." Such forms are printed on white paper 8 inches wide by 8½ inches high and have headings as illustrated in one of the accompanying engravings. It is noted that this blank when filled will exhibit the car numbers, date and the individual numbers of the equipments spotted on each of the 10 tracks in a certain two of the bays. Spaces are ruled at the bottom of the blank for the car placer's signature and on the reverse side columns and lines are ruled so that the placer can quickly note the numbers of the defective cars and opposite each number jot down the nature of any defect reported. This verbal reporting of defects as noted on these blanks is used to check the formal report made on the signing-in sheet.

The system of assigning certain cars to the same track each time they are run in serves to avoid confusion on the part of both the repair men when looking for cars to be repaired or inspected, and for trainmen when looking for cars to take out on their runs.

Car Cleaning.

The work of cleaning, inspection and repairing is arranged to be carried on progressively, the car meanwhile passing through the car houses from rear to front. As a car enters the rear of the car house it is met by cleaners, who first sweep the floor and the platforms. All cars are swept and dusted each time they are turned in from service; the bodies are cleaned only when the cars are turned in for the day. The daily cleaning comprises washing the panels and windows with warm water, scrubbing floors and platforms and wiping the interior woodwork with cheesecloth. The floors are scrubbed with hot water to which a cleaner and disinfectant are added. At intervals of once a week each car is disinfected, except those cars operating through the stockyards district, which are disinfected twice each week. The disinfectant is applied to the interior of the cars with an atomizer. The proportions used are one gill of disinfectant to each bucket of water.

At intervals of from 60 to 70 days the outsides of the car bodies are scrubbed with Imperial car cleaner. This not only renews the life of the varnish, but brings out the original colors. At intervals of six months the interiors are thoroughly renovated and the woodwork is cleaned with a special mixture of the Imperial cleaner.

At each car house a car cleaning record book is kept by the foreman. The pages of this book are 6 by 9⅜ inches,

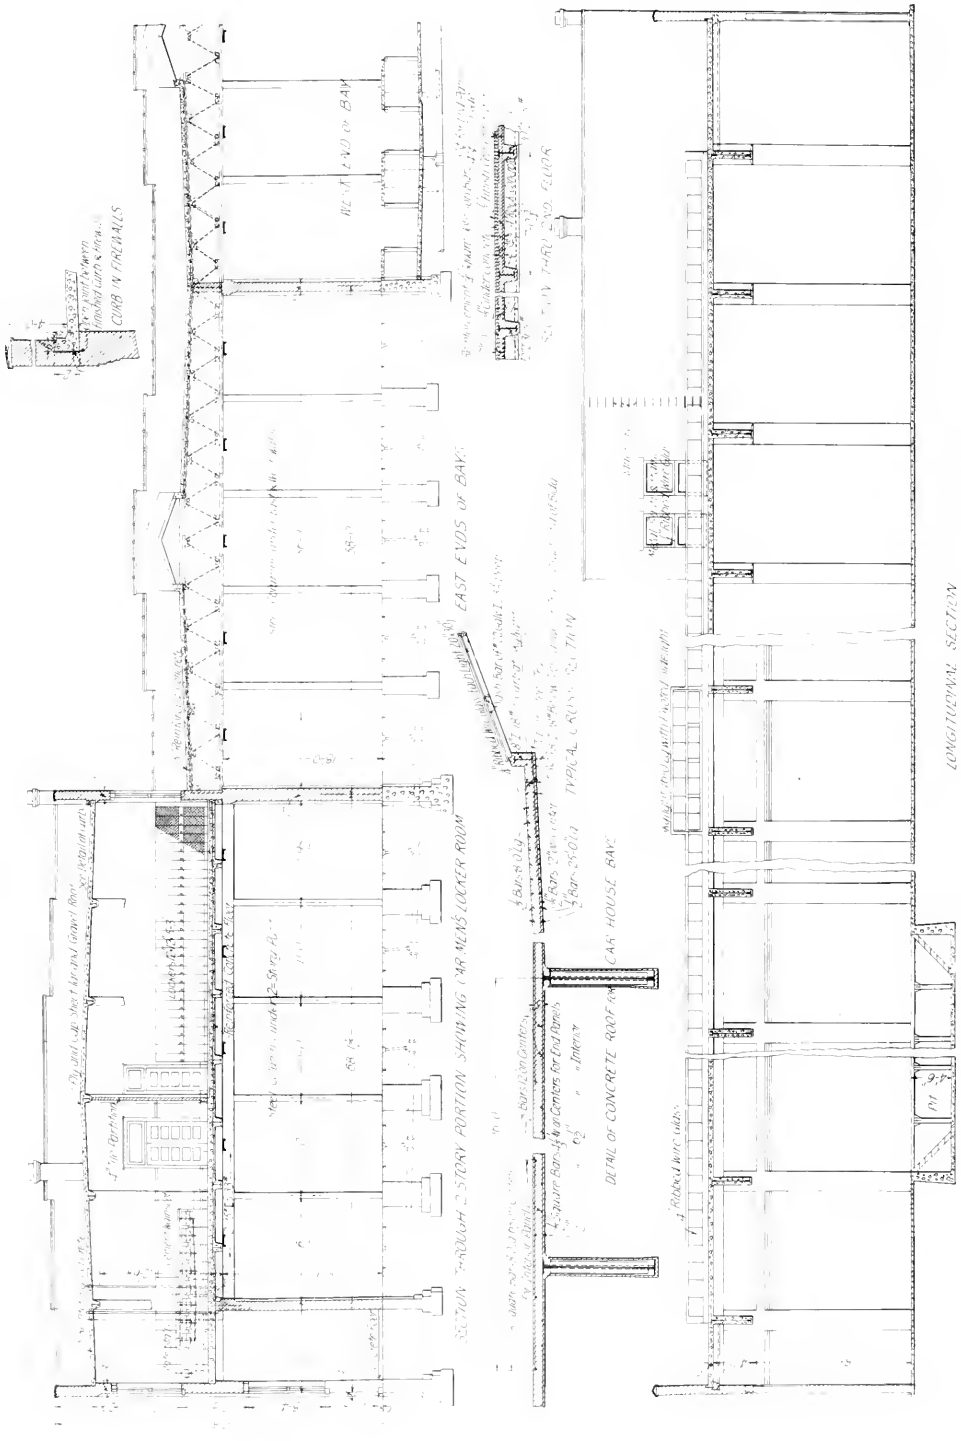
ruled with horizontal lines in blue, at the left of which is a complete list of all cars housed, and vertical columns numbered for the 31 days of a month. By the use of a set of symbols illustrated in the accompanying key, the car foreman can, with a small amount of clerical work, keep a permanent record of the character of work done on each car every day. This very simple record scheme is also used to keep account of the repair work and the method is more fully described under that subject.

Inspection.

As a car is being cleaned the inspectors also work on it, so that as soon as it is in good shape it can be moved along



Chicago City Railway—Cross and Longitudinal Sections of New Car House.

to make room for another. While over the pits the cars receive a very thorough inspection and all light repairs are immediately made. The inspection force is divided up into six gangs of two men each, with work classified as follows: Trolleys, brakes, controllers, brake rigging and wheels, motors and bodies. The gangs are assigned to individual tracks, so that each takes a line of cars and inspects it progressively. In this way, as a car has been cleaned and then inspected, it can be passed along toward the front of the car house, where it later will receive the finishing touches, and then be moved up to the front, ready to go out in service.

The inspection over the pits is carried out on each car very thoroughly once a day. The air brakes are operated by the inspection men, the shoes and piston travel are inspected and adjusted if necessary, and if it is found necessary to replace brakeshoes this is done and the adjustment then made. Each air tank is bled every night and, as there are two tanks to each car, practically no trouble is occasioned from condensation. The motors are looked over very carefully and all journals on the car are "felt," irrespective of whether or not they are freshly oiled. Each night the inspectors of the mechanical department test the air sanders to see that they

THIS REPORT, SHOWING CONDITION OF ALL CARS USED IN PASSENGER SERVICE, MUST BE MADE DAILY; PROPER NOTATION SHOWING THAT CARS HAVE BEEN "REPAIRED," "HELD IN" OR SENT "TO SHOPS" SHOULD BE NOTED THEREON BY CAR HOUSE FOREMAN, WHOSE SIGNATURE MUST BE THEN AFFIXED. REPORT WILL THEN BE CAREFULLY CHECKED OVER BY ASSISTANT MASTER MECHANIC, WHO WILL FORWARD SAME TO MASTER MECHANIC, WHO WILL CERTIFY TO THE CORRECTNESS OF THE SAME AND PASS TO CLAIM DEPARTMENT FOR PERMANENT FILE.

Chicago City Railway—Motorman's Daily Signing-In Sheet, on Which He Notes Condition of His Car.

are not clogged, and again as the car is taken out the motorman fills the box and tests the discharge, so that the responsibility for the sander being in operative condition rests with the motorman himself.

As the inspectors complete their work on a car it is moved along toward the front of the car house. Here such light work as replacing windows, inspecting and replacing lights, testing bell circuits, sliding steps, fenders, etc., is carried on. The bells on each car are rung every day. Two shifts of one man each test and make minor repairs on the bell circuits.

The men making the minor repairs on the cars act as secondary inspectors and advise their foreman of any defects noted. As soon as the final cleaning and repairing are completed the car is moved as far as possible toward the front end of the car house, the lights are turned out and the trolley pole is pulled down, thus indicating that the car is ready for service. In cold weather, however, the trolley is put on the wire and the heaters are turned on one point for an hour or an hour and a half before any car goes into service.

Car House Records.

The car placer's record, by means of which the motorman reports verbally any defect noted in his equipment, has been described. Following this record is a complete chain of blank forms by means of which it is possible to learn the location and condition of every car owned by the Chicago City Railway and ascertain definitely the nature of the cleaning, inspection and repair work done on any car on any day. The system of blank forms is not complicated, and but a comparatively small amount of clerical work is required to keep these complete and desirable records.

After a motorman has turned in his car to one of the car placers he goes to the division headquarters at the corner of the car house and there fills in the information required by a so-called "motorman's daily signing-in sheet." These sheets, which are kept in frames with only those portions exposed which are to be used by the motormen, are 11¾ inches wide by 16¾ inches long and have headings ruled as shown in the accompanying illustration. It will be noted that the motorman is required to indicate on a sheet the time at which the car was turned in, the car number and the nature of the defects or breakages, if any exist (otherwise indicate good condition by an "O. K.") on the car when turned in, and affix his signature, thus certifying to the correctness of this defect report. An additional column at the right of the report is ruled for the use of the car house foreman. Here he indicates the action taken with regard to the defects reported by the motorman. Thus in this column opposite a reported defect he states whether the car was repaired, held in or sent to the shops. In the frames in which these signing-in sheets are fastened this latter "foreman's" column is covered by a strip of wood so that it may not be touched by the motorman. At the bottom of the blank form are signing spaces for the assistant master mechanic and the car house foreman. Beneath the signatures is the following statement:

"This report, showing condition of all cars used in passenger service, must be made daily; proper notation showing that cars have been 'repaired,' 'held in' or sent 'to shops' should be noted thereon by car house foreman, whose signature must be then affixed. Report will then be carefully checked over by assistant master mechanic, who will forward same to master mechanic, who will certify to the correctness of the same and pass to claim department for permanent file."

Daily Repair Sheet.

The foreman of the car house keeps close watch of these signing-in sheets, checking them with the verbal defect reports received by the car placers. He transfers any defect reports made by a motorman to a large "daily record of car repairs." This record sheet kept at one side of the car

house, is readily accessible at all times. The so-called "daily record of car repairs" is printed on a sheet 21½ inches wide by 26 inches high. At the top appears a heading in which is written the name of the car house at which the particular sheet is used, together with the date on which it was used. The ruling of the sheet is simple. Down the left-hand side are listed, one on each line running across the page, the parts of a car most frequently requiring attention. This list follows: Air canopies, controllers, curtains, doors, engineers' valves, electric bells, fenders, fuse boxes, floors, glass, grab handles, gongs, headlights, heaters, hot journals, lights, motors, register cords, resistance, sashes, sander, seats, signal

bell, steps, signs, trucks, truck fenders, trolley, ventilators, wheels, wiring.

It will be noted that this list of parts is arranged alphabetically, so that no time need be lost in referring to any division of the list. Columns are ruled up and down the car repair record, so that opposite each one of the parts as listed are nine clearly separated blank spaces. In each of these spaces two sections are set off for recording the car number and the payroll number of each man who makes the repairs noted on the same line.

As the car house foreman inspects the motormen's signing-in sheets he transfers to this "daily record of car repairs" the numbers of the cars on which defects occur, placing these numbers on the daily record of car repairs opposite the defective part as listed in the left-hand column. In this way the daily record of car repairs at each car house automatically distributes the work for the repair men, who go to the large record and take off the numbers of the cars which are defective in the parts for which these men are responsible.

Thus the overseeing work of the general foreman is not interfered with by his being called upon to assign jobs to the various subforemen and gangs. As defects are repaired the payroll number of the man making the repairs is placed opposite the proper car number on the large sheet and thus there is exhibited a permanent record of the amount and nature of the work done by the inspection and repair men each day; and there is also afforded a means for ascertaining which man is responsible for any particular repair made. When any defects scheduled on the daily report are not repaired on the same day the car number is transferred to the daily car repair record for the day following.

Repairer's Report and Held-In Slip.

To assist the men in taking off their assignments from the large daily record of car repairs and as a further check on the responsibility for each job, a "repairer's report" is used, 5 by 8½ inches in size. Onto one of these sheets each man transfers from the large record the numbers of the cars having any defects which it is his duty to repair. After the work as exhibited on this repairer's report has been done, he signs his name at the bottom and also his payroll number. When thus completed the blank shows the repair work done in one day by one man. The various men using this report are those assigned to work on car bodies, motors, trolleys, air brakes, controllers, trucks, wheels and brake rigging. If the nature of the difficulty assigned to any man is such that it cannot be repaired on the same day he notifies the foreman, who fills in a "held-in" slip.

This held-in slip is used by the foreman to inform the assistant master mechanic and later the claim department of the nature of defects to each car and the time when the repairs on that car were made, so that it could be returned to service. This blank form, which is 9⅜ by 4⅞ inches in size, is also illustrated.

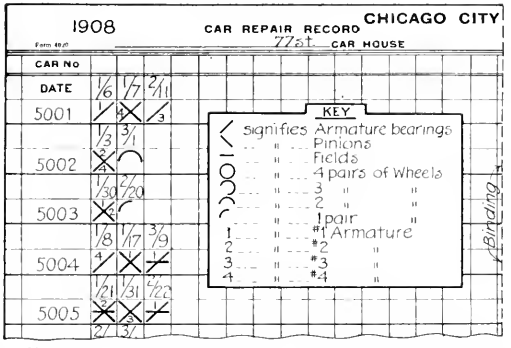
Chicago City Railway—Daily Car Repair Record Sheet on Which the Numbers of Cars to be Repaired are Distributed.

Shopping Slip and Foreman's Report.

When it becomes necessary to send a car to the shops the car house foreman makes out a blank of the accompanying form, which is sent to the repair shop with the car. As the repairs are completed the information called for on the back of the blank is filled in in the office of the master mechanic, including the time and number of the car as it is

returned to service. If the damage requiring the shopping of the car has been occasioned by accident, there are entered on the back of this shopping report the expense for labor and materials required in making the repairs. These blank forms, which the foremen use for reporting cars sent to the shops for repairs, are 8½ by 4½ inches in size and are ruled as shown in the accompanying illustration.

The daily report of the car house foreman, which is illustrated in part, is 8⅜ by 11½ inches in size, and is used to inform the assistant master mechanic of the total number of cars housed, held in, pulled in or sent to the shops each day. This blank also indicates the car number, time and nature of



Note.—In entering bearings, pinions and fields add the numerals 1, 2, 3, 4, as required to denote the motor number. "S" signifies car sent to shop for overhauling. "P" signifies car sent to paint shop.

Chicago City Railway—Page from Car Repair Record Book.

the defects of each car pulled in, together with the time at which the repairs were completed. It also shows the car number, repairs necessary, materials short and probable date for completing the repairs for all cars being held in at the car house. After these reports are made out and signed by the foreman they are sent to the assistant master mechanic, who checks them and keeps them on file for one month. The reports for the month are then vised by the master mechanic and sent to the claim department for permanent filing.

Pull-In Chart.

In the office of the assistant master mechanic is a pull-in chart showing the number of pull-ins at each car house each day in percentages of operable cars. The chart is plotted on cross section paper about 30 inches wide by 12 inches high. The ordinates of the curves are percentages and the abscissæ represent the time in days. The percentage curves for all the car houses are plotted on this one chart and therefore a key is exhibited at the left of the chart, listing opposite the names of each car house its indicative color. In a parallel column opposite the list of car houses is shown the number of cars required for the schedules operated from each car house.

Each day as the car house foremen's pull-in reports are received the percentage of pull-ins to total operable cars is figured for each car house. These percentages are plotted on the chart above their respective dates and in the colors as shown by the key. Connecting the percentages for each car house with lines drawn in ink representing that car house, results in the graphical exhibition of the comparative percentages of pull-ins for the entire system. The weather is noted on the chart each day. It is thus, by the aid of the chart, easily possible for the assistant master mechanic to compare the character of the work of the men at the various car houses and note any deficiency in the average results of that work.

In making car repairs at the car house such defects as broken axles, flat wheels, truck and the heavier motor repairs, which necessitate raising the car bodies, are handled at the east end of the north bay of the rear car house, which is equipped with traveling cranes, hoists and shop tools suitable for making such repairs.

The records of the work in this bay are the same as those for inspection and lighter repairs, with the addition of a blank form which covers the placing and removal of wheels. This blank, after having been filled in, is sent to the master mechanic, so that the information exhibited may be entered in a large wheel mileage record.

Repair Record Book.

As a means for ready reference for the foreman by which he can quickly ascertain the nature of the repairs that have been made to any particular car during any desired period, a key with symbols is used so that the various repairs can, with facility, be placed opposite the car numbers in a repair record book. This book has pages 6 by 9½ inches in size. At the left of the page is a space for indicating car numbers and at the right space is left for making any special remarks. The key used in this work and a portion of one page of this repair record are reproduced herewith. This scheme for recording motor car repairs with a key is found very useful in fixing the blame for careless work and also for keeping track of supplies. It is easily kept, requiring but little time, and therefore forms a valuable record for the car house foreman in his efforts to assure that careful repairs are being made.

This record book does not exhibit the name or number of the man making the repairs, but by referring to this record the foreman can learn the day and nature of the repair made on any car coming under his jurisdiction. With this informa-

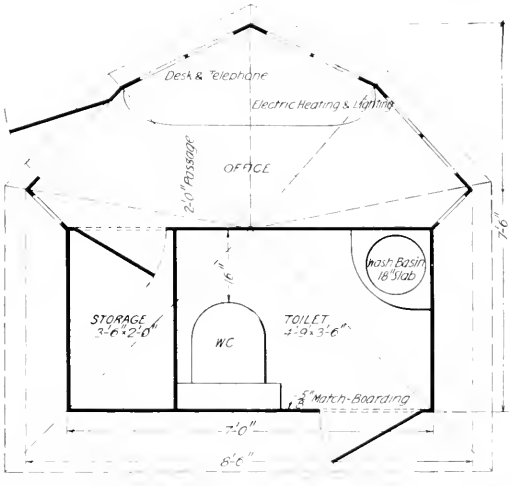
Chicago City Railway—Car House Foreman's Daily Report.

tion he then refers to the repair men's work records, which have earlier been described, as showing all the work done by each man for any particular day. These records are kept on file in 31 pigeonholes in the foreman's office. Each pigeonhole contains all the repair men's records for one day's work. Therefore, with the book and daily records handy there always is available a detailed statement of the repair work done by any man during a preceding month. A similar method, utilizing 12 spaces in the cabinet, is used for filing

the daily records of car repairs. The records for one month are kept in each space in the cabinet, and therefore with the 12 spaces a complete record of a year's repair work on all cars is available on instant notice.

Shop Trucks.

With a view to minimizing the idle investment in equipment because of cars being held in the shops, the shop department keeps a supply of shop trucks at the car houses. When it is necessary to repair a car body the good trucks under that body may be kept in service under some other



Chicago City Railway—Floor Plan of Terminal Booth.

car and the damaged body sent to the shops on a pair of shop trucks.

Terminal Inspection and Cleaning.

In order to maintain the cars in a clean condition while in operating service and thereby relieve the conductors of the duty of sweeping, a system of terminal cleaning and inspection has been inaugurated. Stationed at the terminus of each line of the first division are car cleaners who meet each car as it reaches the terminal on each round trip. The cars are swept and dusted and any minor repairs or adjustments required are at once made. At each terminal a storage closet is provided in connection with the starters' booths, in which are kept an assortment of those parts and fittings that usually are required for minor repairs.

An accompanying illustration shows one of the terminal combination dispatching and cleaning booths. The interior of the booth is divided into three compartments. The front half is used by the dispatcher. Opening off this front half is a tier of compartments in which the terminal car cleaners' supply parts for minor repairs are kept. The remaining portion of the booth is a toilet room with an outside door opening on the side away from the street. Each terminal cleaning station is supplied with a sheet steel rubbish can 24 by 24 by 36 inches in size. Into these cans the cleaners empty all the sweepings from the cars so that no dirt is swept into the streets. Each cleaner also has a sheet steel dustpan about 24 inches long, provided with a hook at one end, which may be placed around the platform stanchion during the sweeping process. The supply of materials at each terminal cleaning booth includes the following: Air fuses, ribbon fuses for double-truck cars, lamps of all kinds, light plugs, motor brushes, compressor brushes, governor fuses, trolley rope, trolley snaps, trolley eye screws, trolley wheels, trolley wheel washers, trolley poles and bases, controller fingers, air gauges, glass and hands, bell rope, register rope and register pulleys, bell plungers, post grab handles, wood and sockets for same, seat bolts, screen clamps or crossbar, vestibule door hangers and screws, cotter keys, waste, oil, grease and oil can for engineers' valve.

At the more busy terminals two men are required each day, one man reporting at 7 in the morning and working until 7 at night, and the second man reporting at 10 in the morning and working until 10 at night. By this arrangement two men are on duty during the afternoon rush hour. It is not necessary to have two men at each terminal during the morning rush hour because the cars are cleaned thoroughly at the car houses just before they are taken out for the morning runs. After 10 o'clock at night the headway is so increased that the cars for all runs on the first division lines can be cleaned by one man stationed at the downtown terminal of the division. This man is on duty downtown cleaning cars from 11 p. m. until 5:30 a. m., after which he finishes his 10 hours' service at one of the car houses.

This practice of terminal cleaning has been found to be both economical and practical. The value of clean cars in the matter of their impression on the traveling public is inestimable. Also, as the conductors are relieved from their sweeping duties it is possible to shorten the terminal layover time and thereby increase the service performed by each car. The conductors are also able to keep their hands and clothes clean. Another advantage, which is an especially important one, is brought about by the practice of terminal cleaning and

Chicago City Railway—Terminal Booth for Car Cleaner, Repairer and Dispatcher.

inspection. This is the substantial reduction in pull-ins and accidents.

The repair and cleaning men at each terminal report to the assistant master mechanic on blank forms, such as those earlier described for use at the Seventy-seventh street car house.

The organization of the mechanical department comprises a master mechanic, D. A. Faut, reporting to H. B. Fleming, chief engineer, and two assistant master mechanics, R. T. Senter, in charge of car houses and equipment, and D. McGill, in charge of shop work, assisted by car house and shop department foremen. We acknowledge our indebtedness to these heads of departments for assistance rendered in compiling this article descriptive of the interesting car house maintenance work of the Chicago City Railway.

MILWAUKEE ELECTRIC RAILWAY & LIGHT COMPANY'S REPLY TO ACCOUNTING CIRCULAR.

BY C. N. DUFFY, COMPTROLLER.

Replying on behalf of this company to Accounting Series, Circular No. 20, dated Washington, January 10, 1908, addressed "to accounting officers of electric lines," the circular states: "It is desired that reply to this circular be made not later than March 28, 1908." Circular No. 20, although dated January 10, 1908, was not received at this office until March 2, 1908.

In compliance with your request for certain specific information as outlined in questions Nos. 1 to 11, both inclusive, on pages 4 and 5 of Circular No. 20, the following is submitted:

1. Name of company?

2. Number of miles of line operated?

3. Number of cars operated under normal conditions?

The Milwaukee Electric Railway & Light Company, operating also the Milwaukee Light Heat & Traction Company, covers the following electric railway systems (overhead trolley): (a) Milwaukee city system, the system operated in the city of Milwaukee, Wis., and to and in interurban points adjacent to Milwaukee, comprising approximately 143 miles of single track (revenue track only, tracks in car houses, yards, etc., not considered) and an equipment of 398 double-truck cars. (b) Racine city system, the system operated in the city of Racine, Wis., comprising approximately 18 miles of single track (revenue track only, tracks in car houses, yards, etc., not considered) and an equipment of 20 single-truck cars. (c) Interurban system, composed of three interurban lines radiating from the heart of Milwaukee to Oconomowoc, East Troy and Kenosha, Wis., respectively, comprising approximately 138 miles of single track (revenue track only, tracks in car houses, yards, etc., not considered) and using approximately 15 miles of single track in the city of Milwaukee, Wis., with an equipment of 35 interurban motor cars and 60 interurban trail cars.

This makes a total, as shown in (a), (b) and (c), of approximately 299 miles of single track operated (revenue track only) and approximately 11 miles of single track (non-revenue, tracks in car houses, yards, etc.), or a total trackage of approximately 310 miles measured as single track, with an equipment of 513 cars.

The average maximum number of cars operated per day in the year 1907 was 387, and the average car-hours per car per day was 11.5.

4. Do you favor dividing electric lines into two classes, as outlined in this circular?

No.

5. What limit, in your opinion, should be used as a line of demarcation indicating the distinction between a large and a small company?

If only one line of demarcation is to be drawn, and that line based on "gross annual revenue," then the dividing line should be $500,000 gross annual revenue, and not $50,000. Furthermore, the question of having possibly three classes instead of two is worthy of careful consideration, as, for example, the following: (1) For companies having gross annual revenue of $500,000 or less. (2) For companies having gross annual revenue between $500,000 and $1,000,000. (3) For companies having gross annual revenue of $1,000,000 and over.

It may be that some basis other than "gross annual revenue" could be taken as a line of demarcation, for instance, trackage, cars, etc.

6. What was the gross revenue of your company as shown in its last annual report? $3,926,469.28.

Depreciation.

7. What would be the approximate aggregate charge to operating expenses for the year ending June 30, 1908, resulting from the application of the theory of depreciation to the equipment of your company as outlined in this classification? (In your reply please explain in detail the method by which you arrive at the amount stated.)

Assuming that "equipment" means the physical property covered in the "tentative classification of expenditures for road and equipment" grouped under "permanent equipment," "revenue equipment" and "service equipment," the approximate aggregate charge to operating expenses for a period of one year would be about $280,000, based on a "depreciation estimate" of 7 per cent per annum, as being the estimated depreciation over and above maintenance chargeable to operating expenses. "Permanent equipment," as herein treated, is exclusive of "cost of road purchased."

In its relation to "depreciation," "maintenance" is a most important factor. The measure and extent of "depreciation" of physical property is dependent, in so far as wear and tear incident to use is concerned, on the amount of "maintenance" expended in the physical up-keep of the property.

This "depreciation estimate" of $280,000 is figured at 7 per cent per annum on the cost of reproduction, new, for the physical property covered in "equipment," approximately as valued by the Wisconsin railroad commission as of January 1, 1907, plus additions and betterments made in the year 1907, subsequent to the date of the valuation.

The depreciation charge of 7 per cent per annum is intended to provide only for depreciation resulting from deterioration and wear incident to use, without regard to obsolescence or supersession.

This company believes in the principle of "depreciation" and the practical application of the principle in providing for depreciation in its accounts; it has recognized and applied this principle in its accounts since January 1, 1897. The provision for depreciation has not been to the extent the company considered necessary, but to the extent it was consistently able to provide and give to capital some measure of fair return on its investment.

Referring to "consideration of depreciation," as outlined in Circular No. 20 (pages 7 and 8) and with reference to the "depreciation estimate," as laid down in other places in Circular No. 20, would it not be well to consider, as a means of recognizing the principle of depreciation and the application of that principle, to suggest, or permit, or instruct, if you please, the "accounting officers of electric lines" to take from the gross earnings a certain percentage monthly, from 1 per cent per annum upwards, credit it to a "depreciation reserve account" and distribute the sum so set aside in the proper operating expense accounts, so as to apply to the entire physical property?

This in a way has been the method pursued by this company, the percentage of its gross earnings so set aside being practically 10 per cent since January 1, 1897.

8. What is the present surplus (or deficit) from operation of your company, and in what particular years did it accumulate?

The surplus of this company, as per its books, at the close of business December 31, 1907, was $884,808.61, accumulated as follows:

Year.	Surplus.	Deficit.
1897	.....	$ 26,447.91
1898	$ 75,870.13	.....
1899	138,686.67	.....
1900	1,439.13	.....
1901	198,543.59	.....
1902	350,849.01	.....
1903	.....	77,264.15
1904	150,016.95	.....
1905	.....	120,207.64
1906	99,431.54	.....
1907	93,891.29	.....
	$1,108,728.31	$223,919.70

9. Please give a list of joint facilities involved in the

operations of your company.

This company has no joint facilities involved in its operations.

10. Do you consider the principles involved in the joint facility accounts as applicable to electric railway carriers?

There is a question as to the practicability of applying to electric railway carriers the principles involved in the joint facility accounts, particularly on such interurban lines as use the tracks of urban companies in operating interurban cars into the heart of and through large cities, especially where the application of said principles would involve a complicated division of fares to cover a complicated ownership or joint use of tracks. The principles involved in the joint facility accounts as laid down in Circular No. 20 are sound and correct.

Advisability of Distinct Classifications for Urban and Interurban Roads.

11. General criticisms:

In connection with suggestions made relative to establishing a line of demarcation indicating the distinction between a large and a small company, the advisability of considering two separate and distinct classifications of accounts may be proposed, one for "interurban railway systems," the other for "urban railway systems," as the construction and operation of one is quite different from the other.

The classification of accounts as outlined in Circular No. 20 appears to be essentially a classification better adapted to the conditions and wants of steam railroads rather than electric railways, and is better suited to interurban electric railways than urban electric railways.

It should be borne in mind in speaking of urban electric railways that, in addition to surface lines in cities, there are elevated lines and subway lines as well.

This company, operating two city systems of electric railways aggregating 161 miles of single track, and an interurban system of electric railways aggregating 138 miles of single track, has used continuously for a period of nine years the standard system of electric railway accounting of the Street Railway Accountants' Association of America (amplified for its specific purposes), and has found this system not only fully adapted to its requirements for both its urban and interurban electric railway systems, but entirely satisfactory to the Wisconsin state railroad commission in making annual reports of the operations of the railway systems to that body.

The state of New York found the standard system of electric railway accounting of the Street Railway Accountants' Association of America adapted to its needs, not only for the surface, elevated and subway lines of the city of New York, but also for the interurban lines of the state; and the same statement is true of the state of Illinois with reference to the elevated lines of the city of Chicago, as well as the interurban lines of the state.

This is referred to here in view of statements made to the effect that the classification of accounts of the Accountants' association was suitable only for urban electric railways and was not adapted to interurban electric railways.

The tentative classification of operating expense accounts adopted by the Accountants' association of the American Street and Interurban Railway Association at its convention held in Atlantic City, in October, 1907, was devised for the purpose of meeting the supposed wants of interurban electric railways and with the idea of conforming to the interstate commerce commission classification for steam railways, in so far as was possible and practicable, consistent with the difference in conditions in the construction and operation of electric railways as compared with steam railways, and at the same time meeting the requirements of electric railways. This was accomplished, judged by the action of the convention of the Accountants' association in unanimously adopting the tentative classification after a full and exhaustive discussion and debate of its features, indorsing its principles and their application, and with the conviction that the 50 primary operating expense accounts and the subaccounts recommended were ample for the purpose of showing the results of the operation of electric railways from the point of view, not only of investors and managers, but state railroad commissions, or other like bodies that exercise or may exercise supervision over the operations of electric railways and their accounts, and the public as well.

The old classification of the Accountants' association, with its 39 primary operating expense accounts and without any subaccounts, used by electric railways for a period of 10 years, officially adopted by the National Association of Railway Commissioners, used by the bureau of the census in gathering and compiling statistics of electric railways for the year 1902, has met all requirements, the 39 accounts being adapted for the wants of the largest electric railway systems and not burdensome for the smallest, by reason of the simplicity and flexibility of the construction and arrangement.

The classification of accounts outlined in Circular No. 20, consisting of 22 primary operating expense accounts for "small companies" and 116 for "large companies," does not prescribe sufficient primary accounts for a small company and it has too many for a large company. A classification of accounts, devised and applied for the purpose of reflecting broadly the results of the operation of a particular business, should be so constructed and arranged as to accomplish this by the application of correct accounting principles in a practical manner to the peculiarities of the business dealt with and cover the specific conditions of the operation of that business. As you yourself, Professor Adams, once said in connection with this question: "Business cannot be put into a strait jacket." To apply the classification of accounts as outlined in Circular No. 20 to the rank and file of the 481 electric railway companies the gross earnings of which were published in 1907, would put the majority of them in a "strait jacket."

The aims and objects of the interstate commerce commission to bring about uniformity of accounts for all carriers, whether operated by steam or electricity, should have the hearty support and co-operation of everyone in any way engaged in the transportation business, whether passenger or freight, or both, or electric or steam. The principles laid down to govern a classification of accounts to accomplish such a result, if said principles are sound and correct and practicable in their application, should be upheld and followed in all classifications of accounts of all railroads. This should obtain, whether dealing with steam or electric railways, urban or interurban, surface, elevated or subway lines in cities, or the operation of parts of the great railroad systems of the country, as they are now operated in part by electricity, notably the New York Central & Hudson River Railroad, or applicable to the operation of the present electric line now in operation underneath the Hudson river, or similar lines under construction and soon to be put into operation. Indeed, the question should be looked at from such a broad, comprehensive and practicable standpoint as to anticipate and provide in advance for what within a few years may be a reality, namely, the substitution of electricity for steam as a motive power, in all lines of railroad transportation.

Tentative Classification of Operating Expenses—Adjustment Accounts.

The principles governing "adjustment accounts" for the treatment of "outside operations" are sound and correct, but the points as presented in Circular No. 20 would hardly be applicable to electric railways generally, at least not in the manner and to the extent referred to; and it is questionable whether the questions are of sufficient importance to justify the application of the principles involved in the manner or to the extent suggested.

Availability Maintenance Expenses.

Account No. 39, "care of track," intended for and applicable to interurban electric railways, can be properly classi-

fied as a maintenance account without the qualifying term "availability maintenance."

The principles laid down with respect to "availability maintenance account expenses," governing charges under account No. 40, "removal of snow, sand and ice," and No. 41, "cleaning, sprinkling and oiling roadbed," are not applicable to electric railways, as the character of the work performed chargeable to these two accounts does not deal with "maintenance," but with "operation" or "use." The principles involved in connection with the treatment of these two accounts are differently applied with reference to instructions under "lubricating cars" in account No. 95, "car supplies and expenses." The lubrication of car journals dealing with the "operation" or "use" of the cars is classified, and properly so, under "operation of cars," while the up-keep of the car journals dealing with the "maintenance" of the cars is classified, and properly so, under "maintenance of revenue equipment."

There seems to be a difference and contradiction in the application of the same principles in connection with the treatment of "availability maintenance expenses" under "maintenance of way and structures" and under "maintenance of equipment," the latter having no "availability maintenance expenses." Accounts Nos. 40 and 41 should not be grouped under "maintenance of way and structures," but under "transportation expenses," and furthermore, there should not be any such group as "availability maintenance expenses" under "way and structures" or "equipment."

Account No. 42, "injuries to persons," and account No. 43, "other miscellaneous maintenance expenses," are improperly classified when placed in a restricted way under "availability maintenance." The scope of these two accounts, if they are to be applied as outlined, should deal with "maintenance of way and structures" broadly, and not restrictively to "availability maintenance" only.

Maintenance of Service Equipment.

"Maintenance of service equipment" should be grouped under "maintenance of equipment," and not under "maintenance of way and structures," as unquestionably the former is the correct subdivision for "maintenance of service equipment" for the reason that all the service equipment, except snow equipment, is used for other purposes than "maintenance of way and structures," just as "shop machinery and tools" are used for all purposes and properly classified under "maintenance of equipment." There is no separation under "maintenance of service equipment" between the electric equipment of the work cars, electric locomotives, etc., and the cars, locomotives, etc., although there is such a separation as applied to the different types of revenue cars operated. This appears to be inconsistent. If separation of the electric equipment is necessary or desirable in one case, it should be in the other, and unquestionably there should be a separation, especially in attempting to arrive at a charge for "depreciation estimate." Furthermore, the experience of electric railways has demonstrated that it is the best practice to carry the maintenance of all electrical equipment of cars, whether for "revenue equipment" or "service equipment," in one account, as these equipments are frequently shifted from one type of car to another.

General Expenses.

It is not a desirable arrangement to group "salaries and expenses of general officers" under one account, as provided in account No. 106, or "salaries and expenses of clerks and attendants" in one account, as provided in account No. 107, as these accounts are neither one thing nor the other, with respect to the distinction as between what may be "salaries" and what may be "expenses."

Clearing Accounts.

The six clearing accounts as prescribed can be made applicable to electric railways, and the principles governing them are sound and correct, but it would appear that if there is to be a clearing account for "shop expenses" it should also include account No. 62, "shop machinery and tools," and account No. 63, "other equipment expenditures," and that "work equipment—operation" should also include "maintenance of service equipment," or these clearing accounts, as proposed, will deal only partially with the principles underlying the use of clearing accounts; on the other hand, the important question of drawing the line of demarcation and preserving the integrity of that line absolutely, as between what is "maintenance" and what is "operation" or "use," will be rendered impracticable.

The application and use of "shop expenses" as a clearing account would probably prove somewhat difficult on many electric railways; to treat "insurance" and "injuries and damages" as clearing accounts is an innovation and a departure from former practices in electric railway accounts, but may be the solution of reconciling the differences in the treatment of these two latter accounts as between steam and electric railways, especially as to "injuries and damages." As to "insurance," the practice of electric railways to consider this as one of the "general expenses" of conducting the business, an executive or administrative proposition rather than a departmental one, and by reason thereof carrying all "insurance" in one account and grouping it under "general expenses," is logical and the proper treatment of the question.

If the use of clearing accounts is to be so extensive it might be well to add to the six prescribed an additional one, "stationery and printing."

The clearing account entitled "injuries to persons" should be entitled "injuries and damages," in order that the use and application of this account would be broadened, as indicated by the title, and not be restricted, as it would be, under the title "injuries to persons."

Number and Titles of Accounts, Their Grouping and Arrangement.

The number of primary operating expense accounts prescribed by Circular No. 20—116—is objectionable, unnecessary and in many instances impracticable; the number should be condensed into at least one-half of the number proposed.

The titles of many of the accounts are strange and unfamiliar; in a number of cases the titles should be changed for more appropriate and comprehensive ones.

The grouping of the accounts, from the standpoint of electric railways, is not in accord with the best practice based on experience.

These questions are to a considerable degree of minor importance, being questions of detail rather than of principle, outside of the number of primary accounts, which is a matter of the greater importance.

Tentative Classification of Expenditures for Road and Equipment.

In the text for account No. 61, "interest and commissions," there is the following note:

"Discounts on securities issued for construction purposes or to raise funds for construction should not be charged to this account or considered as a proper charge against construction."

Discount on securities issued for construction purposes or to raise funds for construction is a "capital expenditure," whether such construction is in connection with a steam railroad or an electric railroad, and if not carried in "expenditures for road and equipment," where is it to be carried?

Under the laws of the state of Wisconsin bonds covering the construction and equipment of electric railways cannot be issued without the sanction and approval of the board of railroad commissioners. The law provides that the bonds so issued may be sold at a discount, said discount not to be more than 25 per cent.

Discount on bonds issued and sold for the construction

and equipment of steam or electric railways is as much a part of the cost of the construction and equipment as the rails or cars.

This principle is sound and correct from an accounting standpoint; just, as far as the public is concerned; equitable, from the standpoint of investors; and a vital question that must be dealt with in financing railroads, steam or electric.

INTERURBAN CARS FOR OKLAHOMA.

The Choctaw Railway & Lighting Company of South McAlester, Okla., has just placed in service two very handsome interurban cars built by the Niles Car & Manufacturing Company of Niles, O. They are modern in every particular, and as an indication of the rapid progress that is being made in the interurban and street railway development of that section, a brief description will be of interest.

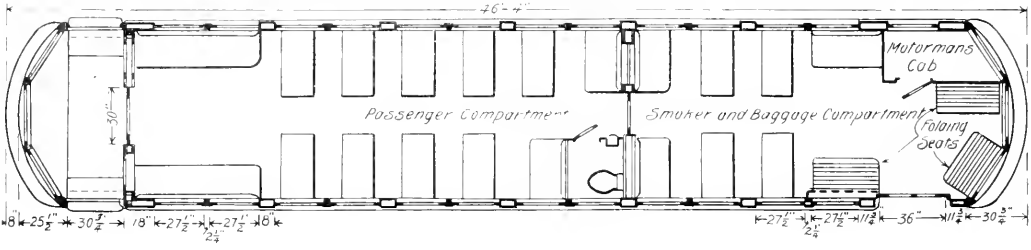
The cars are of the single-end type, having main passenger and combination smoking and baggage compartments, with passenger entrances at either side of the rear vestibules. The general dimensions of the cars follow:

Length over end plates	34 ft.
Length over vestibules	45 ft.
Length over buffers	46 ft. 4 in.
Truck centers	24 ft. 6 in.
Wheel centers	6 ft.
Wheels (diameter)	33 in.
Width of car at sills, including panels	8 ft. 8 in.
Extreme width of car over all	8 ft. 10 in.
Height of car from under side sill to top of roof	9 ft. 5 in.
Extreme height from track to top of trolley bridge	12 ft. 8 in.
Seating capacity	50 persons
Approximate weight of car body without load	25,000 lb.

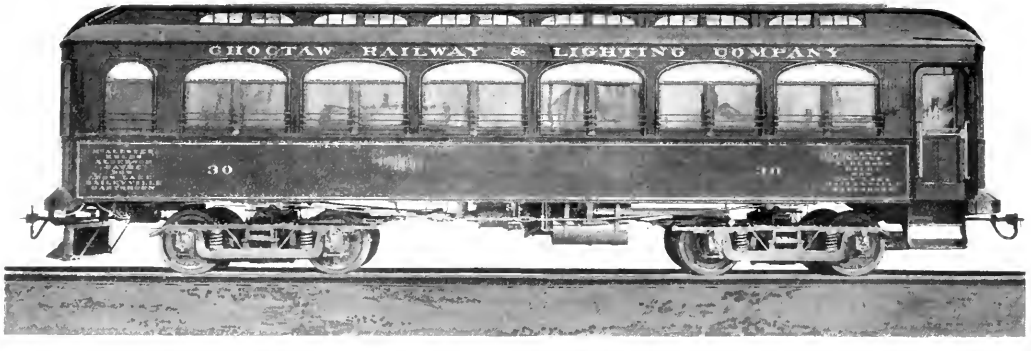
The cars are of semi-steel frame construction. The side sills are composed of one piece of yellow pine 4½ by 7¾ inches and one piece 17⁄8 by 6 inches, with steel plate 5⁄8 by 7¾ inches bolted between and extending the full length. Each of the two center sills is a 6-inch steel I-beam filled with long-leaf yellow pine and the two intermediate sills are of 3¾ by 6 inch yellow pine. The end sills are of oak, reinforced with steel plates, and are of the same style and dimensions as the outside sills. The flooring is of yellow pine laid double with waterproof building felt between. The car company's standard method of trussing is used. The needle beams are 6-inch steel I-beams, two to each car, fitted at the ends into truss rod struts fastened to the bottom frame. The bolsters are of steel plate truss form.

The roof is of the monitor deck style, running the full length of the car, with the steam coach type of hood, supported by steel carlines, one over each intermediate side post. Each end of the car is inclosed with permanent vestibules having three sashes and sheathed on the outside below the sash rest with No. 14 sheet steel. Each side of the rear vestibule is fitted with double steps of the Stanwood type. There are 12 windows on each side between corner posts of the Pullman style, with two sashes to each window. The lower sash is arranged to raise and is fitted with the Edwards bevel sash lock and bar. The monitor deck has 12 sashes on each side hung on Hart's ratchet deck fixtures. All sashes in the sides and ends of the car are glazed with polished plate glass, while the upper side sashes and deck sashes are of cathedral art glass. Pantasote curtains on spring rollers with eccentric fixtures are provided for all side and end windows.

The interiors of the cars are finished in quarter-sawed oak. The main passenger compartment has the golden finish, while the smoking compartment is of dark Flemish oak, varnished and rubbed down to a smooth dead finish. The main panels are outlined with a neat inlay of colored woods. The ceilings are of the semi-empire style of 3-ply veneer painted and decorated in green and gold. The toilet room is located in the main passenger compartment against the smoking room partition. As shown in the accompanying floor plan the combination smoking and baggage compartment is arranged to



Choctaw Railway Cars—Floor Plan and Seating Arrangement.



Choctaw Railway Cars—Side View of Finished Body.

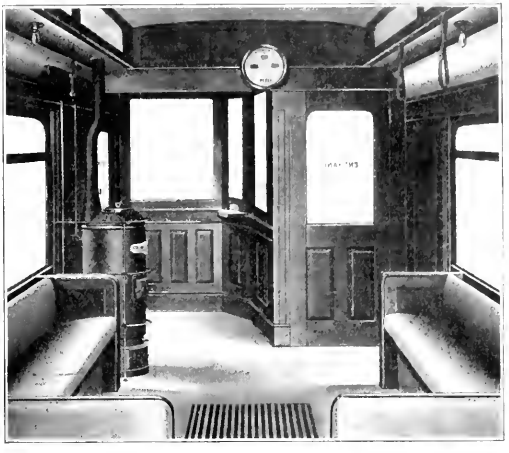
accommodate the largest possible number of passengers, the motorman's cab being located at the left-hand side and the folding seats being conveniently located for accommodating passengers when the vestibule is not filled with baggage. The seats are of the Hale & Kilburn walkover type, except those against the bulkheads and sides of the car, which have stationary backs. Long longitudinal seats have been placed in the rear of the car so as to facilitate as much as possible the loading and unloading of passengers. The rear vestibule doors are of the swinging type. The end body and partition doors are arranged to slide, the baggage room having a 36-inch sliding door at the right-hand side.

The cars are heated by electricity. Drawbars of the radial type and locomotive form of pilots are used. The exterior of the car is finished in olive green and orange. The Knox Engineering Company of Chicago, engineer for the Choctaw Railway & Lighting Company, prepared the plans and specifications for these cars.

CINCINNATI CAR COMPANY'S PAY-AS-YOU-ENTER CAR.

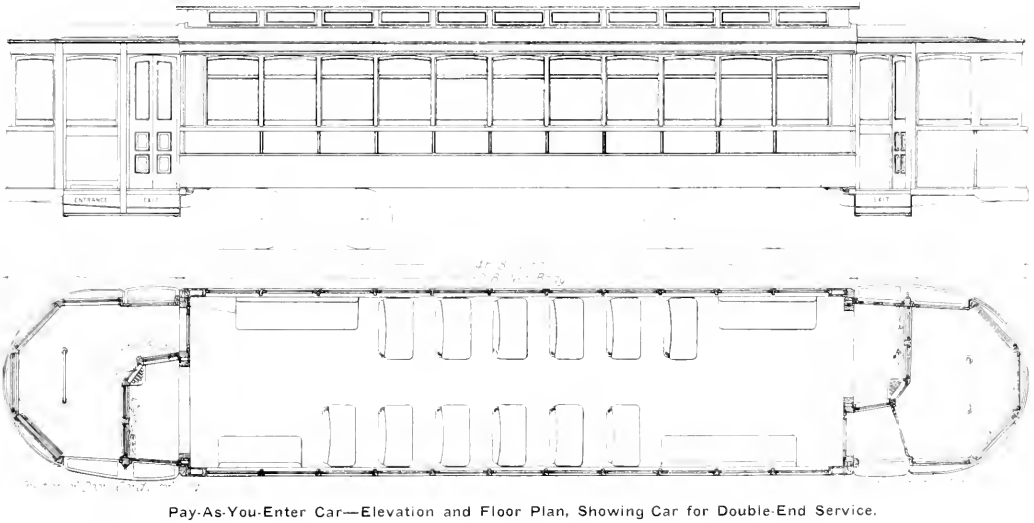
The Cincinnati Car Company has prepared drawings for a newly designed semi-steel pay-as-you-enter car, which introduces some novel and interesting features. This car is provided at each end of body with the usual swing door, which is used for entrance and exit, according to the direction in which the car is running. An inclosure is built on the platform, which is open to the main body of car, thus eliminating the usual end body bulkhead and sliding doors. The conductor can therefore give all the necessary attention to passengers entering the car, make change and see that the fares are paid. Meanwhile he can watch the passengers inside the car. His presence within the car body makes the calling of streets a simple matter, since there are no doors to open or close. This platform inclosure is provided with a folding and swinging exit door, which is controlled by the conductor through a lever arrangement with which he can positively lock the door in either position, i. e., open or closed, thereby eliminating any accidents occasioned by passengers leaving the car when it is in motion. The inclosure partition is provided with drop sash, affording ample air circulation in warm weather. This inclosure is further provided with a small window which opens into the entrance side of the platform.

The partition forming the inclosure can be arranged to take care of a fare box, which will be in full view of the conductor. This arrangement gives the conductor full control of the passengers entering and leaving the car. Should any passenger attempt to pass into the car without paying his fare the conductor may easily stop him by merely stepping in front of the passenger without opening any doors.



Pay-As-You-Enter Car—Interior View of End.

At the motorman's end the entrance is inclosed by a sliding door, which is hung on swivel hangers, permitting it to slide back of the controller. It does not take up any more space than the thickness of the door and the necessary allowance to prevent it from being marred by coming in contact with the vestibule finish, etc. The exit door, which is controlled by the conductor (when he is at the rear end), is locked by the lever arrangement earlier described. The front exit door in the body of the car can only be released by the motorman through a magnetic door opener, this door being held closed by a Blount or Corbin door check. The door in-



Pay-As-You-Enter Car—Elevation and Floor Plan, Showing Car for Double-End Service.

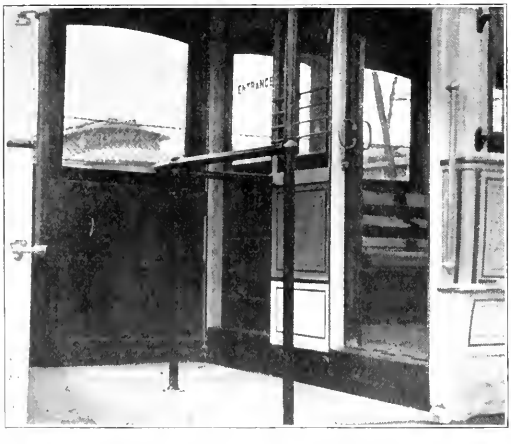
closing the front platform exit will be hung on double-acting spring hinges and will be swung against the partition, thereby separating the motorman and smokers from any passengers that may be leaving the front end of the car. This door is also controlled by the motorman with swing latch connected to a rod and lever, this lever being directly over the motorman's head. Smokers and others riding on the front platform cannot leave unless the motorman unlocks the door, which, however, is open to passengers who may desire to enter the smoking compartment. This arrangement of door and platform affords a quick exit, as the platform steps are in close proximity to the body door, and passengers leaving the main compartment are not inconvenienced by jostling against the smokers. The car body and front platform can be heated easily because the door arrangement permits no direct drafts.

The designs for cars for both single and double end service are equally simple.

PAY-AS-YOU-ENTER CAR IN CLEVELAND.

The first pay-as-you-enter car to be operated in Cleveland was placed in service last week by the Cleveland Electric Railway. The car was reconstructed from one of the company's standard closed cars at the Lake View shops, and, in accordance with the standard practice in Cleveland, it is to be operated from one end only. The car body is 30 feet long and the platforms are each 8 feet long, making a length of 46 feet over all. The arrangement of the rear platform, as shown in the engraving, is practically the same as on the pay-as-you-enter cars which have recently been placed in service in Chicago, Buffalo and New York. The front platform, however, shows several interesting improvements, designed by Terrance Scullin, master mechanic of the Cleveland Electric Railway, which are shown in the accompanying plan.

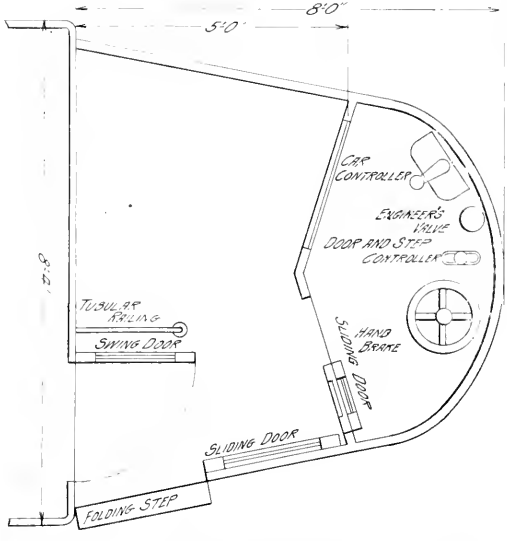
The front portion of the platform is partitioned off to form the motorman's cab and has a sliding door in one of the



Cleveland Pay-As-You-Enter Car—Showing Arrangement of Rear Platform.

sides of the partition which is provided with a catch on the inside so that passengers cannot interfere with the motorman. An iron railing extending outward from the bulkhead separates a space in which smokers may stand from the portion of the platform which is used by outgoing passengers. The door from the car body to the platform folds against the iron railing. The exit door, which is of the sliding type, is controlled by the motorman by means of a lever placed between the hand brake staff and the engineer's valve. This lever also controls the front exit step, which is dropped as the door opens. A reverse movement closes the door and raises the step, which is folded against the side of the vestibule, so that passengers will not attempt to board the car by means of this door.

On account of the length of the platforms it was necessary to reinforce the sills of the car. On the blind side this was done by means of a ⅝ by 12 inch steel plate bolted to the sill and extending the full length of the outside of the car to the ends of the platforms. On the working side of the car the platforms, which are dropped eight inches, are supported by knees built up from ¾ by 10 inch steel plates, which extend back along the side of the car for a distance of seven feet.



Cleveland Pay-As-You-Enter Car—Plan Showing Arrangement of Front Platform.

This plate is bolted through the timber side sill and through an outer plate extending the full length of the car body. This method gives a very strong construction for the platforms.

The company is also planning to reconstruct a number of its cars in this way, but the pay-as-you-enter collecting system will not be enforced until there are sufficient cars to equip one line.

We are indebted for the description of the car to George L. Radcliffe, general superintendent of the Cleveland Electric Railway.

The Sapulpa & Interurban Railway Company, which was organized about a year ago to build a street railway system in Sapulpa, Okla., and extensions to the Glenn oil fields, has recently completed its line in Sapulpa. The formal opening of the line occurred on March 18, when members of the Commercial Club and the city council and newspaper representatives made the initial trip in the new cars and later attended a banquet given by the company at its power house. The company expects to continue the line through the Glenn oil fields to a connection with the Midland Valley Railroad.

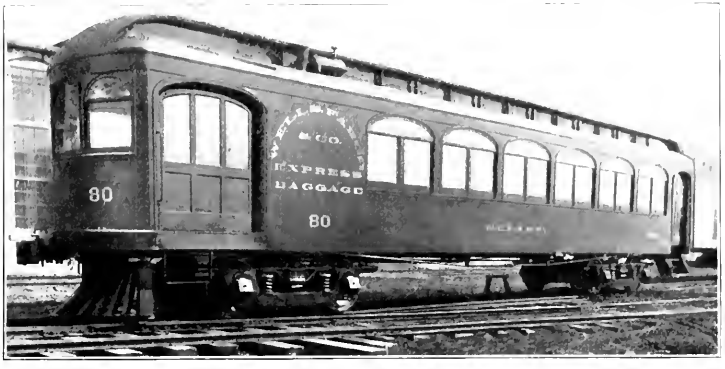
Pay-As-You-Enter Cars for Newark.

It is announced that 50 new cars of the pay-as-you-enter type will be placed in service in Newark, N. J., by the Public Service Railway on Sunday, April 12. These cars were built by the Cincinnati Car Company and were described in the Electric Railway Review of February 15, 1908, page 213.

PASSENGER AND BAGGAGE CARS FOR THE WATERLOO CEDAR FALLS & NORTHERN RAILWAY.

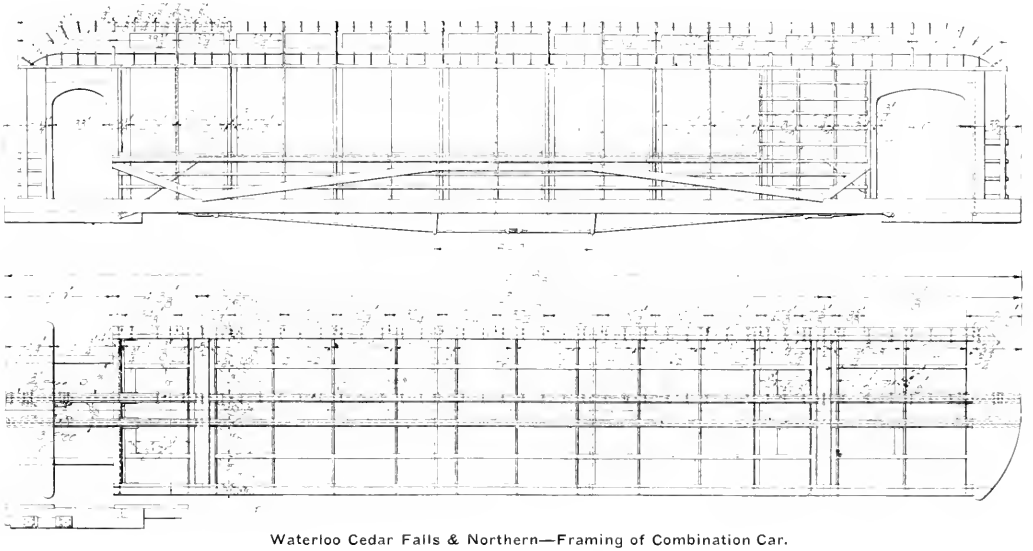
The Waterloo Cedar Falls & Northern Railway of Waterloo, Ia., has recently received from the McGuire-Cummings Manufacturing Company three combination passenger and baggage cars which were designed under the personal supervision of C. D. Cass, general manager of the railway company. As this company operates 50 miles of steam road in addition to its 39 miles of electric line, the cars are designed for operaton in trains with standard steam railroad cars and are of a substantial type of construction.

The cars are for single-end operation and the baggage compartment, which also serves as the motorman's cab, is at the front end. They have the steam coach type of hood with six double windows and one baggage and one vestibule door on each side. They are equipped with M. C. B. draft gear, with Pitt automatic couplers, 5 by 5 inch shank, at each end. Under the front platform is a locomotive type of pilot so placed as to allow two cars to be coupled without interfering with the pilot.



Waterloo Cedar Falls & Northern—Exterior of Combination Platform.

The details of the side and floor framing are shown in the accompanying drawings. The principal dimensions are as follows:



Waterloo Cedar Falls & Northern—Framing of Combination Car.

Length over all	51 ft. 8⅞ in.
Width over all	8 ft. 10¾ in.
Width over side sills	8 ft. 7 in.
Width inside	7 ft. 8¾ in.
Height from rail over trolley board	12 ft. 11 in.
Height from rail to center of drawbar	34½ in.
Truck centers	31 ft. 7⅞ in.

The interior finish is of golden oak with headlinings of birdseye maple. The windows have half oval gothics and 7½-inch pier panels. The sashes are double in two parts, with sash fixtures of the Raymond type. The side sashes are fitted with double-strength glass embedded in rubber, while the gothics and deck sashes are fitted with opalescent glass, the deck sashes being operated by Hart deck sash ratchets. In the rear end of the car body is a single 30-inch sliding door with double sashes in one part on either side of it. The door between the baggage and the main compartments has a 25-inch opening with panels on either side of the same design as the windows at the rear end. Each car contains 22 Hale & Kilburn No. 10 stationary rattan upholstered seats, 18 by 34 inches, with grip handles on the aisle side, and two stationary rattan seats at the vestibule end of the car, which afford seats for 48 passengers. The curtains are Pantasote, with Keeler eccentric fixtures. A curtain box is built just below each gothic sash.

The baggage room is finished in golden oak and has three sashes in front. The center single sash is in one part and the two side sashes are single in two parts. The segment sashes are glazed with opalescent glass like the gothic sashes. The baggage compartment also has four deck sashes for ventilation.

The vestibule at the rear is finished in golden oak. The doors are double, with oval heads, and are arranged to fold back against the end of the car. The sashes are arranged as in the baggage compartment. The ceiling is provided with a dome painted in light green. The vestibule is also provided with trap doors to fold behind the doors.

The cars are heated with Baker "Mighty Midget" heaters, placed in the baggage room, with a 1¼-inch radiation pipe running back and forth under each seat. A heater pipe grill is placed between the seats. In addition to this hot water heating system there are 12 Consolidated Car-Heating Company's No. 192-W electric heaters placed in the passenger compartment under the seats and four on the bulkhead partition in the baggage compartment. The electric heaters are for use during mild weather.

The cars are wired for five circuits of five lamps each and two Linterm rear-end markers, which are fed by 12-cell batteries. The cells are placed under the vestibule and the current is controlled by a switch in the vestibule. The five lamps in the baggage compartment are independent of all other circuits and are controlled by a switch over the controller. In the passenger compartment there are 18 lamps and in the vestibule two lamps. The switches for those in the passenger compartment are placed in a small alcove, lined with asbestos, in the baggage compartment. On each post in the passenger compartment is a push button operating a signal bell in the baggage room. The cells for the push buttons are placed in the same alcove as the switches.

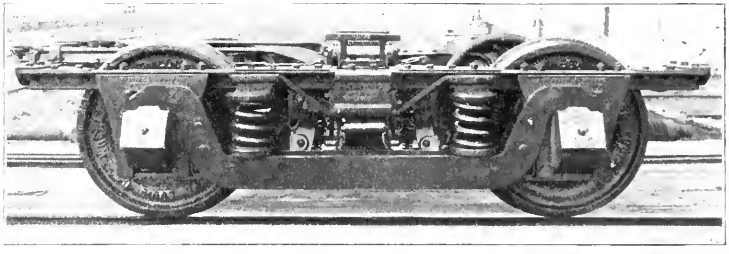
The trucks on which the new car bodies are mounted are the McGuire-Cummings Manufacturing Company's standard No. 20-A type for heavy interurban service. A side view is presented herewith. They are equipped with four General Electric Company 50-horsepower motors and are designed for nose suspension. The general dimensions are as follows:

Wheel base	6 ft. 6 in.
Center to center of journals	6 ft. 3 in.
Width of frame over all	6 ft. 10⅝ in.
Length of frame	10 ft. 1 in.
Top side members angle iron	1x3½x5/8 in.
End sill angle iron	3½x3½x½ in.
Transom	1x8 in.
Tension bar	3½x¾ in.

Waterloo Cedar Falls & Northern—Interior of Car.

The truck bolster is of the built-up type, the top member being 8 by 7/8 inches and the bottom member 8 by 7/8 inches, with a wrought filler placed between at the ends. The bottom bar is gibbed to take the thrust of the end bar. The truck equalizers are 6 by 1 inches in section. The center plate and side bearings are of cast iron and the spring plank is an 8-inch channel. The bolster springs are double elliptic, 32 inches in length. The equalizer springs are 7½ inches in diameter, with a bar 1¼ inches in diameter and 9¾ inches high.

The wheels were made by the St. Louis Car Wheel Company and are 33 inches in diameter, weighing 485 pounds each. The axles, of open-hearth steel, have the following dimensions:



Waterloo Cedar Falls & Northern—Truck for Combination Car.

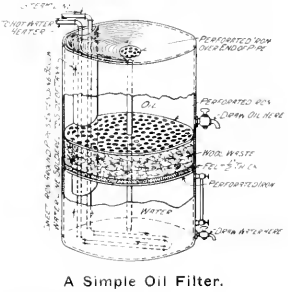
Diameter at centers, 5 inches; diameter at gear seat, 5¼ inches; diameter at wheel seat, 5¼ inches; journals, 4¼ by 8 inches.

The journals and boxes are in accordance with the standards of the American Street and Interurban Railway Association. The journal bearings are of bronze, lead line. The brakes are inside hung. The approximate weight of the trucks is 7,800 pounds. The McGuire-Cummings Manufacturing Company has also recently shipped to this road seven single-truck closed cars and ten 10-bench single-truck open cars for city service.

HOME-MADE OIL FILTER.

BY J. L. SULLIVAN.

In power plants it is found that a considerable saving can be effected by close attention to the handling of oil. The accompanying illustration shows a home-made oil filter which has done remarkably good service in the power plant of the St. Francois County Electric Railway Company, Farmington, Mo.



A Simple Oil Filter.

The mixture of oil and water that is received from the engine is poured into the top, being strained through cotton waste, which keeps out everything except water, oil and very fine dirt. It then passes through a 1-inch pipe in the center to within 1 inch of the bottom, the oil rising to the surface of the water and the fine dirt settling to the bottom. In rising the oil is forced through ½ inch of felt and 5 inches of wool waste packed tightly. It comes out of the upper cock as clear as anyone would wish. A steam pipe is run through to be used when cold weather interferes with the free flow of the oil. This pipe is cleaned out by forcing water down the center pipe and allowing it to wash the dirt out through the cock at the bottom.

JOHN ALBERT BRILL.

John Albert Brill, vice-president, director and one of the founders of The J. G. Brill Company, died in Philadelphia on March 25, as noted in last week's issue of the Electric Railway Review. His death was the result of a painful malady from which he had suffered for four years. Mr. Brill was a pioneer in the development of electric cars and trucks and was the inventor of some of the most valuable improvements in the field of electric transportation, as is indicated by nearly 200 patents on cars and trucks and their parts which were issued to him.

He was of German descent, his parents having moved from Cassel, Germany, to Philadelphia, where he was born on December 15, 1852. As a boy he manifested a studious disposition and he received a good education. At the early age of 17 his ambitious desire to begin his active career led him into the works of the company to which the remainder of his life was devoted and whose success is due in such great measure to his personality. He at once gave evidence of the ability that was in him and while doing a boy's work put his whole soul into each task. He was gradually advanced to more responsible positions and was soon placed in charge of the sales department.

John Albert Brill.

With the development of electric car propulsion in 1887 his great abilities found their appropriate sphere. He conceived the fundamental principle of electric truck construction—the necessity for an independent frame to support the motor—and the first truck built on this plan was of his design. Many of the types of truck in general use at present are practically those which he invented. Possessed of ability of a high order, combining keen insight with indomitable perseverance, he brought to his work the highest qualities of the inventor and the improvements due to his efforts have affected nearly every feature which goes to make up the modern electric car.

He was in every sense of the word a pioneer in the art of electric car construction and foresaw, as if by instinct, and usually years in advance, the tendency of direction of electric street railway development. He devoted himself to the task of teaching the railway companies in accordance with the prospective development which he foresaw. His wisdom and sound judgment were recognized and his advice was constantly sought and followed by the men who were foremost in the management of electric railways.

In 1904 he was awarded the John Scott legacy premium and medal by the Franklin Institute in recognition of his valuable inventions.

The accompanying portrait of Mr. Brill, though not recent, is a good likeness.

NEW CAR CONSTRUCTION—FT. SMITH LIGHT & TRACTION COMPANY.

The Ft. Smith Light & Traction Company has recently built several rolling stock equipments in its shops at Ft. Smith, Ark. Among these is a construction car which measures 31 feet 6 inches long over all by 7 feet 6 inches wide. This narrow width was made necessary by local conditions, as was the short distance between truck centers, which is 22 feet. The side sills are 6 by 12 inches by 33 feet; center sills 6 by 8 inches; needle beams 6 by 8 inches; end sills 5 by 12 inches. The bolsters are built up of 1 by 6 inch iron. A motorman's cab 6 by 5 feet by 6 feet 6 inches is situated about 18 inches from one end. The trucks are Wason Manufacturing Company's No. 18 type, with a 6-foot wheel base. The motor equipment includes four Westinghouse No. 12-A 30-horsepower railway motors with a gear ratio of 14-68. One type K-12 controller is used. Peacock hand brakes are used in connection with an American Car Company's vertical wheel brake.

Other work which has recently been undertaken includes the reconstruction and enlargement of four single-truck closed cars. These cars were 31 feet long over bumpers and 8 feet 4 inches wide, mounted on two 4-inch axles. After much trouble and expense had been caused by broken axles it was decided to lengthen the cars and equip them with double trucks, and the first one has been completed. This car was cut in two at the center and a section 4 feet 9 inches long, the width of two windows, was spliced in. The car is now 37 feet 9 inches long and 8 feet 4 inches wide over all; length of body, 25 feet 9 inches; distance between truck centers, 17 feet; height from rail to trolley board, 12 feet 1 inch. The end frame is composed of steel I-beams, two 6-inch beams for side sills and two 4-inch beams for center sills. The latter extend from bumper to bumper. The bolsters are $\frac{5}{8}$ by 8 inch steel. The steel frame is riveted and bolted together and is a complete unit in itself. These cars will be equipped with Brill No. 27 G-1 trucks with 4-foot 6-inch wheel base, and two Westinghouse No. 38-B railway motors. The cars are to operate double-ended and have K-11 controllers and Peacock brakes.

The plans for the new and reconstructed equipments were drawn and the work executed under the charge of G. W. Chynoweth, foreman of the car house and shops of the Ft. Smith Light & Traction Company.

The Strang Gas-Electric Car Company's new steel passenger car "Irene," operated by a gasoline engine and a storage battery, made a test trip over the tracks of the Pennsylvania Railroad from Jersey City to Philadelphia on March 29 in 1 hour and 15 minutes

News of the Week

Trolley Trip from Chicago to New York.

Elliott Flower, representing the Chicago Tribune, started last Sunday on a trip from Chicago to New York, using electric railways as much as possible. By Thursday night he had reached Buffalo, having covered 783 miles, of which 132 were by steam road, at an expense of $14.70 for fares.

Mr. Flower's route by days, including Thursday, was as follows: Chicago to Kankakee, via the Chicago & Southern Traction Company; Kankakee to Lafayette, Ind., by steam road; Lafayette to Indianapolis, Terre Haute Indianapolis & Eastern Traction Company; Indianapolis to Dayton, Terre Haute Indianapolis & Eastern Traction Company and Ohio Electric Railway; Dayton to Toledo, Western Ohio Railway and Toledo Bowling Green & Southern Traction Company; Toledo to Cleveland, Lake Shore Electric Railway; Cleveland to Westfield, Cleveland Painesville & Eastern Railroad, Conneaut & Erie Traction Company, Buffalo & Lake Erie Traction Company; Westfield to Buffalo, steam road.

The Cleveland Situation.

Representatives of the city of Cleveland, the Cleveland Electric Railway and the Municipal Traction Company have been engaged for several days in deciding on the form of the lease under which the street railways are to be turned over to a holding company and it is stated that the draft of the lease is now practically complete. It has been definitely decided that the new company shall be called the "Cleveland Railway Company" and that the lease is to be so drawn as to make forfeiture almost impossible. No rate of fare will be specified.

On March 26 a plan was agreed upon for rebuilding the street railway tracks on Central avenue and Quincy street, which were torn up last year by the Cleveland Electric Railway after its franchise had expired, and on the following day the work of construction was begun by city employes. The plan was suggested by Mr. Goff after the Cleveland Electric Railway had refused to do the work unless granted a franchise. The track is to be owned by the Neutral Street Railway Company, organized by F. H. Goff and A. B. du Pont, president of the Municipal Traction Company, who are to furnish the money for the construction. Operating rights are to be granted to the Cleveland Electric Railway and the Forest City Railway at a nominal rental. A franchise owned by the Low-Fare Railway has been assigned to the new company.

Accident Frauds in Baltimore.

Bulletin No. 7 in the series which is being published in the daily newspapers by the United Railways & Electric Company of Baltimore discusses "accident frauds and ambulance chasers." The bulletin states that thousands of fraudulent claims are made, and gives two cases where dishonest claimants received jail sentences.

"Out of this hotbed of corruption," the bulletin states, "has sprung the so-called shyster lawyer or ambulance chaser." An abstract of a statement concerning "what this means to the public" follows:

"(a) The activities of the 'shyster lawyer' or 'ambulance chaser' do not cease with us. Everything is grist for his mill. He alleges that his client has been injured by a hole in the city streets and he sues the city. He discovers a claim against the thrifty mechanic or laboring man, and he levies upon the wage earner. He hears that a tradesman is a little behind in his settlements and he wrecks him by throwing him into the hands of a receiver.

"(b) He even finds his way into the home. Many a trifling quarrel between husband and wife, which would otherwise be forgotten in the course of time, is dragged by him into the records of the court.

"(c) Out of a total of nearly 1,000 cases on the January calendars of one of the three civil courts of Baltimore, to wit, the city court, over 80 per cent were damage suits.

"You, as a taxpayer, must pay the costs of judges and jurymen and all other costs which the litigants fail to pay, while hundreds of these false and frivolous cases absorb the time of the court and postpone the consideration of commercial cases and honest disputes."

Order Barring Newsboys from Cars Upheld.

The order of the Chicago City Railway prohibiting the sale of newspapers on its new pay-as-you-enter cars, which resulted in a newsboys' riot, instigated by the Chicago evening papers, on March 17 and 18, was completely upheld by Judge Goodnow of the municipal court on March 31 in the trial of several newsboys and others who were arrested for participating in the assault on the conductors, which was described in the Electric Railway Review of March 21. Two of the newsboys were released, others were turned over to the juvenile court, and John Burke, who, although not a newsboy, participated in the riot, was fined $50. The cases of two others who were arrested have been postponed until April 11.

A portion of the judge's instructions to the jury, which sustains the legality of the company's order, is as follows:

"The jury is instructed by the court that the Chicago City Railway Company has a legal right to prevent any person from selliug newspapers or any other article of merchandise on its street cars, and that no person has a right by force and violence to become a passenger on the street car for the express purpose of selling newspapers or any other article of merchandise on such street car; and if you find from the evidence that any person sought to become a passenger on such street car of the Chicago City Railway Company for the express purpose and with the express intention of selling newspapers on such street car, then the employes on such street car had the lawful right to prevent such person from becoming a passenger on such street car, whether such person tendered the payment of his fare or not."

The Chicago City Railway announces that it will adhere strictly to its rule, stating that the rule barring newsboys from the new cars has received the support of the company's patrons, the city administration and the company's employes.

Calumet & South Chicago Railway Ordinance Passed.

The ordinance extending the franchises of the Calumet Electric Street Railway and the South Chicago City Railway from 1912 and 1915 to 1928 and providing for a consolidation of the two companies under the name of the Calumet & South Chicago Railway was passed by the Chicago city council on March 30. The ordinance is very similar in its provisions to the franchise extension ordinances of the Chicago City Railway and the Chicago Railways Company. The city is to receive 55 per cent of the net receipts after operating expenses, taxes and depreciation have been deducted from the gross receipts, and may purchase the property for municipal operation upon six months' notice, for the present value, which is fixed at $6,000,000, plus the amount expended for improvements and a 12 per cent bonus. The Chicago City Railway may also purchase the property on the same terms.

The company is required to completely rehabilitate its property within 3½ years and to begin the reconstruction of 40 miles of new track at the expiration of one year from the date of acceptance of the ordinance. Seven specified extensions are to be completed before January 1, 1910, 15 new cars are to be purchased with a year and as many more thereafter as may be determined by the board of supervising engineers.

The board of supervising engineers, which is to have supervision over all of the rehabilitation and extension work and to prepare plans and specifications for such work, is to have duties and powers similar to the board for the Chicago City Railway and the Chicago Railways companies. The board will be composed of three members, of whom one is to be appointed by the city and one by the company. Bion J. Arnold is named as the third member and chairman of the board. He will also act as chief engineer of the rehabilitation work.

The company is authorized to operate express as well as passenger cars. Provision is made for an interchange of transfers with the Chicago City Railway by establishing four transfer zones. In the first transfers are to be exchanged after four months. In the second the council may require an exchange of transfers after one year and four months, provided the net earnings for the year amount to 5 per cent on the investment and the company's share of the net earnings amounts to 1¼ per cent on the investment. The exchange of transfers may be extended to the third and fourth zones under the same provisions.

Transit Affairs in New York—Brooklyn Subway Approved.

The forms of contract for the Brooklyn Fourth avenue subway were approved on March 26 by the board of estimate, which thus authorized the public service commission for the first district to prepare for the construction of the entire six sections of the subway. The route extends from the Brooklyn end of the Manhattan bridge under Fulton street to Ashland place and thence under Fourth avenue to Forty-third street. The estimated cost of construction is $15,000,000, with about $6,000,000 additional as the cost of the real estate to be acquired. A special committee appointed to consider the matter submitted a report recommending the construction of only the first section, on the ground that the city's finances would not permit the construction of the entire subway. B. S.

Coler, president of the borough of Brooklyn, then submitted a resolution authorizing the construction of the entire route. This resolution was adopted in spite of the opposition of Comptroller Metz and Mayor McClellan, who insisted that the required bonds for the subway could not be issued under the city's debt limit.

The public service commission at once passed a resolution authorizing the preparation of the advertisements for bids. The acting corporation counsel on March 30 found the contracts for the subway correct in form, but withheld his formal indorsement of approval because of the apparent lack of appropriation to complete the work. The public service commission has taken the approval of the form of contract as sufficient and has announced that it will begin advertising for bids on Monday, April 6, the time limit for receiving bids being May 8. Bids will be received for construction alone. Arrangements for equipment and operation will be made later. The plans call for a 4-track road, to be excavated under cover, and two years is allowed for the completion of the contract. Bids for the construction of pipe galleries will be received separately. Contracts for the construction of the subway may be awarded within 20 days from the date of receiving the bids, although Comptroller Metz states that the city cannot provide the necessary funds and that he will probably refuse to certify the contracts.

The public service commission has issued an appendix to its annual report, which deals with the relation of the constitutional debt limit of the city to subway construction, and advocates the passage of a bill by the legislature eliminating from consideration in regard to the debt limit all bonds already issued for subway construction so long as the revenue produced by the subways built shall be sufficient to pay the interest on the bonds and provide a sinking fund for their redemption. The existing subway, the commission points out, was authorized by the rapid transit act of 1891, but it was 10 years before the actual work of construction was begun and three years later that the subway was opened for public use. Chief of the hindrances to the beginning and completion of the work was the ever-recurring question of the debt limit.

The appendix reviews the history of the debt limit legislation to show that its object was to prevent the placing of burdens upon the taxpayers, and points out that bonds of such investments as subways and water supply, etc., are not a burden on the city, but are an actual advantage, which produce sufficient revenue to pay not only the ordinary expenses of maintenance and operation, but also the interest and sinking fund charges and perhaps a profit besides.

Chief Engineer Withington of the city finance department on March 27 submitted a report to Comptroller Metz on the request made recently by Bridge Commissioner Stevenson for authority to let a contract for the reconstruction of the Manhattan approach of the Brooklyn bridge, in order to provide a means for running the bridge trains into the new subway loop connecting the Brooklyn and Williamsburg bridges, which is now under construction. Mr. Withington objected to the plan because the heavy grade would require that all trains using the loop be composed of motor cars. He also doubted whether Mr. Stevenson's plan would lessen the congestion of the bridge.

Legislation Affecting Electric Railways.

Maryland.—The legislature has passed an amendment to the present race separation law, extending its provisions to apply to electric railways operating for more than 20 miles outside of the limits of a city.

Massachusetts.—Acting Governor Draper has signed the law allowing street railway companies to install temporary tracks under certain conditions in the event of bridges being repaired. The new law provides that if a bridge upon which a street railway company is authorized to lay and use tracks is being or is to be improved or repaired, the aldermen or selectmen upon petition of the company may grant a temporary location for extension of the company's tracks in any streets so as to provide connection between the existing tracks on each side of the bridge. In case of failure of the local authorities to grant this permission the street railway may appeal to the railroad commission.—The railroad commission has sent to the legislature an answer to inquiries regarding the proposed consolidation of the West End Street Railway with the Boston Elevated Railway, which is provided for in a bill now pending. The board states that the consolidation would be consistent with the public interests provided certain safeguards which it suggests be inserted in the bill; that the Boston Elevated shall be subject to all duties, liabilities and obligations of the West End company under existing laws, that the Boston Elevated shall not acquire any additional rights or privileges except such as are expressly granted by the act, and that the facilities for travel on the lines of each company shall not be diminished or the rates of fare increased by reason of the act. The bill has been favorably reported by the committee on street railways.

New Jersey.—The house has passed a bill requiring the West Jersey & Seashore Railroad to protect its third rail to a distance of 75 feet on each side of all grade crossings. An amendment requiring that the third rail be protected throughout its entire length was defeated.

New York.—A bill has been introduced in the legislature to repeal a present law which prohibits the construction of a railroad, steam or electric, on the so-called South Shore road on Long Island, between Bay Shore and Patchogue.—The assembly has passed the railroad committee's bill, drafted as a substitute for the Wagner 5-cent fare bill, which prohibits street railways from charging more than a 5-cent fare, unless authorized to do so by the public service commission. The bill is intended to prevent the Brooklyn Rapid Transit Company from charging more than five cents fare from New York to Coney Island.—The senate judiciary committee has reported a bill, introduced by Senator Grady, which requires the unanimous consent of the stockholders to effect a consolidation of two or more street railways in New York City. The bill is said to be in the interest of minority stockholders of the New York Westchester & Boston Railway and the New York & Portchester Railroad, which are both controlled by the New York New Haven & Hartford Railroad.

Ohio.—The house on March 27 voted to postpone indefinitely consideration of the Stockwell bill, which permits cities to own or acquire street railways, but not to operate them.

To Remove Old Tracks in St. Louis.—The United Railways Company of St. Louis has agreed to remove about seven miles of unused tracks in the city and to repave the streets.

Western Society of Engineers.—At a meeting of the Western Society of Engineers, held in the society rooms in the Monadnock block, Chicago, on April 1, W. M. Torrance presented a paper, illustrated by lantern slide views, on "Reinforced Concrete Structures in Hudson River Tunnel Work."

Date of New York Meeting Changed.—The executive committee of the Street Railway Association of the State of New York has announced that the date of the annual meeting has been postponed to June 30 and July 1. The place is the same as announced previously, at the Clifton hotel, Niagara Falls, Ont.

American Institute of Electrical Engineers, Toledo Section.—At the regular monthly meeting of the Toledo branch, held on Friday evening, April 3, 1908, in the Builders' exchange at Toledo, O., T. R. Fishbeck of the Electric Controller & Supply Company, Cleveland, O., presented a paper on "Lifting Magnets and Their Application." The lecture was illustrated with lantern slides and a practical demonstration.

Reduction of Wages Proposed.—Press reports state that the motormen and conductors of the Pittsburg Railways Company threatened on March 31 to strike rather than accept a proposed reduction of wages of three cents an hour. An agreement between the company and its employes was finally reached, however, under which the present wage scale of 25, 26 and 27 cents an hour is to be continued until April 7, in order that a settlement may be made in the meantime.

Trial Trip on the Washington Baltimore & Annapolis.—J. N. Shannahan, vice-president and general manager of the Washington Baltimore & Annapolis Electric Railway, Washington, D. C., in company with his principal assistants, representatives of the Roberts & Abbott Company of Cleveland, O., and of the Fidelity Construction Company of Detroit, Mich., made a trial trip over the new road last week from Washington, D. C., to Baltimore, Md. This was the first car to reach the Baltimore terminal of the line.

Readjustment of Fares Needed in Massachusetts.—At the annual meeting of the New England Street Railway Club, Boston, on March 26, an account of which was published in last week's issue of the Electric Railway Review, James F. Shaw, first vice-president of the American Street and Interurban Railway Association, warned those present that the income on electric railway investments, in New England, was not sufficient to induce investors to devote any more money to the development of that industry. He added: "I believe the low rate of income in Massachusetts can be materially increased by a readjustment of fares, either by increasing the fare unit or by shortening the fare limits, and by limiting the use of transfers, and also by the development of the express business, which will not only benefit the street railways but the whole community."

Traffic and Transportation

To Discontinue Transfers Between New York City Railway and Third Avenue Road.

Judge Lacombe of the United States circuit court, New York, has rendered a decision that transfers between most of the lines of the New York City Railway and of the Third Avenue Railroad may be abolished after April 11.

Judge Lacombe's decision was rendered upon an application made by the receiver for the Third Avenue road and the receivers for the Metropolitan and New York City Railway companies for instructions. Judge Lacombe says:

"As a business proposition it is sufficient to refer to the detailed statement of conditions set forth in the petitions submitted on this application. It is obvious that a curtailment of transfer privileges in the manner suggested will increase the cash receipts of the properties affected, and since receivers are trustees for the creditors and owners their duty to operate the roads so as to increase earnings is equally obvious."

With several exceptions Judge Lacombe finds no legal reason why the transfers should not be discontinued.

The petition filed by Receiver Frederick W. Whitridge of the Third Avenue road says that he desires to maintain the transfer system between the Third Avenue road and its branches so as "to assist in building up a system of roads better fitted to compete with the Metropolitan system."

Mr. Whitridge has found upon investigation that for the month ending February 15 the Third Avenue road carried 4,067,618 passengers, of whom 2,944,341 paid their fares in money and 1,123,277 paid with transfer tickets obtained on other lines. He is confident that with the abolition of transfers the earnings of the Third Avenue road would be increased by 10 to 20 per cent.

"Public opinion may dislike, but I think it will not fail to justify, the abandonment of the transfer system," says the receiver. "We have been industriously educated to believe that great combinations and monopolies such as the New York traction system was, are abominable evils, but they have afforded the public some advantages, as in this case the transfer system, and fair-minded persons will hardly expect to retain the advantages of a monopoly after the combination which effected it has been destroyed and competition restored. Competition is, intelligent people now generally agree, except when it occasionally becomes ruinous, expensive for everybody.

"In this case the Third Avenue Railroad is owned, operated and will doubtless be reorganized, wholly independently; it is no longer a part of a monopoly, and it cannot afford to offer to its patrons any of the advantages of a monopoly. The additional administrative expenses necessitated by its independent condition will be many thousands of dollars annually, and the company needs all the sources of revenue which it formerly had to meet them, and I cannot doubt that the press and the public will be quick to recognize this fact and will cheerfully pay their fares in cash, when they realize that the transfer system is ruinous to the company, a temptation to its employes and demoralizing to the public itself."

Mr. Whitridge included in his petition the statement of one of his employes, who tells how he rode all day long, from 10 o'clock in the morning until after 6 o'clock at night, on 10 cents and rode to Hoboken through the McAdoo tunnel and back besides. He had to spend the extra five cents to get a northbound transfer. The southbound slip, he found, would carry him almost anywhere east, west and south. He managed to do a little shopping and to eat dinner in between.

Increased Service Orders in New York.

The New York public service commission, first district, has passed an order requiring the Interborough Rapid Transit Company to increase the service on the Second avenue elevated line.

The commission has given the Third Avenue Railroad an extension of 30 days in which to complete the overhauling of its summer cars.

At a hearing before the New York public service commission, first district, regarding a tentative order for an increase in the number of cars on certain lines, Arthur N. Dutton, superintendent of transportation of the Brooklyn Rapid Transit system, protested against the methods followed by the commission in ordering increased service. Mr. Dutton said that the public service commissions law did not intend that it should be within the province of the commission to make hard and fast orders as to the number of cars that should be operated on a given line, but that when the commission determined that increased service was needed it should issue an order to that effect and allow the company to work out the details. Mr. Dutton added that schedules could not be fixed by set rules because traffic conditions differed from day to day.

Fare Increases in Massachusetts.

The Connecticut Valley Street Railway of Greenfield, Mass., has increased its fares to a number of points, effective on April 1. The company announces that the object of the revision of fares is to bring, as nearly as possible, the four divisions of the property to a common earning capacity per car-mile. For the year ending September 30, 1907, the average earning capacity of the system per car-mile was 19.2 cents. The Amherst division averaged 22 cents, the Deerfield division 17.8 cents, the Greenfield division 23 cents and the Millers Falls division 14 cents. The management states that to obtain the desired result in the past various experiments of reduced fares with a view to increasing the traffic have been tried.

Illinois Traction System Rates.

A new timetable of the Illinois Traction System, issued by B. R. Stephens, general traffic manager, Springfield, contains 20 pages. Each Saturday and Sunday, until further notice, the following special rates will be in force: Round trip between East St. Louis and points between Millwood and Springfield, $1.50; round trip between East St. Louis and Carlinville, $1.25; round trip between East St. Louis and Gillespie and Benld, $1; round trip between East St. Louis and Mt. Olive, Litchfield and Hillsboro, $1. "These low rates," the timetable states, "are made to introduce our service to the public. A trial will demonstrate the possibilities and pleasure of long distance interurban service." Other information is given as follows:

"The rates on the system are, as near as practicable, based on 2 cents per mile in one direction, with lower rates for round-trip tickets. Also $10 fare books, which practically cover 500 miles of travel, are on sale at all ticket offices at $7.50 net. The books are unlimited and are issued to individuals or families or firms. The $5.00 fare books are sold for $3.75 net, issued to individuals and good for six months. They have become a household necessity along our lines.

"Commutation books, limited to 30 days, 52 rides to a book, are sold at the rate of 1 cent per mile, with a minimum of 5 cents per ride or $2.60 per book. This rate is given only on condition of using the 52 rides during continuous 30 days, and no extension of time or refund on coupons is given."

Reasons for Fare Increases in Massachusetts.

The Newton (Mass.) Street Railway and the Newton & Boston Street Railway, which have increased their units of fare from 5 to 6 cents, have sent an explanatory statement to people living on the lines of the companies, which says in part:

"The following facts have brought about present conditions: (1) The wages paid by the companies are very much in excess of those paid a few years ago. (2) The cost of all materials used in construction and operation of a street railway has increased in a varying ratio from 20 to 100 per cent. (3) The distance which patrons can ride for one unit of fare has been steadily increasing by extensions of fare limit points and added transfer facilities. (4) The roadbed and equipment have been gradually and constantly wearing out, with the inevitable result of necessary replacement. (5) Increased burdens have been placed upon street railways by municipalities at the times of added construction.

"Although the wages paid by the companies are very much higher than those paid a few years ago, the management decided not to reduce the wages of its employes, and thereby, possibly, render poorer service; believing that the people, as a whole, prefer good service at a reasonable rate to poor service at a cheap rate.

"It has been impossible for the street railways to market their securities in the recent past because of their very poor and unsatisfactory financial showing. The credit of the companies has been stretched to the limit and their borrowing power is practically exhausted.

"The book value of the Newton & Boston Street Railway on November 1, 1907, was $545,408, and the appraised value of the property (such appraisal having been made by G. M. Thompson, engineer, who has no connection with the company), as of December 24, 1907, is $514,941. The total salaries paid the officers of the company per year are $745.33. The president serves without salary, and the directors give their time without compensation.

"The book value of the Newton Street Railway on November 1, 1907, was $2,031,971, and the appraisal value by Mr. Thompson as of December 24, 1907, was $2,030,167. The total salaries of its officers per year are $3,613. The president serves without salary, and the directors receive no compensation."

Construction News

FRANCHISES.

Edmonds, Wash.—The Seigfriedt syndicate has applied to the county commissioners for a franchise to build an electric railway in Edmonds and on to Bitter Lake.

El Paso, Tex.—Capt. Thomas A. Davis, president of the El Paso military institute, has applied for permission to build an electric railway from El Paso to the institute by way of Ft. Bliss.

London, Ont.—The Southwestern Traction Company has secured an extension of time in which to complete its line from London to Ingersoll, Ont. The North Midland Railway Company also secured an extension of two years.

St. Louis, Mo.—The extension of one year recently asked for by the St. Louis Electric Terminal Railway in which to complete the entrance into St. Louis for the Illinois Traction System, has been granted. (Noted March 7.)

RECENT INCORPORATIONS.

Chicago Inland Traction Company.—Incorporated in Illinois to construct an electric railway from Crete to Kankakee, Ill., passing through Goodenow, Beecher, Soliett, Grant Park and Momence, following the Kankakee river from Momence to Kankakee, a distance of 32 miles. Right of way is being secured. It is stated that a portion of the road will be completed by next September. Capital stock, $900,000. Incorporators: Dr. Edward Doepp, Blue Island; C. W. Rhodes, Elmer Schlesinger, Edwin D. Lawler, Chicago; H. C. Bangs, Glencoe, Ill.

Chicago Ottumwa & Western Railway, Bussey, Ia.—Incorporated in Iowa to build an interurban railway from Ottumwa to Des Moines, Ia. Capital stock, $3,000,000.

Ellwood City & Wurtemburg Electric Railway.—Incorporated in Pennsylvania to build a 3-mile electric line in Lawrence county. Capital stock, $18,000. Incorporators: J. T. Macklin, president, Frisco, Pa.; John M. Curry, S. R. Turner, J. N. Kirker, S. C. Van Gorder, H. G. French, J. H. Newton, Wurtemburg; J. Z. French, A. Tortier, Ellwood City, Pa.

TRACK AND ROADWAY.

Anderson & Athens Electric Railway.—It is stated that the location survey for this proposed 73-mile electric line from Anderson, S. C., to Athens and Hartwell, Ga., has been started. De Camps & Cunningham, Anderson, S. C., have the contract for the work from Anderson to Hartwell, and the Richardson-Wey Engineering Company, Atlanta, Ga., has begun work from Cannon, Ga.

Atlanta & Carolina Railway, Atlanta, Ga.—A force of men is now at work at the Atlanta end of this proposed electric railway and another force will be put on at Augusta this week. Right of way is said to have been secured for the entire distance and it is believed that the line will be completed within a year. After entering Augusta it is planned to operate the cars of the company over the tracks of the Augusta Railway & Electric Company to the present terminal of the Augusta & Aiken line. (Noted March 14.)

Benton Harbor-St. Joe Railway & Light Company, Benton Harbor, Mich.—This company has agreed to pay one-third of the cost of a $60,000 bridge over the St. Joe river, connecting St. Joe with Benton Harbor. The remainder of the cost will be shared equally by the cities.

Canton, O.—It is announced that the Massillon Wooster & Mansfield Traction Company and the Massillon & Northern Railway will be consolidated and their construction undertaken by a new company. From Massillon to Newman, O., six miles, both lines will use the same tracks. From Newman one branch will extend to Dalton and Mansfield, while the other will go to Turkeyfoot lake, where a summer resort will be established.

Chambersburg Greencastle & Waynesboro Street Railway, Waynesboro, Pa.—This company has awarded the contracts for the transmission line between Greencastle and Chambersburg and for the substation at Marion to the J. G. Schaff Electrical Company, Chambersburg, and the Westinghouse Electric & Manufacturing Company. J. MacWolff, general manager, Waynesboro. (Noted February 15.)

Chicago City Railway.—The Chicago board of supervising engineers has issued an order for the reconstruction work to be completed by the company this year under the provisions of the franchise ordinance. The work includes the reconstruction of 43¼ miles of track with 129-pound grooved rails at an expense of $2,112,000 and conduit construction amounting to $316,000. Besides several crosstown lines the Cottage Grove avenue line north of Thirty-ninth street and the State street line between Fifty-fifth and Twelfth streets will be rebuilt. The tracks on Michigan avenue forming a part of the loop at the northern terminus of the Wabash avenue line are to be removed and a new loop constructed using Garland court.—The city council has passed an ordinance authorizing this company to extend its Kedzie avenue line from Twelfth street to Twenty-second street and its Fullerton avenue line from Milwaukee avenue to Fortieth avenue.

Cleveland Brooklyn & Elyria Railway, Cleveland, O.—J. J. Breitinger, vice-president, has announced that financial arrangements have been made for building the line between South Brooklyn and Orrville, O., this year and that next year the line will be extended to Zanesville, with a branch from Strongsville to Elyria. Right of way is said to have been obtained between Cleveland and Zanesville. The company expects to use the Westinghouse single-phase system. According to the plans the Cleveland Brooklyn & Elyria will be absorbed by a new company, the Cleveland Orrville Coshocton Zanesville & Elyria Railway, with W. E. Brooks of Elyria as president and J. J. Breitinger of Cleveland as vice-president.

Connecticut Company, New Haven, Conn.—The Connecticut railroad commissioners have approved the proposed method of construction of the line from Woodbury to Waterbury, Conn. (Noted July 27, 1907.)

El Reno Railway, El Reno, Okla.—One mile of track has been laid in El Reno since January 1 of this year. Henry Schafer of El Reno is interested. Officers have not yet been elected.

Evansville & Southern Indiana Traction Company, Princeton, Ind.—It is stated that the 4-mile extension of this line under construction to Patoka, Ind., will be completed within the next six weeks. Charles M. Murdock, secretary of the company, is reported as announcing that the building of the proposed extension north to Vincennes has been abandoned for the coming year.

Evansville (Ind.) Terminal Railway.—It is expected that grading for the line between Evansville and Newburg, Ind., nine miles, will be started about May 1. Contracts for the bridge work have been let. The company is a subsidiary of the Evansville Railways Company, which has been operating between Evansville and Newburg over the tracks of the Evansville Suburban & Newburg Railway. (Noted March 14.)

Idaho Oregon & Washington Electric Railway.—It is announced that Frank McKean, representing this company, has placed orders for 1,000 tons of steel rails and 40,000 pounds of copper wire to be used in the construction of the first 10-mile section of its proposed electric line from Lewiston, Idaho, to Clarkston, Asotin and Pomeroy, Wash. The rail order was placed with the Colorado Fuel & Iron Company and the wire order with the American Steel & Wire Company for delivery in June. (Noted February 8.)

Indianapolis & South Bend Traction Company, Indianapolis, Ind.—E. Bowman, president, writes that the route for this proposed electric line has been surveyed from Logansport to Burlington, 20 miles. The remainder of the route from Burlington to Indianapolis, 51 miles, is under survey and practically all of the right of way has been secured. Plymouth, Rochester, Logansport, Burlington and Sheridan are on the route, with Indianapolis and South Bend as its termini. The headquarters of the company are at 730 State Life building, Indianapolis. J. Shafer is chief engineer. O. H. Mann, secretary, Sheridan, Ind. J. H. Keller, treasurer, Indianapolis. (Noted February 15.)

Indianapolis Newcastle & Toledo Electric Railway, Indianapolis, Ind.—It is reported that the creditors' committee has agreed to a plan whereby the receivers will issue $400,000 of receivers' certificates to complete the road between Indianapolis and Newcastle. Thirty miles of track had been laid when work was stopped last fall. The Union Trust Company of Indianapolis is acting as receiver. (Noted November 30, 1907.)

Jacksonville, Tex.—H. L. Norton of Boston, Mass., who is promoting an interurban line from Jacksonville to Dial, Rusk and Tyler, Tex., has secured a franchise in Jacksonville.

Janesville, Wis.—H. H. Zeigler, Columbus, O., who is interested in a proposed interurban railway from Janesville to Madison, Wis., is reported as saying that construction work

will be started immediately. Joseph Ellis and W. L. Jamison of Cincinnati, O., are the engineers. When completed the road will afford direct trolley connection from Madison to Chicago.

Kansas City & Southeastern Railroad, Kansas City, Mo.—Surveys for this proposed electric line have been completed and the right of way secured. The line will be 30 miles long and will extend in a southeasterly direction from Kansas City, serving the towns of Leeds, Raytown, Lees Summit, Cockrell and Lone Jack, Mo. Gasoline-electric cars will be operated. Charles A. S. Sims, president; H. W. Gibson, vice-president; B. F. Shouse, treasurer; George P. Norton, general attorney; all of Kansas City, Mo.

Kansas City, Mo.—J. B. Quigley, chief engineer of a proposed electric railway from Ava, Douglas county, north to Cedar Gap, Mo., where a connection will be made with the St. Louis & San Francisco Railroad, advises that surveys for the entire distance of 15 miles have been completed and that grading will be started about April 15. The power house equipment will include a 300-kilowatt three-phase 60-cycle 6,600-volt alternator, direct connected to a water turbine, and two motor-generator sets. Contracts for rails, ties, steel, water power plant, auxiliary steam plant of 200-kilowatt capacity, grading, etc., will be let within the next 30 days. The headquarters of the company are at 309 Dwight building, Kansas City, Mo.

Kentucky & Ohio River Interurban Railway, Paducah, Ky.—It is reported that this company will build an electric railway from Paducah, Ky., to Cairo, Ill., and that the Royal Investment Company of Minneapolis has purchased $1,000,000 of the company's bonds. (Noted June 29, 1907.)

La Crosse (Wis.) City Railway.—This company will replace a portion of its present special track work with intersections having Manard special hard steel centers, furnished by the Pennsylvania Steel Company. The entire track system will also be rebonded with Electric Service Supplies Company's "Protected" rail bonds. G. H. Shaw, superintendent.

Lake Shore Electric Railway, Cleveland, O.—It is announced that an extension will be built from the present terminus of the company's branch line at Gibsonburg to Helena, a small town in the oil district. F. W. Coen, general manager, Norwalk, O.

Montgomery & Chester Electric Railway, Phoenixville, Pa.—This company has completed a viaduct over the tracks of the Philadelphia & Reading Railway at Ironsides, Pa., thus completing the connection between Phoenixville and Spring City, which has been delayed for several years on account of the refusal of the steam road to let the electric line cross its tracks.

Mt. Hood Railway & Power Company, Portland, Ore.—This company, which proposes to build an electric railway from Portland to Mt. Hood, has begun proceedings to condemn a right of way across the Bull Run reserve, which is owned by the city of Portland. The city council recently refused to grant the company a franchise to cross the reserve.

Pana Girard & Jacksonville Railway.—At a recent meeting of the stockholders held at Springfield, Ill., the following officers were elected: C. E. Sargent, president; J. N. Anderson, vice-president; B. V. F. Darneille, secretary; J. J. Stowe, treasurer. The road will pass through Pana, Girard and Jacksonville, Ill., connecting with the lines of the Illinois Traction System at Pana. Work on securing franchises and right of way will be started at once. (Noted March 21.)

Pittsburg Canonsburg & Washington Electric Railway, Pittsburg, Pa.—Engineers have started surveys for the construction of this line from Washington to Pittsburg, Pa., 31 miles. A portion of the grading contracts have been let. The company is a subsidiary of the Pittsburg Railways. F. Uhlenhaut, president. (Noted February 29.)

Prosser (Wash.) Traction Company.—Preliminary surveys for this proposed electric railway from Prosser to points west and south in the Columbia river valley will be started at once from Prosser to Paterson, Wash. At Prosser the line will connect with the North Coast Railroad, which is building from North Yakima toward Prosser. Frederick Finn, president, Prosser, Wash. (Noted January 25.)

Puget Sound Electric Railway, Tacoma, Wash.—Work was started by this company on March 1 on the construction of an extension from Brookville to Puyallnp, Wash., about seven miles. The contract for a 200-foot span bridge over the Puyallup river has been let to the American Bridge Company. W. S. Dimmock, manager, Tacoma. (Noted February 15.)

Richmond & Winchester Interurban Railway, Richmond, Ind.—M. M. Lacey, secretary, writes that this company proposes to build a 25-mile electric line from Richmond to Winchester, Ind., passing through Wayne and Randolph counties and serving Chester, Fountain City, Lynn, Snow Hill and Woods. Stock is being subscribed for purposes of incorporation, making surveys and obtaining right of way. It is planned to start construction some time during the summer.

San Francisco Oakland & San Jose Railway, Oakland, Cal.—Plans are being prepared for the extension from Oakland to San Jose, Cal., and it is stated that construction work will begin within two or three months. W. F. Kelly, general manager.

Spokane & Inland Empire Railroad, Spokane, Wash.—Work has been started on the grading of this company's extension from Palouse, Wash., to Moscow, Idaho, and it is expected that the roadbed will be ready for tracklaying by summer.

West Chester & Wilmington Electric Railway.—President Thomas E. O'Connell of Wilmington, Del., is reported as saying that actual construction work would be started on this proposed line at once. Right of way is being secured and it is expected to have cars running from Wilmington to Lombardy cemetery, three miles, by May 30. An extension will be built later to Brandywine Summit. It is stated that traffic arrangements may be made with the Wilmington City Railway Company, so that the cars may operate over the Concord pike instead of along a new road parallel with the pike. (Noted March 21.)

Winnebago Traction Company, Oshkosh, Wis.—It is reported that this company is contemplating an extension of the Oshkosh-Omro line to Berlin, Wis. E. Gunter, chief engineer.

Winona Interurban Railway, Winona Lake, Ind.—Grading has been resumed at Mentone and at a point just south of Warsaw, Ind., on the extension from Peru to Warsaw. Rails, ties and copper wire have been purchased and it is expected that the roadbed will be ready for tracklaying about the middle of May. It is intended to push the work and have the entire line completed in time to care for the heavy passenger traffic at the time of the Winona assembly late in the summer. S. C. Dickey, general manager, Winona Lake, Ind. (Noted February 8.)

POWER HOUSES AND SUBSTATIONS.

Indianapolis Columbus & Southern Traction Company, Columbus, Ind.—This company has contracted with the Allis-Chalmers Company for a 1,000-kilowatt revolving field engine type generator, 25-cycle, three-phase, 370-volt, to be installed in the power house at Edinburg.

Mt. Hood Railway & Power Company, Portland, Ore.—It is announced that this company soon will let contracts for hydraulic and electrical equipment. C. W. Miller, general manager, Portland, Ore.

Northwestern Elevated Railroad, Chicago, Ill.—Construction has been started on a new substation, located on Clark street, south of Calvary cemetery. Current from this station will feed the Evanston extension of the service over the tracks of the Chicago Milwaukee & St. Paul Railway, now being reconstructed.

Nashville (Tenn.) Railway & Light Company.—W. G. Cameron, chief engineer, writes that this company is now installing a 3,000-kilowatt Curtis turbine, which is the third turbine of this size in the power house. A forced draft ventilation system is also being installed, which will enable increasing the capacity of each turbine from 3,000 to 5,000 kilowatts.

New York New Haven & Hartford Railroad, New Haven, Conn.—It is reported that contracts will be let during the spring or early summer for the erection of a large power house at Milford, Conn., on the Housatonic river, similar to the plant at Cos Cob.

Twin City Rapid Transit Company, Minneapolis, Minn.—E. H. Schofield, engineer of power and equipment, writes that this company is now erecting a substation of a capacity to accommodate two rotary units of 1,500-kilowatt capacity each, one of which will be installed immediately. The external dimensions of the building are 47 feet 10 inches by 44 feet 5 inches by 30 feet high. The construction work of the building is being done by the John Wunder Company, general contractors, Minneapolis. The rotary and switchboard equipment is being furnished by the General Electric Company. The St. Anthony Falls Water Power Company is now equipping a new hydraulic power plant, which will furnish power for the Twin City Rapid Transit Company.

Personal Mention

Mr. L. H. McCray, who recently resigned as superintendent of the Sterling Dixon & Eastern Electric Railway, Dixon, Ill., has been appointed trainmaster of the Atlantic Shore Line Railway at Sanford, Me., effective on March 31.

Effective on April 1 the offices of superintendent of telegraph and telephone and signal engineer of the Waterloo Cedar Falls & Northern Railway Company, Waterloo, Ia., will be abolished and the duties of these offices will be performed by the superintendent of overhead lines. Mr. A. I. Woodring, chief electrician, has been appointed to fill the new position and will have charge of all the overhead work, power transmission lines, battery station, rotary substation and telegraph and telephone work of the company.

Effective on April 1 the departments of employment and inspection of the Brooklyn Rapid Transit Company, which for a number of years have been combined under one head, will be separated. Mr. Frank Cooley, superintendent of the combined departments at present, will have charge of the inspection service of the system, reporting to Mr. J. F. Calderwood, vice-president and general manager. Mr. J. T. Crabbs will have charge of the employment department and will report to Mr. A. N. Dutton, superintendent of transportation.

Mr. W. S. Hubbard, whose appointment as division engineer of the Indiana Union Traction Company's lines, northern division, was announced in the Electric Railway Review of March 21, has been with the company since 1903, when he started in as rodman on the engineers' corps. In 1904 he was made timekeeper on construction work and later foreman of the steam shovel construction forces. In 1906 he was promoted to be chief clerk of the roadway department, with headquarters at Anderson, and on March 1 of the present year was made division engineer of the northern division, with headquarters at Tipton, Ind. In his new position he has charge of roadway and buildings on the lines from Indianapolis to Logansport, from Kokomo to Peru, from Tipton to Alexandria, and on the city lines of Elwood, Ind., comprising in all 120 miles of interurban and 15 miles of city lines.

Mr. Adolph M. Barron has been appointed general manager of the Citizens' Electric Railway, Eureka Springs, Ark., effective on March 1. Mr. Barron was born on October 22, 1856, at Milwaukee, Wis., and after finishing a common school education took a course in telegraphy. From 1872 to 1878 he was employed on various railroads as telegraph operator, railroad agent, express agent and train dispatcher, and from 1879 to 1895 was identified with the construction and operating departments of various telegraph companies. He later went to Joplin, Mo., as superintendent of the Southwestern Water Power & Light Company, returning to Kansas City as superintendent of the Commercial Telegraph Company. His experience in the management of various light, power, water and gas plants has been considerable, covering the period from 1895 to 1900 and including properties at Elkhart and South Bend, Ind., and Chicago, Ill., at the latter city serving as consulting engineer for bond companies in Chicago, Cincinnati, New York and other eastern points. In 1904 he again went to Joplin, Mo., in charge of the Southwest Missouri Light Company and the Missouri Ice Company, these and other properties of that section being merged while under his management, and was one of the incorporators of the Consolidated Light Power Water & Ice Company, which furnished service to the cities of Joplin, Webb City and Carterville, Mo., and Galena, Kan. He severed his connection with this company in 1906 to engage in the hotel business at Carterville, Mo., where he remained until 1907, when he accepted the position of general manager of the Citizens' Electric Company at Eureka Springs, Ark., as earlier stated. Mr. Barron has been identified with the water, light and gas associations of the country, including the National Electric Light, the Western Gas, the American Waterworks, the Northwestern Electric Light and the Indiana Public Utilities associations, the last two of which he served as vice-president and secretary, respectively.

Adolph M. Barron.

Mr. Albert L. Neereamer, who has been elected chairman of the Central Electric Traffic Association and secretary of the Central Electric Railway Association, will make his headquarters in Indianapolis. As mentioned in the Electric Railway Review of last week, Mr. Neereamer was secretary of the Columbus passenger committee, a traffic organization of steam roads, for eight years. From 1883 to 1903 he was connected with the accounting and traffic departments of various steam railways. He was elected general agent at Columbus for the Columbus Delaware & Marion Railway in 1903, and served successively as general passenger agent, traffic manager and general superintendent of that company. Mr. Neereamer resigned from the latter office on January 15, 1908.

Albert L. Neereamer.

Mr. G. C. Pierce, for the past two years general superintendent of the East St. Louis & Suburban Railway properties at East St. Louis, Ill., has resigned on account of ill health and hereafter will devote his time to less exacting labors in the field of engineering operations. Mr. Pierce asked to be relieved in January, but at the solicitation of Vice-President L. C. Haynes remained until the return of President Clark from California, when a successor could be chosen. Mr. Pierce and his wife will start within a few days on a pleasure trip through the west. He will be succeeded at East St. Louis by Mr. C. F. Hewitt, general superintendent of the St. Joseph (Mo.) Railway Light Heat & Power Company. Mr. Hewitt has been identified with the operating department of the Clark properties, of which both of the above-named companies are a part, for several years, and has had wide experience in the practical operation of railway and lighting properties.

OBITUARY.

Robert Hough, manager of parks for the United Railways & Electric Company, Baltimore, Md., died last week. He had been identified with the work since 1895, having received his appointment from the old Baltimore Traction Company. Mr. Hough served during the war as an officer of the Confederate army.

Charles A. Kenworthy, superintendent of the Electric Package Company of Cleveland, O., died recently. Mr. Kenworthy had had an extensive experience in the express business and when the Electric Package Company was formed in 1898 by the Cleveland interurban roads he was appointed auditor. In July of the following year he was appointed superintendent.

William Thomas Lewis, station master of the Indianapolis Traction Terminal station and formerly superintendent of the Indianapolis Street Railway, died recently. Mr. Lewis had been connected with the street railways of Indianapolis for 33 years, starting as a driver. At the time of his funeral all city and interurban cars in the city were stopped for three minutes as a mark of respect.

William A. Kreidler, founder and principal owner of the Western Electrician of Chicago, died of apoplexy in Augusta, Ga., on March 26. He was born in South Dansville, N. Y., on August 20, 1858, and attended the University of Rochester. Before graduation he removed to Chicago and entered the employment of the Western Electric Company. In 1887 he established the Western Electrician, and since then has devoted his entire attention to the direction of that paper. He also was one of the organizers of the old Chicago Electric Club and was its secretary for several years. He was a member of the American Institute of Electrical Engineers, the National Geographic Society and the Chicago Academy of Sciences.

Financial News

Chicago & Milwaukee Electric Railroad.—On petition of the receivers Judge Grosscup of the United States circuit court has granted authority for the issue of $1,000,000 of receivers' certificates. The petition for leave to issue these certificates, drawn by Howard M. Carter, counsel for the receivers, states that it is desired to create a through line from a point in Milwaukee to a point in Chicago. If the construction of the Milwaukee end of this line can be completed the Chicago & Milwaukee road will connect with the Northwestern Elevated Railroad at Evanston, so that by transfer at that point passengers can make the through trip with but one change from Milwaukee to Chicago. Bion J. Arnold checked the estimates for the expense of completion of the road, which it is expected will be $896,150. Among the expenses are the following: Grading right of way, $97,500; rails and tracklaying, including work in Milwaukee and on viaduct in Milwaukee, $84,650; trestle work, culverts and crossings, $12,400; ballasting, $17,300; interlocking plant, $15,100; overhead construction, $68,650; passenger platforms and shelters, $7,000; 10 passenger coaches complete for service, $122,200; substation near Milwaukee, including equipment and power line, $155,500; real estate in Milwaukee necessary for terminal purposes, $43,500; balance of purchase price of right of way, $45,900. The petition adds that the committee representing the holders of bonds of the Chicago & Milwaukee Electric Railroad of Wisconsin has secured deposits of more than $5,000,000 of the bonds under an agreement which contains specific authority to the committee to consent to the issue of not exceeding $1,000,000 certificates for the completion of the road in Wisconsin. The certificates are to be a first lien upon the property.

Chicago Railways Company.—Stockholders have authorized an increase in the board of directors from seven to nine.

Delaware & Atlantic City Railroad.—Vice-Chancellor Leaming has appointed William S. Casselman of the West Jersey Title & Guaranty Company of Camden, N. J., receiver. The only asset is said to be $104,000 deposited with the secretary of state of New Jersey as a guarantee that the company would construct a railroad between Camden and Atlantic City.

Detroit United Railway.—J. C. Hutchins, the president, has made the following statement regarding the earnings for February and for the two months ended February 29, 1908: "It is proper to state that our decreased net results for the month of February are not due entirely to the prevailing business depression, but in part are due to climatic conditions. The weather encountered in that month was much the most severe we have experienced in several years, resulting in marked interference with the traffic and in largely increased operating expenses."—F. W. Brooks, the general manager, and A. J. Ferguson have been elected directors.

Interborough Rapid Transit Company, New York.—Shareholders have approved the execution of a mortgage to secure the proposed issue of $55,000,000 bonds.

Interstate Railways Company, Philadelphia, Pa.—The report for the fiscal year ended January 31, 1908, shows the following: Income from investments and loans, $514,165; interest on collateral trust bonds, $431,064; expenses and tolls, $20,419; net surplus, $62,682; previous surplus, $106,464; profit and loss surplus on January 31, 1908, $169,146.

New York-Philadelphia Company, Philadelphia.—The following protective committee of bondholders has been formed: A. Merritt Taylor of Philadelphia, chairman; A. B. Farquhar, York, Pa.; E. C. Miller, Clarence L. Harper and Howard M. Van Court of Philadelphia. This committee will co-operate with holders of underlying bonds and with the committee representing holders of the first mortgage bonds of the subsidiary Camden & Trenton Railway. The receiver of the latter road has filed a statement with the United States court, which shows the following: Total assets, $791,701, including with other items: Rights of way and franchises, $425,000; tracks, bridges and overhead equipment, $279,883; rolling stock, $2,650. Total liabilities (exclusive of capital stock), $1,729,646, the principal items being: First mortgage 5 per cent bonds, $710,000; general mortgage 5 per cent bonds, $622,500; bills payable, $231,415, and accrued interest thereon, $21,000; car trust certificates, $39,000; bond interest accrued, $48,296.

Pacific Electric Railway, Los Angeles, Cal.—It is reported in Los Angeles that E. H. Harriman has purchased from H. E. Huntington the control of this company and the Los Angeles Railway, the Los Angeles-Pacific Company, the Los Angeles Inter-Urban Railway and the Los Angeles & Redondo Railway. Mr. Huntington is quoted in New York as having said in relation to the rumor that there has been no change in the balance of interests between himself and Mr. Harriman.

Toledo & Indiana Railway, Toledo, O.—On the application of S. C. Schenck and J. M. Longnecker, president and director, respectively, Judge Brough of the common pleas court appointed C. F. M. Niles receiver for this company at Toledo on March 30. Mr. Niles is president of the Security Savings Bank & Trust Company of Toledo, which is trustee under the deed securing the first mortgage bonds of the railway. The Toledo & Indiana road did not meet the interest due on its bonds on January 1. Messrs. Schenck and Longnecker filed the petition as judgment creditors. The petition declares that the company is wholly insolvent, having defaulted upon interest aggregating more than $60,000. Business depression is said to be largely responsible for the default. The company consented to the appointment of a receiver.

Union Railway, New York.—Frederick W. Whitridge, receiver for the Third Avenue Railroad, was appointed receiver for this company by Judge Lacombe of the United States circuit court on April 1. The entire capital stock of the Union Railway is owned by the Third avenue road. The appointment was made on a petition filed by the Pennsylvania Steel Company, to which there is due by the Union Railway $28,323.

Dividends Declared.

Aurora Elgin & Chicago Railroad, common, quarterly, three-fourths of 1 per cent; preferred, quarterly, 1¼ per cent.

Columbus Newark & Zanesville Electric Railway, Newark, O., preferred, quarterly, 1½ per cent.

Forest City Railway, Cleveland, quarterly, 1½ per cent.

Johnstown (Pa.) Passenger Railway, quarterly, three-fourths of 1 per cent.

Public Service Corporation of New Jersey, Newark, N. J., quarterly, 1 per cent.

Manufactures and Supplies

ROLLING STOCK.

San Francisco Oakland & San Jose Railway, Oakland, Cal., is reported to have 10 interurban cars under construction at its Emeryville shops.

Louisville & Southern Indiana Traction Company, New Albany, Ind., has placed an order with the American Car & Foundry Company for four double-truck cars to be used as trailers.

Forest City Railway, Cleveland, O., is preparing specifications for 100 pay-as-you-enter type cars and is remodeling 50 cars in its own shops, so that the pay-as-you-enter system of fare collection may be used.

Columbus Urbana & Western Electric Railway, Columbus, O., which was reported in the Electric Railway Review for March 28 to be asking prices on one interurban car, has placed the order with the McGuire-Cummings Manufacturing Company.

TRADE NOTES.

T. H. Symington Company, Baltimore, has contracted to equip with Baltimore ball bearing center plates 700 cars of the Philadelphia Rapid Transit Company.

American Locomotive Company has declared the regular quarterly dividends of 1¾ per cent on the preferred stock, payable April 21, and 1¼ per cent on the common stock, payable April 22.

Zelnicker Crayon Works, St. Louis, Mo., reports a large business with its Suremark crayon. This is a cheap crayon designed for general use and to mark on anything, and is carried by leading jobbers and dealers.

P. O. Adams Rail & Safety Appliance Company, Cameron, Tex., has been incorporated with $100,000 capital stock to manufacture safety rail joints, brake appliances and railroad crossings. The incorporators are: P. O. Adams, W. H. Triggs, Dr. J. C. Reese and others.

Thomas Madill, of the railway department of the Sherwin-Williams Company, has just returned to his office in the Railway Exchange, Chicago, after an absence of four months spent in Florida and Cuba. He has entirely recovered from a severe illness, which necessitated the vacation.

Canadian Westinghouse Company, Limited, Hamilton, Ont., at a meeting of shareholders held on March 31 submitted its report for the year ended December 31, 1907. The net profit for the year was $427,053, an increase of 23 per cent over 1906. All of the officers were re-elected.

Electric Storage Battery Company, Philadelphia, at its annual meeting held at Camden, N. J., elected Alexander C. Humphries, Francis E. Bond and D. Windsor as directors to succeed H. P. Whitney, H. H. Vreeland and Thomas Dolan, resigned. The other retiring directors were re-elected.

Westinghouse Machine Company, Pittsburg, Pa., at a recent meeting of stockholders increased the membership of its board of directors from five to nine. Application for the discharge of the receivers has been granted by Judge James S. Young of the United States circuit court, and beginning April 1 the company continued business under the direction of the new board.

American Supply & Machinery Manufacturers' Association, 309 Broadway, New York, advises that at the convention to be held at Richmond, Va., from May 13 to 15, the Hon. William H. Taft will address a joint open meeting of that association, the National Supply & Manufacturer Dealers' Association and the Southern Supply & Manufacturer Dealers' Association on the afternoon of May 13.

J. G. Ellendt Company, engineer, 1 Madison avenue, New York, is sending out a folder descriptive of its Elasto sanitary flooring, which is a composition of cement and is claimed by the company to be admirably adaptable for flooring because of its silent, non-slippery and agreeable contact under foot; also its extreme durability. This company makes a specialty of the design and superintendence of reinforced concrete construction. Reinforcing materials are supplied.

B. E. Sunny has resigned as vice-president and western manager of the General Electric Company, with headquarters in Chicago, and has been elected a vice-president of the American Telephone & Telegraph Company, New York. He will still be connected with the affairs of the General Electric Company, although not actively, for an indefinite period and probably will continue to reside in Chicago. Mr. Sunny is succeeded as manager of the Chicago office by James W. Johnson, who has been assistant manager for several years.

Allis-Chalmers Company, Milwaukee, Wis., has received an order from the Winnebago Traction Company, Oshkosh, Wis., for the car equipments for its new rolling stock, the purchase of which was noted in the Electric Railway Review for March 7. The equipments comprise the Allis-Chalmers type R 50 railway motors with double-end control, and the usual auxiliaries, including circuit-breakers, lightning arresters, trolleys, car lighting and power wiring. The motors are each capable of developing a normal output of 55 horsepower under pressure of 500 volts at the motor terminals.

American Car & Foundry Company's report for the quarter ended January 31, 1908, shows the following:

		Increase.
Net earnings	$ 1,772,201	*$ 536,081
Preferred dividend, 1¾ per cent	525,000	Unchanged
Balance for common	1,247,201	*535,081
Common dividend	300,000	150,000
Surplus	947,201	*685,081
Previous surplus	23,271,251	6,921,120
Total surplus	24,218,452	6,236,039

*Decrease.

ADVERTISING LITERATURE.

(Mention of the Electric Railway Review will assure prompt attention to requests for publications listed here.)

Arthur S. Partridge, 421 Olive Street, St. Louis, Mo.—April offerings in second-hand electric railway material and equipment are attractively shown in an illustrated 6-page leaflet.

Joseph Dixon Crucible Company, Jersey City, N. J.—The April issue of "Graphite" contains the usual amount of interesting matter, including an article entitled "Dixon's Crayons for Railroad Work."

Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 4010 shows the 51 standard wiring symbols for use in all wiring specifications as adopted by the National Electrical Contractors' Association.

Walter A. Zelnicker Supply Company, St. Louis, Mo.—Rail and equipment bargains for April are listed in the usual comprehensive form.—A circular describes the Zelnicker adjustable car door roller.

Standard Varnish Works, 29 Broadway, New York, N. Y.—A new catalogue of 48 pages and cover, entitled "Architectural Finishes and Stains," is addressed especially to architects. All who have to do with railway architecture will find it valuable for reference, as the information shown is accurate and reliable, presented in concise and simplified form.

H. W. Johns-Manville Company, 100 William Street, New York, N. Y.—An illustrated booklet, entitled "Asbestos Wood," sets forth the advantages of this material as a fireproof substitute for wood, slate, marble and fiber in building construction and electrical insulation. The text is quite interesting, particularly to those who have not kept posted on fireproofing progress.

Under-Feed Stoker Company of America, Marquette Building, Chicago, Ill.—A recent bulletin contains much interesting matter pertaining to installations of the Jones stoker. Among the articles is one descriptive of a recent installation in the general office building of the Buffalo Rochester & Pittsburg at Rochester, N. Y. Several appropriate halftone views are used in connection with this article.

Vote-Berger Company, La Crosse, Wis.—A large illustrated folder of unique design demonstrates the advantage of the "D. & T." pole anchor in an interesting manner. The name is derived from the method of installation, the anchor being first driven into the earth with a sledge, then twisted with a crowbar three turns to the right. This sets the anchor solidly in undisturbed earth, the entire operation requiring the work of one man for one minute only without special tools.

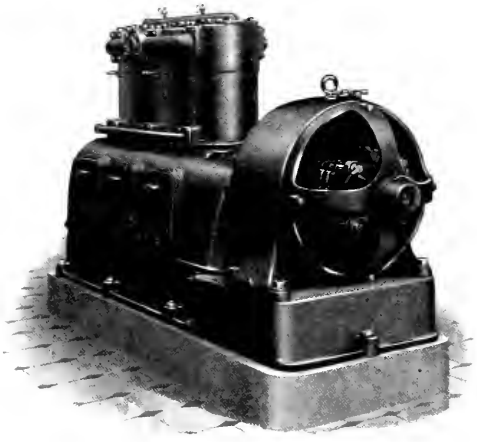
Cleveland Crane & Car Company, Wickliffe, O.—A recently issued catalogue of Cleveland electric traveling cranes is a handsome and comprehensive book of 46 pages and cover, 9½ by 12¼ inches. It has an attractively embossed cover and is bound with heavy black silk cord. The contents include concise descriptions of the details of construction, together with numerous illustrations of unusual excellence. Many of the latter are prints on heavy enameled stock tipped on the pages. Two pages are utilized to show a partial list of customers.

NATIONAL TYPE "3VS" AIR COMPRESSORS.

The extensive adoption of compressed air as a medium for performing various industrial operations has brought with it a demand for air compressing apparatus that is simple and durable in design and construction, efficient and reliable in operation and of as low cost as is consistent with good workmanship and materials.

The necessity for economical production and the almost general adoption of electricity as a motive power and its flexibility of transmission render electrically operated compressors preferable to other types.

In the development and placing upon the market of the National "3VS" type of compressors, the aim was to produce a machine the utility of which would be unlimited and which could be depended upon even under most unfavorable conditions, to operate economically and efficiently, and as far as possible to be free from breakdown with its attendant expensive repairs.



Motor-Driven 3-Cylinder Air Compressor.

The "3VS" compressors have been very carefully designed so as to form most compact, self-contained units, both durable and efficient, and very economical in operation. They are a single-stage type of compressor with three vertical cylinders. Placing the cylinders on the vertical plane enables the machines to be built within smaller dimensions than the horizontal type and also eliminates all strain and wear on the pistons and cylinder surfaces. All working parts are entirely inclosed, affording protection from mechanical injury.

The units are designed for continuous service at 90 pounds pressure, but can be furnished for pressures up to 150 pounds at a slightly reduced capacity rating. Driving power is transmitted from the motor to the compressor by means of a herring-bone gear and pinion. Each compressor unit is provided with trunk pistons, the workmanship of which is carefully executed so that they fit the bore of the cylinders properly. Each piston has a self-adjusting metal packing ring, thus dispensing with the use of stuffing boxes. The sections of the rings are very carefully assembled by hand and the completed rings are carefully ground on special machines. The pistons are operated by connecting rods, which are in turn mounted on and operated by the crankshaft. Water jackets inclose the cylinders and serve to keep their temperature at a minimum.

Motors for operation on direct-current or on alternating-current circuits are furnished with and as a part of these compressors. The direct-current motors are of the company's standard "C. S." type, which is particularly adapted to the peculiar characteristics of air compressor loads. These motors are of the 4-pole type and are heavily compounded, so that in case of necessity they may be started by throwing the full line voltage directly across the armature without damage or injury. For starting service armature starters, which consist of an air governor and an automatic rheostat, are furnished. These starters automatically control the operation of the compressors, keeping the air pressure within predetermined limits. Water governors can be furnished to automatically cut off the circulation of water in the cylinder and cylinder head jackets as soon as the compressors are shut down and in a like manner admit the water when the operation of the machines is resumed. These governors are very simple and reliable in operation.

The "3VS" type of compressor has been developed and is built by the National Brake & Electric Company in capacities of 50, 100, 150 and 225 cubic feet of free air per minute.

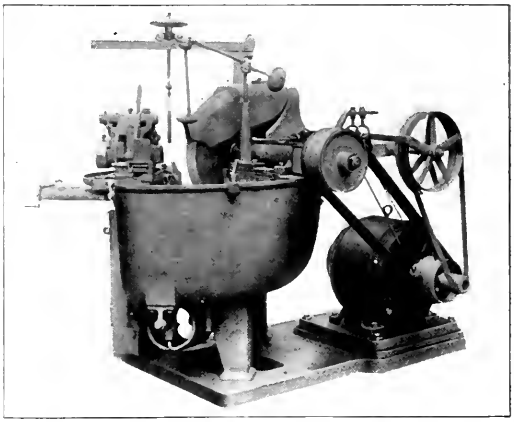
EFFECTIVE TOOL GRINDING.

To efficiently grind steel tools by means of rapid cutting wheels it is absolutely necessary that the contact between the two should be a line and not a surface. Hence, if it is desired to grind a plane face of a tool, the wheel must have a cylindrical or conical surface, past which the surface to be ground must be moved in a plane. A plane face of the wheel cannot be used for this purpose, because it and the surface being ground would soon coincide, with the results of no cutting and much heating.

The tool should be clamped in the holder against its base or the surface upon which it rests when in use in order to avoid any errors due to want of parallelism of its sides and to enable it to be reground with the minimum loss. All of its plane faces should be ground without altering its position in the holder, to insure accuracy of the angles and uniformity in results. This requirement is particularly important in thread tools.

The tool holder should be capable of presenting the tool to the wheel in such manner that any face can be so ground as to have a definite, predetermined relation to the other faces and to the shank, and the adjustments necessary to accomplish thus must be easily understood and quickly manipulated. It must be so mounted as to enable the tool face to be easily and quickly reciprocated past the line of cut of the wheel, and to be reliably fed against it and brought to any part of it. The cuts should be light, quick and frequent to produce the best results in the shortest time.

Experiments have demonstrated that for roughing cuts a curved cutting edge is more efficient than a straight one, and that different materials and different depths of cut require different degrees of curvature; also that the cut should be a draw cut and not a gouging cut, so that the bulk of the metal would be removed ahead of the point of the tool. This adds greatly to its life, the point being the most delicate part.



Universal Tool Grinder Belt Driven by an Allis-Chalmers Motor.

Universal tool grinding machines, manufactured by William Sellers & Co. of Philadelphia, Pa., such as the one illustrated herewith, which is belted to an Allis-Chalmers type "K" motor, have been designed to meet the above requirements. Heat generated by the grinding is carried off by means of a large volume of water at low velocity, which is forced to the tool by a rotary pump through a system of jointed pipes, ending in an adjustable nozzle. The use of such a large quantity of water demands that all working parts should be protected from it on account of the grit carried along with it. This has been effectually done. In fact, every point about these machines has been carefully studied and thoroughly tried.

CLASSIFIED ADVERTISEMENTS

Undisplayed advertisements are inserted under this heading at the uniform rate of one cent a word; minimum charge twenty-five cents. Replies directed to this office will be forwarded when required to any address in the United States, Canada or Mexico without extra charge. Advertisements received at the Chicago office by 9 a. m. Thursday will appear in the issue for the same week.

POSITIONS WANTED.

Expert street car electrician, city or interurban lines, desires a change. Fifteen years' experience; capable handling men; also railway park manager. Now with a large railway. Address "No. 578," care of Electric Railway Review, Chicago.

Management of street railway amusement park wanted; experienced, up-to-date, sober and reliable. Park playing vaudeville and bands preferred. Experienced in park designing and construction. Best of references. Don't put it off, write me today. Address E. E. Wilmarth, Massillon, Ia.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married; A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

Master mechanic of undeniable ability and experience is at liberty to accept reasonable offer. Has had 15 years' experience in both steam and electric service. Has exceptional ability in equipping new rolling stock and handling shops and men on economical basis. Address "No. 560," care of Electric Railway Review, Chicago.

Transportation man of seventeen years' experience, young, reliable and thoroughly familiar with organization, dispatching and timetable work, desires a position as superintendent or one of equal responsibility. Highest references regarding character, ability and past service. Address replies to "No. 577," care Electric Railway Review, Chicago.

Position as superintendent or assistant to general manager wanted. Eighteen years' experience in railway work. For the last six years have been superintendent of an electric railway company. Can get best of references from present employers. Can also give good reason for wishing to make change. Address "No. 572," care of Electric Railway Review, Chicago.

Detective, thoroughly experienced all-round inside man, open for engagement. Best of references. Address "No. 574," care of Electric Railway Review, Chicago.

Positon as chief engineer and machinist wanted. Will go to responsible company on trial. Have had 25 years' practical experience. Address "No. 563," care of Electric Railway Review, Chicago.

Wanted—A young man experienced in street railway and electric light accounting desires position as auditor. Best of references as to character and ability. Address "No. 572," care of Electric Railway Review, Chicago.

Position as chief clerk or auditor by young single man with seven years' experience electric railway work. Good knowledge of operating departments; exceptional references. Address "No. 559," care of Electric Railway Review, Chicago.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 568," care of Electric Railway Review, Chicago.

An experienced supply salesman, who also has had thirteen years' operating experience on city lines, desires to form connection with a railway supply house handling either electric or steam supplies or both. Would consider proposition to open sales agency. Address "No. 566," care of Electric Railway Review, Chicago.

Young man familiar with overhead construction of all kinds (including catenary), installation of transformers, lighting, telephones and substation work; also some experience on car and switchboard work, desires position with city or interurban road. Employed but desires change. Best of references. Address "No. 576," care of Electric Railway Review, Chicago.

POSITIONS WANTED.

Position wanted as auditor and accountant. Sixteen years of steam, electric and general experience; good working knowledge of details of general contracting business; clever buyer; possess ability to organize. Can furnish first-class referenec as to character and ability and work accomplished in past; leaving present work because closed; at liberty to accept position any time. Address "No. 575," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Park superintendent wanted. State experience and salary wanted; also give references. Address "No. 561," care of Electric Railway Review, Chicago.

Salesmen with technical knowledge, machinery and electrical installation, also auditors and accountants. Salaries $1,200 to $6,000. Ambitious men write us, JAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

A thoroughly competent superintendent wanted to take charge of 163 miles of electric railway track and overhead work. Must be fully conversant with latest developments in track and overhead work. Send full particulars regarding experience, age and salary required. B. C. Electric Railway Co., Ltd., Vancouver.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Recharging Dry Batteries, the only book ever published giving complete directions of how to prepare chemicals for renewing dry batteries. If you are not more than pleased with this book your dime back. Large electrical catalogue and book postpaid, 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of July 20, 1904, and June, 1906. State condition and price. Address "No. 567," care of Electric Railway Review, Chicago.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts expunged from, and the parts added to, the interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

Electric Railway Review

Subscription: Domestic . . . $2
Foreign . . . $5
Canada . . . $3.50

The location of a repair shop largely dictates the arrangement of tracks that can be used to serve the shop. The track layouts of nearly all of the larger shops recently built confirm the idea that it is an especially good plan to have as many tracks as possible extend through a shop from end to end. In this issue is described a new shop recently equipped for the York Railways Company in Pennsylvania. The general arrangement of this shop probably is as simple as could be desired and combined with this simplicity the builders have wisely extended all of the tracks through the entire length of the shop building and out at the rear, where they join a loop track extending around the shop yards. The possibilities for blocking the shop tracks are thus reduced to a minimum.

Through Shop Tracks.

At two recent hearings regarding fare increases on the cross country electric lines serving Natick, Ashland and the Taunton-Pawtucket territory in Massachusetts before the railroad commission, very little opposition has developed when the earnings and expenses of the companies have been appreciated by the public. At a hearing on the Natick increase from five to six cents on March 31 only one objector appeared, and at a hearing held on April 1 the opposition almost entirely disappeared when the deficit of the Taunton & Pawtucket Street Railway was exhibited. At the latter hearing a large opposition was expected on account of the increase in fare from Taunton to Attleboro. Testimony showed that the company was giving a low rate between Attleboro and Pawtucket because of the existence of a competing line, while charging a high rate between Attleboro and Taunton in the absence of competition, and it was also maintained that the increase was contrary to the franchise agreement. When W. P. Hall, chairman of the commission, read from the company's returns, showing that a deficit of $3,000 a year ago was increased to $8,000 by the operations of the last year, City Solicitor Hathaway stated that this was a sufficient answer to the question whether the fares ought to be raised. The commission will consider the matter, but intimated that some increased revenue in all probability would have to be allowed.

Little Opposition to Massachusetts Fare Increases.

The threatened destruction by fire of the Sullivan square terminal in Boston last week emphasizes again the value of preventive measures in all kinds of electric railway property. It ought to be needless at this time to review in detail the precautions which experience has shown to be wise under the varying conditions of service which characterize power plants, car houses, shops and stations. To a large degree the protection of each piece of property is a special problem. The money loss at Boston was so slight and the element of personal damage so entirely absent that there would be no object in this reference if it were not for the fact that in many parts of the country electric roads are far less careful to anticipate the occurrence of a fire and the conditions are such as to simply invite disaster. We do not propose at this time to reprint the numerous precautions which have been laid down from time to time by expert fire protection engineers for the special guidance of electric railway men, but in congratulating the Boston Elevated upon its good fortune we take the opportunity to urge the most careful study of the fire hazard by all roads that have not paid any special attention to the subject within the last few months.

Electric Railway Fire Hazards.

Handling and adjusting claims is mysterious work. We see the claim agent go here and there apparently fulfilling his allotted duties, and not until a release can be exhibited is there any certainty that his work will result for the best. The qualities which it is desirable that a claim agent should possess have been defined before, but his methods of work are seldom published. One who has been benefited by training in the school of experience may place before the young man in claim work certain precepts which, if followed, will assist him greatly in his chosen field. Frederick W. Johnson, assistant general claim agent of the Philadelphia Rapid Transit Company, is so qualified. Beginning with this issue he presents in the Electric Railway Review the first instalment of a series of four articles addressed to the young man in claim work. To those electric railway employes aspiring to advancement, no matter whether it be in the claim department or elsewhere in the organization, we heartily recommend a careful reading of these "Short Talks with the Claim Investigator." The arguments follow lines somewhat different from any that heretofore have appeared in connection with claim work and departmental harmony in general. They touch on phases which should prove of vital interest to any young man who is ambitious to make a success in his branch of electric railroading. Lastly, probably the most important factor is, that these talks are the result of several years' careful thought upon the subject by their author

Talks with the Claim Investigator.

In connection with the announcement of the New York City Railway of its intention to install automatic fare collectors on its new pay-as-you-enter cars as soon as the public has become reasonably familiar with the principal innovation—the cars themselves—some remarkable figures have been given out by officers of the company regarding the practice of "knocking down" fares. In 1904, it is stated, 3,017 conductors were discharged for alleged failure to account for fares; in 1905 2,448; in 1906 3,924; and in not quite the entire year 1907 5,584. The average number of conductors in the employ of the company is 3,000. The figures for 1907 indicate, therefore, that nearly twice as many men were discharged for this reason as the total number required for the service. By way of exposing a more serious feature of the situation the additional information was given that a large number of men who, the company believes, are not turning in all fares are retained because of the uncertainty of obtaining others in their places who would do any better. It is not claimed that all of this leakage in receipts is due to dishonesty on the part of conductors; yet

Collecting All the Nickels.

it is impossible to determine how much is due to other causes. As a matter of fact, the question is one which larger cars with good facilities for entrance and exit and operated under a headway established under a knowledge of the fairly regular fluctuations of traffic, should remedy. This is already apparent from observation of the new large cars on Madison avenue. It is fair to presume that the results in receipts reaching the company will increase in a ratio commensurate with the improvement in equipment and service. With adequate facilities for the seating of passengers the automatic fare collector will undoubtedly go far toward securing the nickels and making the service even at its present rate of remuneration attractive to the right class of men. That the importance to the company of establishing such a condition of affairs is great is indicated by the estimate that the loss amounts to 10 per cent on gross earnings, or $2,000,000 a year.

JOINT RATES WITH STEAM ROADS.

The conviction has been general with officials of electric railways that in any case involving both a steam and an electric road the interstate commerce commission would decide in favor of the steam line. This impression was strengthened by the decision of the commission denying the petition filed by the Chicago & Milwaukee Electric Railroad for joint rates and through routes with the Illinois Central Railroad.

The commission now, however, has rendered a decision which gives approval to the petition of the Cedar Rapids & Iowa City Railway & Light Company for a joint traffic arrangement with the Chicago & Northwestern Railway, a steam road. Under the decision of the commission the latter railway is directed to establish joint rates with the Cedar Rapids & Iowa City line on or before April 25 and to maintain them for at least two years.

The decision of the commission, rendered by Commissioner Harlan, is not inconsistent with its position as outlined in the case concerning the Chicago & Milwaukee Electric road. The circumstances governing the two cases are different. The Chicago & Milwaukee Electric road parallels steam lines which testified that the service they afforded to shippers of cabbages was adequate. The commission accepted the evidence of the steam railways upon this point and concluded that congress did not intend "to aid carriers to acquire strategic advantages in their contests with one another." Counsel for the electric road in that case contended that the intent of the law was that the commission might prescribe through routes and joint rates provided that no reasonable and satisfactory through route existed for the carrier which complained, but the commission held that the law intended to refer to a reasonable and satisfactory through route for the neighborhood in which the carrier was located.

The Cedar Rapids & Iowa City road went into the suit with the distinct advantage that it served a territory which was not reached by any other existing roads, steam or electric. It owns a right of way between the two cities the names of which are included in its title. The two cities are 27 miles apart. The defendant steam company admitted that the roadbed of the electric line conformed to the standard usual with the smaller steam railways in that section of the country, and that the bridges and culverts were constructed on plans practically identical with those used by the steam railway in similar structures on its line.

The commission concluded that the position of the Cedar Rapids & Iowa City road, serving several communities which desired the benefits of through routes and joint rates and had no other transportation facilities to depend upon, was very different from that of the Chicago & Milwaukee Electric road, which desired to secure joint arrangements for the benefit of several shippers who had only small loading platforms.

In parts of the country where the electric railway mileage is extensive and connections between different companies using the same motive power can be arranged easily it will be desirable to negotiate for such interchange of business as can be demonstrated will be profitable, rather than to attempt to force recognition by steam railways, which are usually parallel lines or connections of parallel steam lines. Where electric lines, however, are in need of joint arrangements which can be secured only through connecting steam railways the decision opens a way of which they should not fail to take advantage.

AN ALL-DAY RIDE FOR FIVE CENTS.

"I can neither pay wages nor buy supplies with transfer tickets. They are of no use whatever to the Third Avenue Railroad," ironically wrote F. W. Whitridge, the receiver, in his petition to Judge Lacombe of the United States circuit court, New York, for permission to discontinue transfers with the New York City Railway.

Mr. Whitridge sent with his petition a letter he had received from a friend whom he had asked to see how far and how long he could ride for a single fare. The friend started on a Third avenue car at Sixty-sixth street and Third avenue at 10:35 a. m. The condition which he describes is a severe indictment of the transfer system which has prevailed in New York. This man rode until nearly midnight on two fares and when he stopped he still had a transfer good for transportation. During the day and evening he purchased theater tickets, chatted with friends, did some shopping, attended to other business, bought lunch and dinner and went to the theater.

The letter to Mr. Whitridge concludes with the statement "that it is entirely possible to ride east and west on one line all day long for a single fare"; that "by getting a southbound transfer one can ride east, west and south practically without limit"; and that "by paying another fare and getting a northbound transfer and using that in conjunction with the southbound transfer one can go north and south, east and west all over town all day long without paying any further fare, and when he gets through still have the transfers to give to a friend to continue the operation."

The transfer system is designed to give a passenger an opportunity to change, without the payment of a second fare, to a cross or diverging line or extension. The use of transfers for other purposes should be prohibited except in case of accident, when it is fair to permit passengers to ride on parallel lines. If passengers can travel in a circle by the use of transfers the system is faulty and no time should be lost in correcting it. The extent to which the system had developed in New York is shown by the following figures relating to the New York City Railway lines:

Year ended Sept. 30.	Revenue passengers.	Transfer passengers.	Percentage of transfer to revenue passengers.	Average fare, cents.
1888.....	193,935,484	1,996,871	1.10	4.94
1890.....	215,235,832	2,578,701	1.12	4.94
1895.....	252,496,016	12,769,810	5.06	4.76
1900.....	360,002,672	173,089,442	48.08	3.38
1905.....	374,258,395	168,957,760	45.14	3.44
1906.....	391,354,877	178,639,866	45.65	3.45
1907.....	376,629,571	194,765,342	51.71	3.29
*1907.....	189,205,244	104,304,715	55.13	3.16

*Six months ended December 31.

In four of the years from the fiscal year 1888 to 1907, inclusive, the total revenue passenger traffic decreased as compared with the previous year, and in two years the transfer traffic decreased. The rapid loss in the average rate of fare is an indication of a situation which might eventually have placed the surface systems of New York in receivership if other causes had not brought them to that end.

The disclosures have led J. F. Calderwood, vice-president and general manager of the Brooklyn Rapid Transit Com-

pany, to publish statistics showing a similar unjust condition of affairs on the lines of that company. In his interview, republished in another part of this issue, Mr. Calderwood states that transfers have increased in an alarming degree in the various cities of the country, especially in the larger places, and more especially in greater New York.

The extension of transfer systems is a subtle and dangerous invitation to lower average fares. No extensions of transfer privileges should be made without the same analytical study that would be given to the question of fares. The public unthinkingly accepts transfers without much thought as to the expense which they impose upon the railways. The New York Times states that "the conviction is forcing itself upon the minds of unprejudiced students of the situation that if the people of Manhattan require and demand a satisfactory street surface railway service they must either consent to a lightening of the taxes now imposed upon the roads or be content to accept a transfer system within much narrower limits." The unfortunate feature of the situation is that it should have required the receivership of the New York surface lines to bring to light a situation which had become dangerous. The court can remedy the situation, as it has in this instance, but it should have been in the power of the officials of the roads, and they should have used their power to prevent the development of the system to the full growth which it reached.

ANNUAL REPORTS.

International Traction System, Buffalo.

Passenger earnings of the International Traction System of Buffalo in 1907 increased $413,585 over 1906, but freight earnings showed a decrease. The detailed earnings and the expenses as reported follow:

Earnings—	1907.	1906.	Increase.
Passenger	$5,272,111.64	$4,858,526.80	$413,584.84
Freight	103,755.56	110,157.14	*6,401.58
Mail	1,938.11	1,799.06	139.05
Express	2,606.29	2,143.39	462.90
Advertising privilege..	35,166.66	24,064.17	11,102.49
Income from securities owned	600.00	600.00	.....
Miscellaneous	28,892.01	27,008.18	1,883.83
Gross earnings	$5,445,070.27	$5,024,298.74	$420,771.53
Expenses—			
Operating expenses	$3,099,439.36	$2,656,661.66	$442,777.70
Depreciation	269,021.82	234,791.88	34,229.94
Taxes	284,140.74	254,819.55	29,321.19
Total expenses	$3,652,601.92	$3,146,273.09	$506,328.83
Total income	$1,792,468.35	$1,878,025.65	*$85,557.30
Fixed charges	1,480,207.78	1,413,171.76	67,036.02
Net income	$ 312,260.57	$ 464,853.89	*$152,593.32

*Decrease.

In his statement to stockholders Henry J. Pierce, the president, states:

Notwithstanding the financial panic which so seriously affected general business during the last quarter of the year, the gross earnings of the system for 1907 increased $420,771.53 over 1906. The surplus was less than for the previous year, on account of higher operating expenses, taxes and interest.

The service afforded to the public was considerably improved over that of the previous year. The car mileage was increased 1,779,790 miles, equivalent to 9 per cent.

During the year $525,327.82 was expended for repaving, relaying tracks with heavy rails, etc., and $865,578.51 for additions to equipment, track and buildings. These expenditures were charged, respectively, to the fund for depreciation and to capital account.

The construction of the Fillmore avenue line of 11.2 miles was completed and the line put in operation, thus increasing the total mileage to 369.58 miles of single track.

A new car house and storage yard, having a capacity of 200 cars, was completed at a cost of $225,000.

Mr. Pierce praises the operation of the 50 pay-as-you-enter cars which were purchased and placed in service in Buffalo on January 5 (Electric Railway Review of January 11, 1908, page 37). The cars, Mr. Pierce says, "have proved a marked success, the municipal authorities, the public and the newspapers joining in praise of the new system of car operation."

The work of the installing the pay-as-you-enter feature upon 150 of the standard cars has been begun, and before the end of this year 200 pay-as-you-enter cars will be in operation in Buffalo out of a total of 600 operated.

COMMUNICATIONS.

MICHIGAN RAILROAD COMMISSION WILL NOT FOLLOW INTERSTATE ACCOUNTING SYSTEM.

To the Editors:

We have given Accounting Series Circular No. 20 of the interstate commerce commission considerable study, but have determined to continue using the blank form of report prepared by a committee of the Street Railway Accountants' Association and adopted by the National Association of Railway Commissioners in 1903.

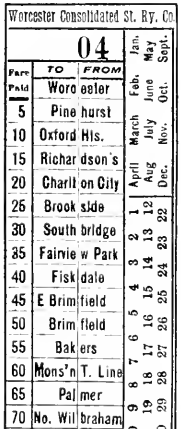
We do not favor any system which is so finely subdivided as to become needlessly oppressive to the companies and to the commissions receiving reports. In Michigan our electric lines, with two exceptions, are small local affairs and we readily recognize the impracticability of asking them to furnish any more minute data than we are already asking. However, we are not posing as critics of any other commission.

MICHIGAN RAILROAD COMMISSION,
By James Scully, Commissioner.

Lansing, Mich., April 9, 1908.

DUPLEX TICKET ON MASSACHUSETTS LINES.

An explanation of the through ticket system which is now used on a number of the through lines of associated Massachusetts railways has been received from C. W. Wood, general freight and passenger agent of the lines, Boston, Mass. The lines are the Worcester Consolidated Street Railway, the Springfield Street Railway, the Berkshire Street Railway, the Milford Attleboro & Woonsocket Street Railway and the Interstate Consolidated Street Railway.



Duplex Ticket.

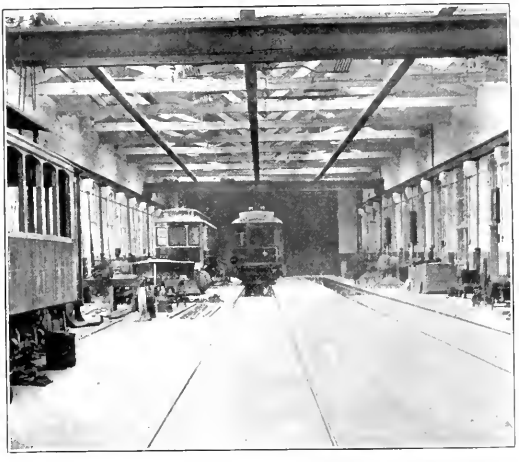
The accompanying illustration shows the duplex ticket used between Worcester and Springfield, Mass. Each conductor is supplied every morning with a sufficient number of the tickets to meet his requirements during the day. A passenger pays a through fare and the conductor punches on the ticket the date, the points of departure and destination and the amount of fare collected. One portion of the duplex ticket is retained by the conductor and given to the auditor with the daily report, while the other portion is held by the passenger but must be surrendered at destination, when that portion is also forwarded to the auditor.

On cars supplied with Ohmer fare registers the conductor registers the total fare as collected. On other cars supplied with separate ticket registers the conductor registers each fare at every zone. Under the old system passengers were required to pay five cents as each fare zone limit was reached, and the advantages and desirability of the new arrangement are obvious. Mr. Wood states that so far the new system has proved satisfactory from the standpoint of the company and that its convenience is appreciated by the traveling public.

NEW REPAIR SHOPS OF THE YORK RAILWAYS COMPANY.

Within the past year the York Railways Company, York, Pa., has erected and fully equipped a repair shop with ample facilities to care for both its city and interurban cars. The general arrangement of the repair shop and its adjacent storage buildings is shown in an accompanying plan. The repair shop building is 265 feet long by 75 feet wide, including one bay 50 feet wide, through which extend three tracks. This bay is subdivided into a paint shop 60 feet long, shut off from a general repair shop by three Kinnear rolling steel doors. A parallel bay 25 feet wide is subdivided into smaller shops, each of which faces the general repair bay. The shop building has concrete floors and foundations, brick walls and a timber truss roof.

York Shops—Special Design of Pit Construction.



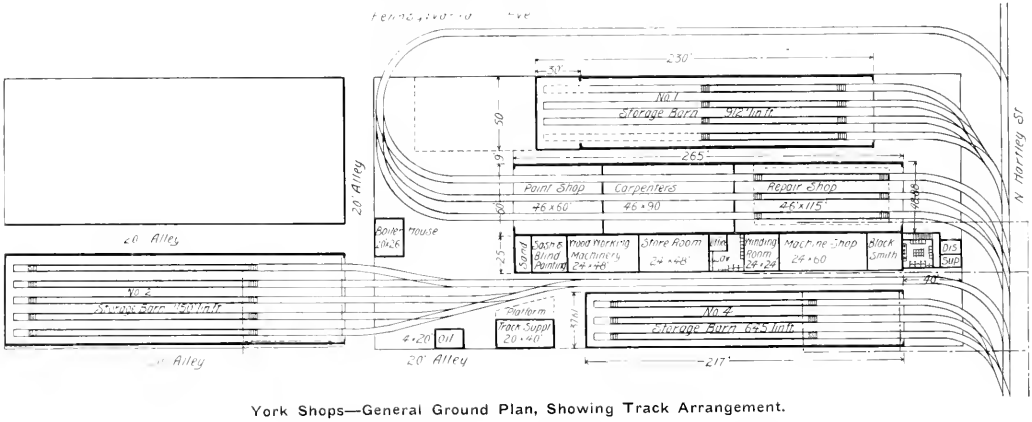
York Shops—Interior of Repair Bay.

General Repair Shop.

The general repair shop, an interior view of which is presented, is served throughout its length by two 6-ton hand-operated Maris Brothers cranes. Each of the tracks extending through this bay has a pit of special design about 75 feet long. Accompanying illustrations show the detail construction of these pits. They are light, roomy and of such design that they may easily be kept clean. The three pits are a part of one general excavation floored over between tracks. The floor construction comprises a reinforced concrete slab spanning parallel cross piers set on 10-foot centers. This slab is 7 inches thick and was designed for a loading of 5,000 pounds per square foot. The 7-inch high T-rails along the edges of the pits are bolted to two 15-pound I-beams buried in the concrete mass of the piers. At the level of the pit floor the distance between piers is 7 feet 3 inches, thus allowing ample room for working and handling large material below the repair shop floor.

Along the bottom of the pits extends a standard-gauge track comprised of T-rails buried in concrete. As there is ample space under the repair shop floor for storing motors, wheels, trucks, etc., this track becomes useful in handling such material. Concrete steps at each end of each pit lead to the general floor level. The pits are wired in conduit, which is provided at 10-foot intervals with Crouse-Hinds "Condulet" terminal outlet sockets with incandescent lamps. At equal intervals are similar outlets for portable extension lights.

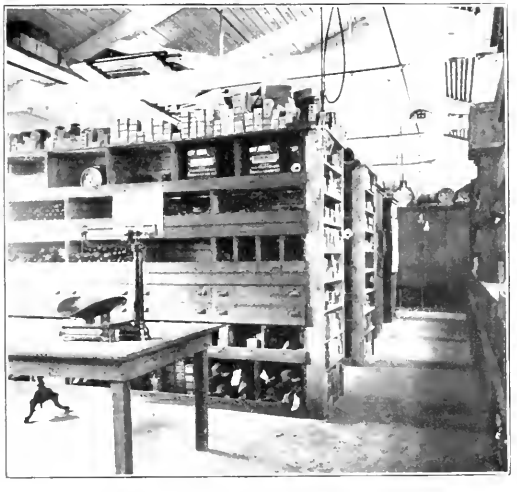
At the end of each pit near the center of the building is a hydraulic hoist of 4,000 pounds lifting capacity installed under a section of the track, which is embedded in the pit



York Shops—General Ground Plan, Showing Track Arrangement.

floor. Reference to an accompanying engraving showing the design of one of these pit hoists will illustrate its simplicity and ruggedness. Essentially the hoist comprises a buried casing with a stuffing box at the top through which moves a section of wrought-iron pipe 10 inches in diameter, serving as a plunger. Either air or water pressure may be used in these hoists. On top of the plunger is a cast-iron table carrying two 3-foot sections of rail mating with the rails of the track in the floor of the pit. In its up-and-down movement the platform of the hoist is guided by brackets which fit over vertical sections of T-rail in the concrete piers supporting the floor above.

The entire shop is piped for compressed air, which is supplied by a 135-foot compressor, built by the Bury Compressor Company and driven by a Westinghouse 25-horsepower type S motor. The building is heated by hot water fed from a 50-horsepower Bigelow boiler and circulated through a closed circuit system of piping by a Worthington 4-inch centrifugal pump. All the light and power wiring is encased in conduit, the circuits being controlled from a single board. There are 22 incandescent arc lamps used for lighting. In handling motors on the repair shop floor there are



York Shops—Stock Racks in Storeroom.

used two O. M. Sargent balanced hoists, which are hung on the lifting hooks of the traveling cranes, thus materially lessening the work of hand operation. A pipe fitter's bench, mounted on substantial wheels, is found to be of especial use because it can be moved to various parts of the shops.

Miscellaneous Shops.

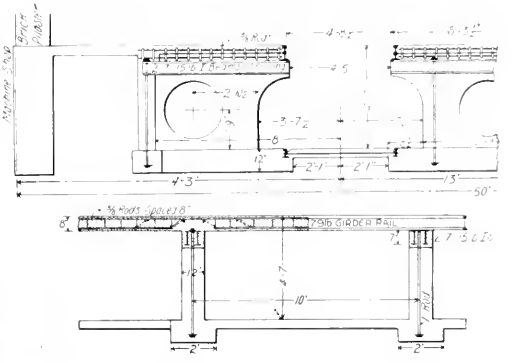
Several departmental shops are arranged in a row opening off the general repair bay. A brick fire wall separates the two sections of the building.

The blacksmith shop, 24 by 24 feet, is at the front end of the building. In this shop are a 44-inch Buffalo down-draft forge with a combination motor-driven blast and exhaust fan set; a home-made forge for melting babbitt; a hand-operated Niagara punch and shear and a specially designed home-made rack for storing iron.

The machine shop, next in order, is 24 by 60 feet, and directly faces that part of the repair shop floor in which the pits are built. All the tools in the machine shop, with one exception, are group driven by a Westinghouse 15-horsepower type S motor supported from the ceiling. The list of tools includes a 200-ton 42-inch wheel press built by the Hydro Press Company, Rochester; Norton wheel grinding machine independently driven by a 35-horsepower motor; Putnam 42-inch wheel borer; American 20-inch by 12-foot lathe with quick-change gearing; American 2½-foot radial drill; American 16-inch back geared shaper; Standard 1½-inch bolt cutter; Yankee drill grinder; Prentice drill press; and a Robinson power hack saw.

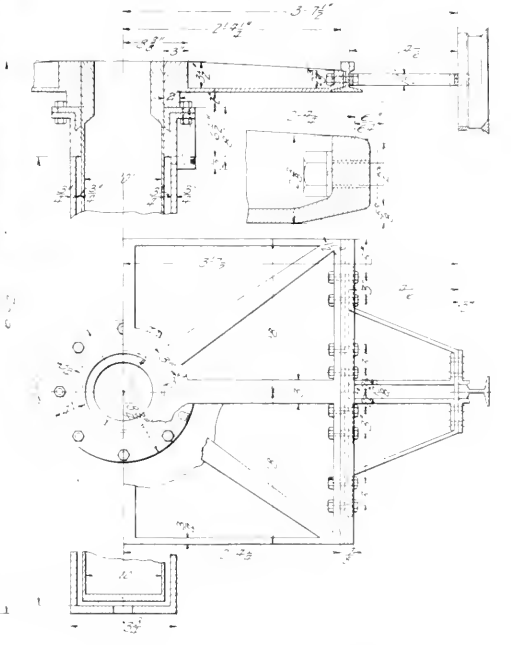
A Coburn overhead track and trolley with a chain hoist serves the various tools in the machine shop.

Adjacent to the machine shop is the armature room, 24



York Shops—Details of Floor and Pit Construction.

feet square. The facilities in this room include a Peerless armature truck; Peerless combination banding and coil winding machine (both built by the Device Improvement Com-



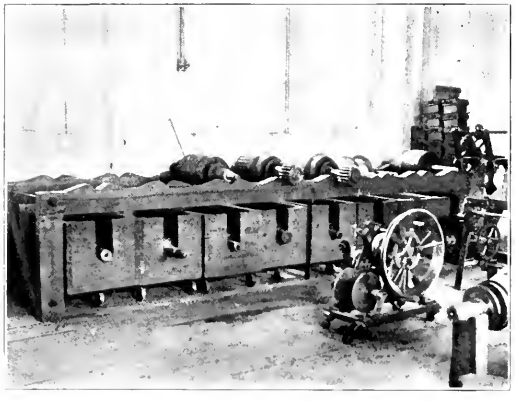
York Shops—Details of Hydraulic Pit Hoist.

pany, Hanover, Pa.); 18-inch Wright lathe, and a continuation of the Coburn overhead track and trolley with its chain hoist. A unique method is used for storing armatures and protecting them from damage. The rack and portable boxes

used for this purpose are so simple that the accompanying illustration serves better than a description.

At the center of the row of smaller shops are the lavatory, which contains expanded metal lockers and self-flushing closets, and a brick inclosed office for the master mechanic. Next in the line of the smaller shops is a storeroom, 24 by 48 feet, of which an illustration is presented herewith.

Adjacent to one end of the storeroom is the wood shop, 48 by 24 feet, which adjoins at its opposite end the varnishing room, 24 feet square. All the machinery in the wood shop is driven from a line shaft operated by a 15-horsepower type S Westinghouse motor. The woodworking machinery, a large part of which was supplied by the H. B. Smith Machine Company, includes the following tools: Eight-inch 4-side molder; 26-inch planer (single surfacer with sectional rolls); 24-inch jointer; 42-inch band saw; tenoner; 2-spindle shaper;



York Shops—Armature Rack and Portable Boxes.

mortiser; wood lathes; swing saw; and tilting table rip and cross cut saw.

At the extreme rear end of the row of smaller shops is a sandhouse, 12 by 24 feet, with an entrance from the outside only. We acknowledge our indebtedness to F. R. Newman, master mechanic, for his assistance in preparing this article.

CURTIS TURBINE SALES.

The following statement of sales of Curtis steam turbines is of especial interest, as showing the rapid development of this type of prime mover.

Orders to December 31, 1907, include: 261 central station and traction power plants with a total capacity of 986,020 kilowatts; of these 71 are less and 190 are greater than 1,000 kilowatts, the average capacity being 3,778 kilowatts. 298 industrial and miscellaneous power plants with a total capacity of 87,675 kilowatts; of these 243 are less and 45 are greater than 1,000 kilowatts, the average capacity being 305 kilowatts.

Installations to December 31, 1907, include 943 machines averaging 857 kilowatts each in capacity, and orders on hand at that date include 153 machines averaging 1,739 kilowatts each in capacity, the total sales being 1,096 machines, aggregating 1,073,695 kilowatts in capacity.

Orders for Curtis turbines taken by the General Electric Company in the fiscal year ending January 31, 1908, were for 325 machines aggregating 286,320 kilowatts in capacity.

The Washington Baltimore & Annapolis Electric Railway, Washington, D. C., on April 2 began operating on its regular schedule over the new line between Washington and Baltimore and the branch to Annapolis. This road was described in the Electric Railway Review of February 15, page 200.

REPLY TO INTERSTATE COMMERCE COMMISSION'S ACCOUNTING CIRCULAR.

BY H. E. WEEKS, SECRETARY AND TREASURER TRI CITY RAILWAY, DAVENPORT, IA.

Circular No. 20 of the interstate commerce commission, dated January 10, 1908, was not received until March 1. The time allotted, 28 days, to consider a matter of such grave importance as the entire change of the accounting system in use by the street and interurban railway companies of the United States was much too brief.

It would seem that before changing the uniform system of accounts, which has been developed after nine years of painstaking labor by those fitted by their intimate acquaintance with the business to work out its special requirements, the commission should study carefully the requirements of the street and interurban railway interests.

The only branch of the industry which can adopt steam road methods is the interurban branch, which has come into prominence in the last five years; and it is probably the desire of the commission to adopt a system of accounts which will be uniform and will enable the steam road when electrified to continue its comparisons that has led to the error of supposing that because the interests were similar in that particular branch the system of accounts as prescribed for steam roads could be modified to meet the needs of urban properties.

It will undoubtedly be possible to so classify the revenues and expenses that the general accounts can be the same, but beyond that point each industry will have to be given the individual consideration which it merits.

Even in the case of interurban properties the method of operation differs so radically on account of the difference between the method of propulsion that the comparison has to be qualified; whereas in urban business the unit of comparison is entirely different.

Judging from an experience covering the operation of street and interurban properties with a gross income of from $30,000 to $90,000, I should say that two classifications are not sufficient. A road should be considered as a small road until the gross earnings are at least $300,000, as any attempt to present any great amount of detail will only result in estimates and inaccuracy, which will render statistics worthless. The primary accounts could be amplified to meet the requirements of the road with a gross income of less than $1,000,000 and further amplified to cover gross receipts of over $1,000,000.

The question of the amount of detail to require is one of grave importance; a few accounts accurately kept are worth far more than a larger number based on estimates, the reliability of which cannot be vouched for.

The courtesy of submitting the proposed classification should be appreciated and every effort possible should be put forth to give as much help as possible along the line of perfecting a classification which will give the public and the industry the information desired. The feeling has prevailed that the commission has not given the suggestions offered by the representatives of the street railway industry of the country the consideration that they merited. The tentative classification upon which much time and labor were spent by the American Street and Interurban Railway Accountants' Association represents the views of the street railway industry as to how the accounts should be kept.

In order to bring out the inapplicability of the steam road classification, as it has been modified for electric railway use, to the needs of the industry, detail criticisms of the accounts will be made.

Account No. 7, "paving," is not definite. It should specify that the first cost of paving, even if the track is only reconstructed when the paving is done, should be charged to "road and equipment," No. 10.

Account No. 10, "bridges, trestles and curverts." Provision should be made for bridges not owned by the operating

companies, as bridges over which urban properties operate are more often owned by municipalities than otherwise.

In account No. 13 the "note" is not definite. No account is provided for other track material.

Account No. 14, "telegraph and telephone lines," inasmuch as the telegraph and telephone lines used by an electric road are carried by the same poles that carry the power transmission and conductor wires, it would be impracticable to charge separate maintenance of crossarms, poles, guy wires, etc., as it would necessitate a large amount of estimating.

Unsatisfactory Departmental Accounting.

Account No. 15, "other maintenance of way expenses." This account necessitates an amount of departmental accounting which on most electric roads will involve so much estimating that the results derived will be unsatisfactory. The same tools may be used by several departments. "Superintendence" could not be detailed with any degree of accuracy. The same can be said of both "printing and stationery" and "injuries to persons." In the case of "printing and stationery" the same typewriters, adding machines and other office appliances are used by all departments.

Account No. 17, "high-tension transmission lines." It will be impossible to separate this expense with any degree of accuracy, as high-tension, low-tension, trolley, telephone and signal wires are often carried on one pole line. The same condition applies to account No. 18, "overhead feeders," and to account No. 21, "overhead trolley lines."

Account No. 34, "electric equipment." Electric equipment is used on service cars, work cars and snow equipment, depending on the season. It would be difficult to determine where to charge maintenance.

Account No. 40, "removal of snow, sand and ice." It would be impossible to determine an accurate charge for current used, for even if meters were placed on cars the conditions under which cars operate are such as to preclude accuracy; furthermore, much current is consumed by small track scrapers on service equipment.

Accounts Nos. 45 and 46. The application of joint facilities accounts to electric roads is not practicable, as they would necessitate so much estimating that the results would be worthless. It would be necessary in many cases to divide a fraction of five cents between accounts Nos. 45 and 46 and between Nos. 104, 105, 115 and 116. The subdivision for charge of current, taking into consideration line loss, would be impossible with present measuring facilities, as they are not to be depended upon. Where freight and express cars of varying weights, depending on the load, are used, the estimate of wear and tear on track would be a mere guess.

Account No. 48, "combination cars—repairs—note A." Electric roads carry express on combination cars or separate cars. Freight and express are often carried in the same cars. Express and mail are nearly always carried in combination cars.

Account No. 50, "mail cars—repairs," is unnecessary in the electric road classification except for very large companies.

Account No. 53, "electric equipment of passenger cars—repairs." The motors used under a passenger car do not remain permanently in passenger service. It would be a guess as to which account should be charged with the repairs, as the motors may be used on any class of equipment. The same criticism applies to accounts Nos. 54, 55, 56, 57 and 58.

Account No. 71, "advertising and attractions." Provision should be made for music parks, park properties and resorts after deducting all income from admission fees, sale of privileges, etc.

Traffic Expenses.

Account No. 72, "traffic supplies and expenses." It would be necessary to estimate the charges to the first heading, "traffic associations." There will probably be an opportunity for electric roads to charge expenses of "industrial and immigration bureaus" several years hence, but it would seem unnecessary to provide for the contingency at present. Regarding "stationery and printing," see remarks concerning account No. 15.

Accounts Nos. 73, 74, 75, 76 and 77. It seems ill-advised to make the heading of an account any longer than necessary. The headings used by the Accountants' association are far better.

Accounts Nos. 79, 80 and 81. A great amount of labor and expense would be required to keep these accounts as they are outlined. It does not seem that the results would be commensurate. If a great number of meters were not installed the results would be unsatisfactory. If the meters were installed the expense would be an unwarranted one.

Accounts Nos. 82, 83, 84, 85, 86 and 87. The street and interurban railway tentative classification accounts from Nos. 19 to 22, inclusive, should be substituted. Express motormen and other employes are provided for in account No. 98.

Account No. 95, "car supplies and expenses," should be rewritten to apply to electric practice; much more detail is used than will be necessary for years. It is altogether impracticable to segregate the cost of lighting cars when cars are lighted and heated by the same current.

Account No. 102, "damage to property." Provision should be made for collision with vehicles in streets, an expense which constitutes a very large proportion of the cost of damages to property by electric roads.

Account No. 106. Why is not the freight claim agent charged to the account affected?

Clearing account "work equipment operation." It is not possible to charge electric current used by work equipment, as no accurate computation can be made.

Clearing account "insurance." Should the total amount charged be divided at an average rate?

Clearing account "injuries to persons." The number of roads that employ an attorney to look after what claims are not adjusted by the officials is so large that the results obtained by trying to distribute the expense over so many accounts would be worthless. Even with roads that employ claim agents an attempt to detail their work would be impracticable.

Criticism of Expenditures for Road and Equipment Accounts.

Account No. 9, "frogs, switches and special work." When a guard rail on a curve is part of a piece of special work is it proper to charge it to this account or should an estimated amount be charged to No. 8? Provision should be made for special work peculiar to the electric railway business.

Account No. 10, "paving." Some provision should be made for paving track already in use.

Account No. 22, "track bonding." Where rails are drilled when purchased, as they usually are, should a portion of their cost be charged to this account?

Accounts Nos. 43, 44, 45, 46, 47 and 48. It would be difficult to make these accounts show correctly, as it would be necessary to make an entry each time a motor was changed from one class of equipment to another, which happens very often on most roads.

Account No. 60, "injuries to persons." Where should damage to property be charged? On an electric road in street construction this is an important item.

Account No. 61, "interest and commissions—note." How should such discounts be treated?

Chicago Lake Shore & South Bend Railway.

Officials of the Chicago Lake Shore & South Bend Railway have announced that the line from South Bend to Michigan City and Kensington, Ill., will be in operation by July 1. At Kensington the road connects with the Illinois Central Railroad for Chicago. Only 11 miles of construction and a bridge remain to be completed.

REPLY TO INTERSTATE COMMERCE COMMISSION'S ACCOUNTING CIRCULAR.

BY R. N. WALLIS, TREASURER FITCHBURG & LEOMINSTER STREET RAILWAY, FITCHBURG, MASS.

Your circular No. 20 has been received and given careful consideration, and we inclose herewith a copy with answers to the specific questions, and such marginal comments as a study, necessarily hurried by the shortness of time, has disclosed.

You invite any "criticisms and suggestions pointing to the improvement of the classification." Frankly, I do not regard the classification of operating expenses as adaptable to the street railway industry. The accounting of any business must follow along natural lines which the customs and usage of the industry have built up, and this classification so far as street railways are concerned does not follow natural lines. It is evidently the work of some one who is unfamiliar with the industry. There are many instances of this in the classification which might be cited, but we will mention but one, which is typical, the motive power of an electric railway. The electric equipment is interchangeable between cars of various types and uses, and electric equipment may be used in December, January and February on snow plows, in March and April on a work car, from April during the summer on a revenue open car, and before the completion of the year on a revenue closed car. To attempt to divide its maintenance among a variety of accounts is unnatural. It would be impossible to tell what part of the wear and tear was due to any one of its uses. Maintenance of electric equipment, therefore, should stand as one account, and not be divided as it is in this classification.

A fundamental error in the classification is the unnatural conformity to steam railroad practice, greatly forced at some points. The two businesses are dissimilar, a fact which it seems difficult to impress upon any one who has not come in contact with both industries or had a chance to study the practices of one with relation to their adaptability to the other. In my opinion reasonable conformity can be attained without radically upsetting natural electric railway practice.

Another error so far as roads under $500,000 or even more annual income are concerned is the great detail of accounts. It must be remembered that there is a limit in percentage of income beyond which the expense of accounting cannot be forced. Beyond that point guesswork and estimate are availed of. This classification on any road under the above income will certainly mean largely guesswork as to many of the minutely divided accounts with resultant inaccuracy. And it must be remembered that railways under $500,000 constitute fully 80 per cent of the operating companies. From the viewpoint of the small company, which cannot afford to do its accounting by departments, the 116 accounts of this classification should be consolidated to not to exceed 30 or 40 accounts.

Our company has been a successful company for 20 years. Its directors and officers have been always exacting in the matter of its statistics, demanding to know from careful accounting what the company was doing financially, and yet the number of all our accounts (of income, expense, capital and special accounts) is at present 65. If this is sufficient for the exacting needs of those who are directing its affairs, it seems to me fully sufficient for the legitimate purposes of the public. I do not agree with those who believe that the larger the detail in accounting the greater the information obtained. As a matter of fact, beyond a certain number of accounts reasonably necessary, additional detail only leads to misinformation.

In my opinion, with anything like a reasonable expenditure for accounting, no road with annual gross receipts of under $500,000 could divide its expenses in any such extent of detail with anything like accuracy. The result would be guesswork and estimate, which defeat the purpose of publicity. While some accounts as they stand are important, in many cases the division is so minute as to be unnecessary. Such, for instance, are the accounts under "A maintenance of way," Nos. 1 to 15, which could be reduced to two accounts in roads of our size, and still not run into large figures.

Another fundamental error occurs in the subdivision of many relatively unimportant general expenses (such as insurance, stationery and supplies, stable expenses, etc.) among a number of accounts, while other general expenses are not so subdivided. This is inconsistent. These items individually or in the aggregate are very small, and their further subdivision on a road of this size brings them to a ridiculous proportion at a very considerable expense of time and labor. "Stationery and supplies" on this road (gross earnings, $280,000) would not total $500, and the labor of dividing each charge among several accounts would be out of all proportion.

Another feature which makes it apparent that some one unacquainted with the needs of the business is responsible for this classification is the fact that many things important in the street railway business have no place at all in the classification. For instance, practically nothing is said about streets, which constitute the entire roadway of a great quantity of companies. Also no mention is made of parks, which are so commonly adjuncts to electric railways.

It seems to us hardly short of ridiculous to include in the classification such lists as stationery, etc., which appear on pages 20 and 21 and other pages, while no list appears in anything like detail of supplies typical to the art (as for instance line materials, electrical supplies, etc.).

I firmly believe that if this classification goes into effect practically as it stands, the needs of the business will require its change within a short time, destroying again year by year comparisons which will already have been destroyed once by this classification. It seems to me it would be better to forestall this by calling in some person or persons thoroughly familiar with the business, whether now connected with it or not, to make up a classification along lines which are adapted to the needs of the business. Such person or persons need not be those employed by corporations at interest, but by being employed by the commission might come under its direct control while doing the work.

Comparative Lamp Tests.

Bulletin No. 19 of the University of Illinois, recently issued, is a report of comparative tests of carbon, metallized carbon and tantalum filament lamps, compiled by T. H. Amrine of the university's engineering experiment station. The report is contained in a 44-page pamphlet illustrated with 32 figures and five tables. From the study of these lamps it appears that the carbon filament and the tantalum filament lamps can cover adequately all the phases of incandescent lighting that are now covered by the three types. For low power costs and for rough or unusual uses and for small candlepower units the carbon lamp was found to be best and often the only one that can be used. For higher costs of power upon poorly regulated circuits and for lightening the load upon overloaded stations, the tantalum lamp was found to be best. It is not recommended by its manufacturers for use upon alternating current, yet the results obtained show that although it does not do so well upon alternating-current as it does upon direct-current circuits, it still gives better economy for the higher power costs than the carbon lamp. The principal fault of the metallized lamp was found to be that of mechanical weakness. In the larger sizes, however, where a heavier filament is used, this fault probably does not exist; so that for units of from 40 to 60 candlepower or above this type of lamp would be very satisfactory. The results of tests from the tungsten lamps are not included in the report because at the time they were started these lamps could not be purchased on the market.

CAR BUILDING WORK OF THE LOS ANGELES & REDONDO RAILWAY.

BY W. F. GOBLE, GENERAL FOREMAN.

The Los Angeles & Redondo Railway Company has, within recent months, built and rebuilt a comparatively large number of rolling stock equipments. An enumeration of the general features of this work may be of interest. The statement which follows includes many of the specialties used in our car construction work.

Los Angeles & Redondo Car Building—Passenger Car with Open and Closed Sections.

Passenger Cars.

One combination open and closed passenger car 47 feet 6 inches long by 8 feet 2 inches wide has been built. The closed portion of this car is 25 feet long and is fitted with eighteen 34-inch crimson plush Hale & Kilburn seats. The open portion has eight Wheeler wood slat seats. Both open and closed sections are provided with "oakette" curtains with Keeler fixtures. The ceilings are sheathed with No. 18 black iron, painted a dark royal green, which, in contrast with the woodwork, stained cherry, gives a very cheerful appearance to the inside of the car. The woods used for the inside finish of the car are white cedar, ash and poplar, with cherry sashes and doors. All windows are glazed with $\frac{3}{16}$-inch plate glass and the transoms with 16-ounce sanded plate.

The electrical equipment comprises four Westinghouse 38-B motors, with a gear ratio of 24-58, mounted on M. C. B. type trucks with equalizer bars and swinging beam bolsters built of 6-inch channel iron capped with $\frac{5}{8}$ by 7 inch plates. The motors are provided with K-14 controllers and the brake equipment comprises the Westinghouse S M E schedule with D-1 compressor. The car is equipped with adjustable illuminated transparent signs for announcing the various routes over which it may be operated.

A combination express and freight car has been built on the same general lines as the straight passenger car just described. The combination car has a 15-foot express compartment. The running gear and the electrical equipment are the same as for the straight passenger car, both cars having the lighting circuits wired in series-multiple with the headlight. Twenty-four 16-candlepower incandescent lamps are used and a No. 14 Mosher headlight. When the headlight is not required a 3-way switch serves to place the interior car lighting circuits in series with the resistance coil.

On account of the sagging of the platforms ten 14-foot combination open and closed passenger cars were rebuilt. In reconstructing these cars the wooden bolsters were removed and by rounding the edges of 4 by 6 inch Oregon pine center sills a reinforcement was made with 6-inch 12¼-pound I-beams 18 feet long, placed adjacent to each center sill on both ends. Four such I-beams were used to each car. The unfilled sides of the I-beams were filled with 2 by 6 inch timbers securely bolted. This construction makes a cheap and very substantial reinforcement. The bolsters for these cars were built of 1 by 8 inch iron trussed with ½-inch iron plate and filled with Oregon pine. The cars were repainted and varnished similar to the passenger car earlied described.

Illustrations of both passenger and combination types of cars are presented.

Freight Cars.

Twenty 40-foot flat cars of 80,000-pound capacity have been built for freight service. These cars were constructed of clear yellow Oregon pine for side, intermediate and end sills. The side sills are 5 by 12 inches; intermediate sills, 4 by 9 inches; end sills, 10 by 10 inches. The sills are trussed with six 1¼-inch iron rods with 1⅜-inch turnbuckles. The queen posts, 14 inches long, are of cast iron. The cars were built to handle lumber and therefore have detachable brake staffs. These staffs are made in two pieces and coupled with a square socket just above the ratchet wheel. The bodies are fitted with Simplex body bolsters and provided with Miner draft rigging and Tower couplers.

The cars are mounted on M. C. B. standard freight trucks, with Simplex bolsters and McCord journal boxes, metal brake-beams and malleable shoe heads, using standard shoes. The wheels are fitted to 6½-inch axles with 5 by 9 inch journals.

Los Angeles & Redondo Car Building—Combination Passenger and Baggage Car.

The trucks were built for standard-gauge service, but the axles are turned and the wheels pressed in to suit our 3-foot 6-inch gauge. However, by moving the shoe heads on the brake-beam and pressing the wheels out to fit a 4-foot 8½-inch gauge the cars could be used on broad-gauge lines. This change of the running gear from that suitable for narrow to that for broad gauge would cost about $15 per car.

Reconstruction Work.

The following list includes a large part of the cars that have been rebuilt:

One express car, lengthened three feet.

One combination express and freight car, changed to

a straight passenger car of the form described herewith.

One parlor car, reconstructed by removing toilet room from closed section, inclosing open section with windows and installing 18 high back plush-covered seats and 12 revolving cane seat chairs of the Wheeler type.

Ten 80,000-pound flat cars, 36 by 9 feet, converted to box cars.

Twenty-one box cars, strengthened by new truss rods, needle beams raised to standard height, Tower couplers, 30-inch double-plate wheels and metal brakebeams applied.

Fifteen flat cars raised to standard height. Tower couplers and 30-inch double-plate wheels applied.

Two freight motor cars raised and vestibule cabs with sliding doors built on each.

Two work motor cars raised to M. C. B. standard height. Tower couplers applied and both cars ballasted with old rails and concrete between side and intermediate sills.

One line tower car raised to standard height. Janney coupler applied and cab rebuilt.

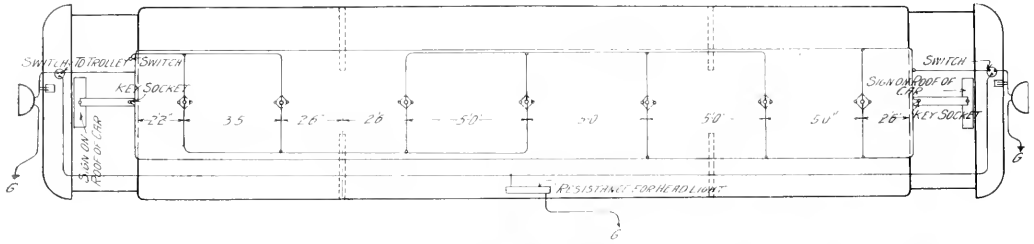
One 4-driver Baldwin locomotive completely overhauled.

One pivot pile driver rebuilt and 20-horsepower boiler installed.

New Construction.

There are in process of construction six passenger cars 47 feet 6 inches long by 8 feet 6 inches wide. These cars will be of the combination type with open and closed sections. The center sill construction consists of four 6-inch 14¾-pound I-beams with Oregon pine fillers. The side sills are of clear Oregon pine, 6 by 7 inches. The interior finish will be of Spanish cedar and all trimmings will be of brass, nickel-plated. The closed sections will have 18 plush-upholstered Wheeler seats and the open sections will have eight Wheeler slat seats. The cars will be painted a dark olive green with gold stripes, numbers and initials. The windows will be of the Pullman style with opalescent glass in each sash. The interior finish and fittings will be the same as those of the straight passenger cars earlier described. The electrical equipment will comprise Westinghouse multiple control with four 101-H motors mounted on M. C. B. type trucks with 5-foot 10-inch wheel base. Westinghouse schedule A M M air brake equipment will be used.

We also have just completed one combination switch and freight motor 30 feet long by 8 feet 6 inches wide, with a center cab 8 feet 6 inches square. The approaches at each end of the cab are 43 inches high at the cab and slope to 12 inches high above the floor line 5 feet back from the buffer. These approaches are 5 feet wide. The cab has four 20-inch sliding doors, one in each corner, opening to the 20-inch passageway between the hand rail along the side of the car and the covered approaches. The air pump and receivers are inclosed inside of these approaches. This car has 6 by 12 inch



Los Angeles & Redondo Car Building—Plan of Light Wiring for 47-Foot Passenger Cars.

Los Angeles & Redondo Car Building—Framing Details of 47-Foot Open and Closed Passenger Car.

side and 6 by 10 inch intermediate sills ballasted with old steel rails and concrete. Wooden draft rigging is used with Tower couplers. The electrical equipment is the Westinghouse multiple-unit control with four 101-H motors, having a gear ratio of 15-69, mounted on M. C. B. type trucks with 5-foot 10-inch wheel base. Westinghouse schedule E T air equipment is used. An accompanying halftone engraving shows the general appearance of this switching locomotive.

The many attractive features of the six new passenger cars and the switching motor are due to C. H. Burnett, manager Los Angeles & Redondo Railway, who has given a great deal of attention to the appearance as well as the convenience of the rolling stock operated by his company.

THERMIT WELDING BY THE CHICAGO CITY RAILWAY.

The Chicago City Railway Company has recently purchased from the Goldschmidt Thermit Company a thermit welding outfit which is now doing excellent service at the

Chicago City Railway—Motor Shell with Thermit Repair.

railway company's shops at Seventy-seventh street and Vincennes road. Repairs have been made during the past week to a number of broken motor shells. These repairs comprise the welding in of broken lugs and housings, as well as repairing cracks in the main part of the shells.

When a damaged shell is to be repaired a line of ½-inch holes is drilled on about 1-inch centers closely following the crack, so that the new metal may have ample contact with the old. Next a brace of bar iron is bolted to the shell so that it will hold closely to their proper positions the axle-bearing lugs and the armature-bearing housing. After the shell has thus been drilled and securely bolted it is sent to the foundry for welding.

The first step in the work after a damaged case is received at the foundry is to burn off all the grease that may cover the iron near the parts to be welded. This burning is done with a large compressed air blow torch. Next the foundryman shapes along the crack a core of beeswax of the exact shape which it is desired to cast the patch of thermit steel. Such beeswax cores are placed on both the inside and the outside of the shell, directly over the row of holes bored through the line of fracture. With the beeswax patches carefully placed the foundryman next covers them with a mass of fire clay, making molds about three inches thick—one for the inside of the shell and one for the outside. As soon as these clay molds which cover the beeswax cores have set they are baked in the foundry core oven; meanwhile the beeswax core is removed. When the fire clay molds have been thoroughly baked they are set against the steel shell in the exact position at which the impression was made and are held there by being banked with sand. To facilitate this holding of the molds in the sand a box is put around the case as it stands on the foundry floor and the space between the box and the case, as well as the interior of the case, is rammed to a striking level with moist sand.

The molds for the patch proper are now ready for a riser and gate, which must be placed so that the hot thermit steel will properly flow in at one end of the opening through the clay mold and out at the other. Next an ordinary foundry flask is set on top of the motor case and its packing of sand. Parting sand is sprinkled about the joint and the flask is rammed full, holding a 2-inch riser and a 1½-inch sprue. The riser is so tapered that at the top of the flask it is about four inches in diameter; and the sprue is so placed that the hot metal will flow freely into one side of the clay mold and continue its course around the fracture and up into the riser on the opposite side.

Next, the cope is lifted and the sand thoroughly dried around the riser and gate openings. A blow torch serves for this purpose and also is used to heat the top of the mold. The metal to be patched is brought to a red heat, so that the thermit steel will not be chilled until it has had opportunity to flow freely around the fracture. When the heating process is completed the cope is replaced, the crucible is set over the gate opening, the thermit charge in the crucible is fired and at the proper time a pouring is made. The result is a patch of thermit steel on either side of the fracture with risers attached, as shown in the accompanying engraving.

After the metal has cooled the case is taken to the machine shop, where the patch is dressed to the desired shape.

THERMIT WELDING AT INDIANA UNION TRACTION COMPANY SHOPS.

Through the courtesy of R. C. Taylor, superintendent of motive power Indiana Union Traction Company, we present the accompanying engraving showing a group of motor cases

Indiana Union Traction—Group of Thermit Welds.

with repair welds made by the Thermit process in the company's shops at Anderson, Ind.

The Indiana Union Traction Company has recently purchased a Goldschmidt Thermit welding outfit and will use this process where it may do so advantageously in the ordinary course of its maintenance work.

The motormen and conductors employed by the Pensacola (Fla.) Electric Company have declared a strike and on Monday a United States mail car was the only one operated in the city. The reason for the strike is said to be a disagreement in regard to working conditions.

SHORT TALKS WITH THE CLAIM INVESTIGATOR—I.

BY F. W. JOHNSON, ASSISTANT GENERAL CLAIM AGENT PHILADELPHIA RAPID TRANSIT COMPANY.

Ample opportunities for advancement to positions of trust and responsibility are today distinctly within the reach of the young man in claim and accident work, provided he is able to demonstrate the fact that he is built of the right material and along the right lines.

Given a man of average intelligence, ambitious, energetic and loyal to the interests of his employer, his success in this work should be assured from the very start. Should he prove lazy, however, or careless, vicious or untrustworthy, it becomes merely a question of time before he will strike his proper rating and be relegated to the scrap heap.

Many young men enter upon claim work with good prospects and the best of intentions, only to fall by the wayside after a brief year or two in the department. The percentage of failures of this sort is higher than might reasonably be expected. Particularly is this true with respect to departments located in the larger cities.

The explanation of this is comparatively simple. Claim work is a business distinctly different in many respects from the ordinary lines of employment to which young men turn in seeking openings in the business world. The work is of a character which demands absolutely certain fundamental qualifications in a man. Provided that he possess these essentions to success in claim work, he speedily becomes a fixture in the bnsiness, his progress from that point on depending solely upon his own individual efforts.

If, on the other hand, he is deficient in this direction, the fact quickly becomes apparent and he soon realizes that in following claim work he not only is wasting his own time, but is as well materially lessening the effectiveness of the department as a whole. Hence the necessity for seeking quick returns upon the investment in judging of a man's value to the department in part accounts for many of the failures among those who enter upon the work.

This shonld not act as a deterring factor, however, in judging of the possibilities for success in the calling—by those already engaged in the work or by those who contemplate entering it. Young men of good character, willing to work and ambitious to succeed, are now and always will be at a premium in claim work. It is a noticeable fact that the standard of efficiency of the average railway claim department has been steadily advancing of late years. Men of greater breadth of view and of higher ideals are being attracted to the work, with a consequent improvement in all directions as a natural result, which fact of itself augurs well for the young man in search of a field of employment which will present unlimited opportunities for advancement.

Conditions governing this branch of electric railroading are, unfortunately, becoming more and more trying each year. Without diverging into an extended discussion of the whys and wherefores of this state of affairs, it may briefly be observed that the attitude of a very considerable portion of the traveling public toward transportation companies, with respect to the matter of claims for personal injuries, is of such a character as to place the said railway companies constantly on the defensive. Such being the fact, it follows with logical sequence that railway companies must necessarily bend every effort toward equipping their claim departments with as capable men as may be obtainable.

In selecting men for vacancies in the claim department the average street railway management considers as eligible only men who possess clean records for faithful, intelligent service in the past—men who not only may be trusted implicitly, but who also give promise of future development. A distinct compliment is thus paid by a company to the young man whom it admits to employment in this important branch of its work. In thus placing their stamp of approval upon him, the officials of the company certify to their entire confidence in him by entrusting to his care work of a decidedly confidential nature, requiring no other assurance of his trustworthiness than their own belief in his absolute loyalty.

Here it is, then, that the young man encounters the first real test of his value to the company, as well as of his future success in claim work. Possessing a sturdy spirit of loyalty to his employers, his shortcomings in other directions may oftentimes be overlooked. Lacking this essential, however, other qualifications will avail him naught. It is but natural that the average man should, with becoming modesty, credit himself with the possession of this sterling quality, generally to a marked degree. And the average worker in the ranks of the claim department is no exception to this general rule.

Let it be said to the claim man's credit that instances of deliberate disloyalty upon the part of railway investigators, inspectors and adjusters are indeed rare. As in all other lines of employment, there occasionally crops up a man who will voluntarily wreck his business career by branding himself as a fraud. Comment upon such weaklings is unnecessary. Their pitiful careers in the business world eloquently tell their own story.

In the main, however, experience has proven the railway claim investigator a sturdy type of manhood, faithful to his duty, ambitious to succeed in life and ever alert to protect the interests of his employer.

Loyalty to an employer need not necessarily be demonstrated through the medium of some unusual or heroic achievement. Opportunities for brilliant, spectacular work are comparatively few and far between, even in the larger departments the element of chance playing a leading role in distributing these "short cuts to promotion."

To every man, however, is afforded the opportunity of proving his loyalty by giving to his employers his best efforts toward the faithful execution of such tasks as may be assigned to him—not occasionally—not now and then at spasmodic intervals—but day after day, week after week and month after month. The harder the assignment the greater his determination to carry it through to a successful termination, in other words, to do his level best all the time.

Gradually the fact becomes apparent that So-and-So is rounding into a valuable man for the department. His development is watched with close interest by his superior officers, for they begin to recognize in him indications of the material from which lieutenants are constructed.

Simultaneously it begins to dawn upon the investigator that his assignments are becoming more and more difficult. He is finding it harder and harder to secure his statements and releases, because of the increasing seriousness in the character of the cases assigned to him. If it is his nature to act first and think afterwards he very probably enters a vigorous protest against the other men being favored with the easier assignments, while he himself is receiving more than his fair share of the tough ones. In this event he proves himself painfully short-sighted.

If, on the other hand, his heart is in the business and his eye is on the future, he welcomes work of just this character, for well does he know that in selecting him for critical assignments the company is systematically training him with a view to future promotion.

But behind all of this lies a fact of even greater significance. Before ever he was assigned to work of this nature the officials of his company had satisfied themselves of his absolute loyalty to the interests of the department.

Loyalty in business does not consist solely of a general observance of the principles of honesty and truthfulness—not by many leagues. While these qualities are absolute necessities to success in claim work, as in fact in all other lines of employment, they of themselves alone leave much to be desired.

In claim work much necessarily is left to a man's honor.

If he so elects it is a comparatively simple matter for him to deceive his chief, for a limited time. It is, of course, possible for him to obey instructions in a sense, while at the same time disregarding utterly the spirit in which they were given. No better test of this is possible than for an investigator to ask himself, "Am I doing my level best for the company?" Let him disregard for a moment the avalanche of "ifs" and "buts" which invariably spring into activity at a time such as this. Meet the issue squarely and decide the question upon its merits.

A man may voluntarily choose to deceive others for a time, but when his own future success in life hangs in the balance and he is sufficiently in earnest to weigh cold, hard facts in the light in which they actually exist, there is at least one man whom he cannot fool. That one man is himself.

Consider for a moment the ease of the young investigator who telephones into headquarters at the close of the day to the effect that he "has been busy the entire afternoon, but has been unable to see witness Frank Maxwell."

In a sense it was true that he had been "busy" the entire afternoon and likewise that he had been unable to "see" witness Maxwell, which facts in themselves were nothing alarming, since his "busy" afternoon had been spent in rooting hard for a victory for the home team out at the American League grounds. These latter facts, however, he neglected to mention in his report to the chief.

In thus taking valuable time off duty without permission the investigator doubtless gave the matter but little serious consideration aside from the framing up of a suitable excuse to shield him from detection. That he was voluntarily placing an obstacle in his own path to success probably never occurred to him. Not that this single incident of itself alone was of such vital importance, but because it established beyond contradiction the fact that loyalty to his employers was lacking in his make-up.

Again, take the problem presented by the investigator who devotes more time to studying his own ease and comfort than he does to the securing of results in his work. We will say, for example, that he has been given the address of a claimant as 3337 Washington avenue. He calls at this address and finds it to be a Chinese laundry with no such party residing there. He lets it go at that, reports to headquarters that the address is fictitious and makes no further effort of his own volition to run the claimant down.

Yet no one knows any better than does he himself that some error doubtless has been made in writing down the number. Instead of canvassing the vicinity and of then working numbers 337, 333 and 37, he prefers to lie down on the assignment, with the chances thereby strengthened for a miscue in the company's wishes regarding that particular case. Loyalty to his company is at a low ebb with him. Otherwise he would have done his level best to have located that claimant.

While men of the character cited in the foregoing illustrations may have redeeming features in other directions, nevertheless the absence of loyalty, from a business point of view, constitutes a fatal defect in their equipment for successful work in the claim and accident field.

Absolute loyalty to an employer counts heavily in judging men for promotion in the claim department. It is a matter well worth careful thought upon the part of every young man engaged in the work.

[The second "Talk" with claim investigators will appear in an early issue of the Electric Railway Review.—Eds.]

It is announced that a syndicate has been formed in Rome to build a power plant at Treni, in Apulia, to produce current for the operation of three railways, from Treni to Corato, from Treni to Andria and from Fernandino to Trinitanople. The station will also supply current to surrounding towns.

EMPLOYMENT OF TRAINMEN ON METROPOLITAN ELEVATED RAILWAY.

The Metropolitan West Side Elevated Railway of Chicago operates several branches covering a large district in the west side of Chicago. The present management of the company has made changes in the system of hiring and instructing trainmen, which now follows in many respects the practice of some steam railways. Owing to the large number of applications at present the standard to which applicants must conform is higher than during times when requests for employment are fewer. To be considered favorably applicants now must be at least 23 years of age, 5 feet 10 inches in height or over and must have had previous railway experience.

Sight, Color Sense and Hearing.

An applicant for a position in the train service is required to fill out an application blank. When satisfactory responses have been received by the company to letters of inquiry sent to former employers and to those to whom references as to character are given, the applicant is obliged to take an examination to determine whether his eyesight, ability to distinguish colors and hearing are of the standard required. During this examination the applicant is first required to read various sizes of small type and also standard test type, which is displayed under electric light. He is obliged then to test the correctness of his color sight. Rapid changes in colored lights are made by the examiner with a test lantern manufactured by Peter Gray & Sons, Inc., of Boston. This lantern contains six colors, the relative position of which can be transposed in order that the correctness of the sight of the applicant may be thoroughly tested. If the result of this test is not satisfactory another test with skeins of wool is insisted upon.

A regular form is provided for the "record of examination of sight, color sense and hearing." This form provides for a record of the tests as to the acuteness of vision without glasses, showing the distance in feet at which the standard test type is read and the smallest line of standard test type is read correctly with the right eye, the left eye and with both eyes. The examiner notes on the form whether the selection of skeins is made promptly or hesitatingly. The form provides space for stating the number of feet at which the applicant can hear and repeat correctly numbers or words spoken in a conversational tone. Both the right and the left ear are submitted to this test. Space is also provided on the form for any remarks in relation to the sight or hearing of the applicant, who is asked to sign the report.

After passing this test satisfactorily an applicant is then interviewed by B. I. Budd, the general manager, and if his general appearance and the references make it evident that he would be a desirable employe he is provisionally employed and given an order for a uniform cap, but not for a uniform. The applicant is then directed to report to M. J. Feron, superintendent of train and station service, who gives him an outline of the duties of a guard, dwelling particularly on the necessity of exercising care in giving signals, closing gates, etc.

The next step is to send the applicant to an instructing conductor, who teaches him the duties of a trainman, taking three days or as much longer as may be necessary. The conductor reports to the superintendent on a blank form regarding the progress made by the applicant. The applicant is also instructed by the dispatcher. After these instructions have been given the dispatcher notifies the superintendent that he has instructed the student regarding schedules, bulletins, orders, assignment list and reporting time as posted at the terminal to which the man is assigned. The dispatcher also teaches the man how to couple and uncouple air and power hose and cables and to turn the lights and heat on and off in cars, and warns him regarding the danger of the third rail in the yard and on the structure. Hose are fastened to the walls of the different terminal houses in order that instruction

as to their use may be given. At the end of this period of instruction the applicant reports to the superintendent for examination and if it is then believed that he will make a good employe he is assigned to the position of an extra guard and is directed to purchase a uniform. During the first two months of service a new employe is subject to the supervision of service inspectors in order that his familiarity with his duties may be proved.

Credits Determine Standing.

When an applicant is employed he is given 100 per cent credit. A record of each employe is kept by a card system; for each month after entering the service, if no offense requiring discipline has been given, an additional credit of 2 per cent is added to the initial 100 per cent. For committing an offense an employe is fined a certain percentage. This has the effect of causing him to lose standing. The chances for promotion, choice of run, etc., are determined by the standing shown in the percentage cards. When an employe passes from one class of position to another, as from guard to conductor or conductor to motorman, he begins in that service with a similar credit of 100 per cent. Some of the oldest conductors and motormen in the service, whose standing is good, arrange their runs so that after 10 hours' work each day they are given employment as platform men for an hour and a half during the evening rush hours.

In the course of time a man who enters as an extra guard, provided his record is good, is promoted to the position of regular guard with a regular run. The position of conductor is secured by promotion from the list of regular guards. A regular motorman obtains his position through promotion from the list of conductors after he has had experience and has qualified as extra motorman. After an employe has been in the train service a certain length of time he may make application to learn the duties of motorman. The application must be approved by the dispatcher on the branch on which the man is working and must be sent to the superintendent. No regular limit is fixed as to the time an employe must be in the service before the application will be approved by the superintendent. The length of time depends upon the former experience of the employe, his age and general qualifications. A man who has had previous experience as a switchman or brakeman on a steam railway will be approved as a student for instruction in the duties of motorman as soon as he is familiar with the elevated railway. After the application is sent to the superintendent the employe is notified to appear before the superintendent. If on this occasion he passes favorably a general examination as to his knowledge of the road and the duties of a trainman and the superintendent feels that the man may be able to become a good motorman, the application is approved. The superintendent cautions the employe regarding the importance of his duties and warns him as to the necessity of always being alert and attentive to his work and of being careful to observe the condition of the rails, speed on curves, etc. The employe is then sent to the surgeon of the company, and if his physical condition is found satisfactory he is given a permit to ride with an instructing motorman.

The instructing motorman first gives the student an outline of the equipment and the operation of the apparatus without entering upon any details which would confuse him. The student then is allowed to make several trips in the cab with the instructing motorman, but is not permitted at once to operate the car or to handle the air brakes. The notice of the superintendent regarding the assignment of the student states that the instructing motorman will be in general charge of the train and responsible for its safe operation. A student is permitted to operate a train only when, in the judgment of the instructing motorman, it is safe for him to do so.

Studying Duties of Motorman.

The instructing motorman directs the student as to signals, train operation and troubles with which he may meet in the apparatus, as indicated on an instruction blank provided by the transportation department. The introduction to this instruction blank states that the questions are intended "to assist motormen in giving proper and uniform instructions to students. All motormen 'breaking in' men must see that students thoroughly understand the operation of trains in accordance with the rules and regulations of this company and that they are fully acquainted with all conditions a knowledge of which is necessary for safe operation." This blank contains 84 questions and answers. The accompanying illustration shows some of the questions and answers.

12. What form of air brake do we use?.....	12. Westinghouse automatic with graduated release.
13. Why is it called an automatic brake?.....	13. Because if anything causes a reduction of pressure in the train pipe the brake will apply automatically.
14. What are the parts of an automatic brake on a motor car?	14. See Rules Nos. 189 to 199.
15. Where are the motorman's brake valves and gauges located?	15. In cabs.
16. How is air compressed for use in the brake system?...	16. By air compressors or pumps placed under the cars.
17. How does the air apply the brakes?.....	17. By being admitted to a brake cylinder and forcing out a piston which by means of its connecting rods and levers forces brakeshoes against the wheels.
18. How is the brake released?.....	18. By allowing the air in the brake cylinder to escape to the atmosphere. A spring in the brake cylinder then shoves the piston back and the brakeshoes, assisted by truck release springs, will leave the wheels.

Employment of Trainmen on Metropolitan Elevated Railway—Sample Questions and Answers from Motormen's Instruction Blank.

Precautions Observed.

The instructing motorman is required to sign a statement that he has directed the student concerning "the safe operation of a train in service" and has "fully acquainted him with all signals, speed limits, station stops and general conditions existing on ..... branch." The instruction must be completed and the student ready for examination at the end of 60 days. When the student reports to the superintendent for further examination he is expected to be able to answer any or all of the questions on the motorman's instruction blank. The student must sign a statement that he has received instructions from the instructing motorman and an examiner is required to certify that the student is competent to operate a train with safety and according to the rules and regulations of the company.

The superintendent sends a personal letter to the instructing motorman regarding the student, which says that the student must not be reported until the instructor is "satisfied that he understands thoroughly the apparatus of our motor cars and is perfectly familiar with all signals, speed limits, station stops and the general conditions existing on our road. You will also advise me of the number of trips he made with you, his general ability to handle trains and also

his weak points as noticed while he was with you. This information will be considered strictly confidential and is to be returned to me in an envelope marked personal."

The superintendent examines the student on every detail of the duties of a motorman. After this examination has been passed satisfactorily the student reports to the general manager and, if then accepted, is placed upon the acting motormen's list and is given extra work as the opportunity may occur.

Switchmen, towermen and switch tenders are selected from the extra guard list, preference being given to men who have had former railway experience. A student switchman is obliged to pass the same examination as a student motorman before he is accepted as a competent switchman.

The foregoing information was furnished by Calvin E. Patten, secretary to the president, Metropolitan West Side Elevated Railway.

CUTTING NEW PINIONS FROM OLD PINIONS—INDIANA UNION TRACTION COMPANY.

The Indiana Union Traction Company has just put into practice in its new shops at Anderson, Ind., a "shop kink" which is interesting and shows a decided economy. The company has 11 different varieties of motor equipments and it has been found possible to take the worn-out pinions of the larger sizes, turn off the worn-out teeth and recut new teeth in the blank, making a new pinion from an old one.

As there was no gear cutter or milling machine in the shops an attachment was made to do the work on one of the lathes. A casting was fitted on the cross slide of the lathe, as shown in the illustrations. On top of this lower casting was

Indiana Union Traction—Recutting Pinions—Rear View, Showing Index Centers.

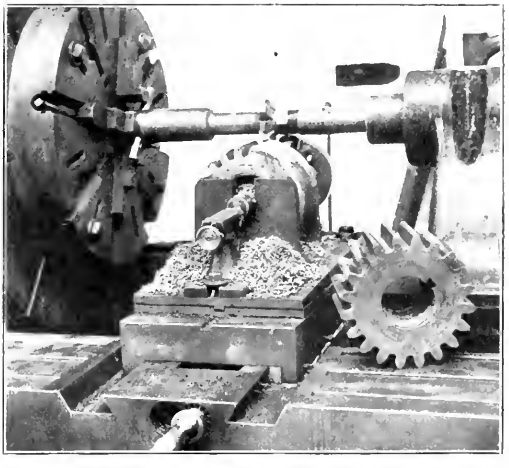
fitted another which carries the index centers and the pinion. In order to get the proper adjustment for depth of tooth these two castings are joined by inclined surfaces, the upper one arranged to slide along the lower inclined surface until the blank is set at the proper height for the depth of tooth to be cut. The teeth are spaced by an index head. The cutter is carried on a mandrel, but the smaller end, instead of being supported on the tail center, has a sleeve surrounding it close up to the cutter.

This device was designed sufficiently strong so that it would be possible to do rapid and accurate work. The teeth of a $2\frac{1}{2}$-pitch steel pinion are cut to the full depth at one cut. The cutter is speeded to 52 feet per minute and the blank fed against it at a speed of 1 inch per minute. Lubricating fluid is forced against the cutting edges with compressed air.

With this device a 20-tooth $2\frac{1}{2}$-pitch Westinghouse 50-C pinion was made from an old Westinghouse 85-27 tooth pinion at the following cost:

Turning blank, one hour's time at $17\frac{1}{2}$ cents per hour	$0.175
Cutting teeth, three hours' time at 15 cents per hour	.45
Scrap value of worn-out pinion, 110 pounds at $\frac{1}{2}$ cent per pound	.55
Total cost of recut pinion	$1.175

Besides the economical value of this practice there is the additional advantage that instead of having to carry 11



Indiana Union Traction—Front View, Showing Attachment to Cross Slide for Holding Blank.

different varieties of pinions in stock only four kinds are now required. This apparatus was designed and made at the company's shops at Anderson, Ind., which were described and illustrated in the Electric Railway Review for January 18, 1908, page 67, in an article written by R. C. Taylor, superintendent of motive power.

Accidents Discussed in Baltimore Bulletin.

Part II of Bulletin No. 7 in the series published by the United Railways & Electric Company of Baltimore is entitled "More About Accidents and Their By-Product, the Ambulance Chaser." The company states its policy as follows:

"All cases are settled out of court except where, after careful investigation, we believe: (1) That the claim is a manufactured one; (2) or that the injury was due to gross carelessness on the side of the claimant; (3) or that the claimant is demanding excessive damages. Statistics show that in more than half the cases tried the plaintiff gets nothing from the jury; and that in a large proportion of verdicts for the plaintiff the amount recovered (which the plaintiff must divide with his lawyer and the latter's 'runner' and 'medical expert') does not exceed the sum which could have been secured without litigation."

The bulletin concludes by pointing out ways in which people interested in securing a "square deal for good service" can help the company.

The Philadelphia Rapid Transit Company is said to be considering the adoption of pay-as-you-enter cars.

THE RELATION BETWEEN BANKER AND ENGINEER.*

BY J. C. KELSEY.

In all public utility financing you will find the bankers. They are as necessary as doctors and nurses in a plague. They furnish the respectability and responsibility, and take their allotments of the issue.

President Roosevelt has apparently caused some trouble in the financial world, but he is only taking up the people's cry for investment protection. He has aimed no blows at the honest banker or the honest security dealer. He has paved the way for the glaring exposure of the security faker.

Most of us have a childhood recollection of the mortgage on the farm. It was a gloomy substance and it cast sinister shadows over our youthful pastimes. It filled our hearts with dread. At Christmas time, even traditionally kind Santa Claus passed us by, because he, too, dreaded the mortgage; so the whole family struggled with sickening fear clutching at our hearts. And why? Because a first mortgage upon that home was and is a safe investment—a real security for the holder. It holds the property at a sacrificial figure. The value of the farm exceeds considerably the face value of the loan. The terms of that mortgage are such that the family will not think of giving up the property, but will manfully struggle to meet payments when due. At no time is the holder of that mortgage uneasy; but in the general security market the shoe is on the other foot. The word no longer signifies the slavery and bondage of the property, but mostly signalizes the folly of the holder.

We all know of properties that are bonded for more than their value and earning power and each day we hear of companies defaulting on interest. The widow who once looked hopefully forward to coupon clipping time and the return of the check now has reason to dread a notice coming through the mail, accompanying her coupons, informing her that a receiver is in control of the property and that her investment is hopelessly tied up; or, more futile still, that a committee has been appointed to investigate what caused the wreck. It is the old story of locking the barn door after the horse is gone.

The banker, whether conscious or not, has been and is a security faker. Not in all cases, of course. There are savings banks in Chicago which, in paying 3 per cent to frugal depositors, try to make us think they are public benefactors. Scattered about on their counters one will find prospectuses of bonds, telling alluringly of good things. The banker does not care to have the depositor's funds withdrawn, but if he can sell a bond at $100, netting the frugal depositor 5 per cent, instead of 3, and netting the banker $35 or $45, of course, he willingly advises the depositor to buy it. If this banker would carefully investigate the property he might not find it desirable. He might find that there was no contract regarding its management. He might learn that there was no provision for an honest renewal reserve. The worst of it is, judging from security prospectuses seen lying around, he does not care. He simply sells bonds at a profit, washes his hands of the deal and denies that he is his brother's keeper.

We have a feeling of indignation when we read of the abandonment of a helpless infant upon a front door step, and the persons involved take no more precaution than to ring the bell. Yet the man who sells a security and runs away after collecting the money deserves our indignation. He is an unnatural father and deserves punishment. According to the "square deal" the banker who sells securities should father them. He should be responsible for them, and should be willing to buy them back at any time there is a hitch in interest payment, or any entanglement thereupon. There is a banking house in New York which handles immense issues of securities. At one period of its successful existence, through misrepresentation on the part of an adviser, the house got hold of a disappointing property. After selling thousands of dollars' worth of securities the erratic features of the deal were discovered. Did these people make the usual whine that they "didn't know" and thereby and forthwith abandon the luckless buyers to their fate? No, this house, situated in that alleged to be heartless and soulless Wall street, promptly notified the buyers of the deception and paid them back dollar for dollar. In other words, this firm fathers the bonds it sells. And this brings out the relation of the banker to the engineer.

If the banker does not wish to be deceived as to the worth of the property he must have competent advice. Not only must the auditor go over the books, but the engineer must go over the physical property. He must understand the needs of the property, not only now, but 10 or 20 years hence. He must thoroughly understand depreciation. He must be thoroughly familiar with the best operating methods and able to judge exactly as to the competency of the management.

The engineer must be a business man. Engineering is a business and not a profession, as some are determined to have it. The successful engineer may stand for ideals, but he bears in mind the natural demands of the banker and public, that the property receive sufficient money, pay out money, and, like the individual, save money for a rainy day. This homely expression signifies the necessity of what is called the renewal reserve. In all properties owned by security-holders there is a sacred necessity which lies in the saving of enough money out of the daily or yearly income to take care of all changes in the art, all destruction due to the elements, and to hold the value of a $100 security at $100 or over for all time.

As the property wears out it decreases in value. Assume that, in a certain time, it decreases to a value of 90 cents on the dollar. Then the security owner is entitled to be assured that the necessary 10 cents is in the reserve treasury and available for the purpose of holding the value at 100 cents on the dollar; in other words, to be sure that there will be no assessments, or cessation of dividends, to take care of depreciation.

The renewal reserve charges should come ahead of the bond interest. If a property cannot pay renewal reserve charges and bond interest simultaneously there should be a default. A property that is not protected by a cash renewal reserve is not a real conservative investment. Book reserves are of no value, and reserves invested in the property itself do not carry out the idea of security. Railroads could invest reserve funds in tie property or coal lands and carry out the idea nicely, and electric light, trolley and telephone systems could safely invest reserve funds in the municipal bonds of their immediate localities and carry out the idea of absolute security; but this idea is rarely fulfilled.

The engineer takes the following part in a contract between the banker and the property management, after the questions of reserve and other details are settled. The contract should contain the following thoughts at least:

"The engineer of the bankers shall be furnished every facility to inspect the plans proposed for construction of extensions and improvements, the contracts and prices paid for labor, material and incidentals connected therewith; and the work during its progress, in order that he may certify that the plans adopted are the most economical to produce the best results, that the prices paid are the lowest consistent with first-class work, and that the work has been executed within the terms of the mortgage. He shall have access to all operating departments, and shall be furnished with all desired information. He shall have power to make tests, and to criticize operating methods. He shall report directly to the bankers, and said report shall not necessarily be accessible to the active management of the property."

It is understand that the contract gives the banker power to act upon the recommendations, but that is another story. With such a clause as this the banker has direct means of knowing accurately every vital point concerning the property he has so nicely described to the public. If the management of the property is niggardly with maintenance and repair, thereby rendering the contracted renewal reserve fund insufficient, the banker can call a halt. If the management is extravagant in operation and conduct of the business, thereby endangering bond interest, the banker knows it before it is too late.

The day is coming when all public utilities will have to take a defined position. Through the medium of broad-minded state commissions, properties will be conducted differently in the future. They will have to meet public demands promptly. They will not dodge taxes. They will be responsible for their employes' safety. They will have to co-operate with municipalities in beautifying cities. They will have to maintain renewal reserves and shall be ordered to invest them by law. Under the new order, securities will be guaranteed because the property has conformed to the commission's orders. There will be many things required of the companies that would give the present directors and legal advisers apoplexy. This tendency means simply a closer study of reserves. The state commissions are studying the matter with us, and as engineers we shall help them to arrive at good conclusions.

The panic of October and the subsequent decline in business activity was not caused by President Roosevelt or the New York stock exchange. The recklessly run trust companies temporarily furnished the germ of overprosperity, and later their own game of imbecile finance paid the penalty. Any security was snapped up by these concerns, and for a time they made fabulous profits; but the old saying, "Truth is

*Abstract of address delivered before the Western Society of Engineers, Chicago, April 10, 1908.

mighty and will prevail" proved itself once more. Then followed a panic of distrust, ruin and suicide.

But a new day is dawning. All things commercial will have to be satisfied with less profit, because lessened risks will be demanded. The sober-minded public which does the investing will demand reasonable profit, and absolute safety. The public will always have money to invest. There will always be a chance to invest. The public will always invest through the banker. The banker will have to practically guarantee his investment advice if he expects to survive. To do this he will seek the engineer.

The investments of the public will be guaranteed in their fullest sense only when there is a wedded relation between the ideals of the banker and engineer.

NEW CARS FOR THE BUFFALO LOCKPORT & ROCHESTER RAILWAY.

The Buffalo Lockport & Rochester Railway of Buffalo, N. Y., which expects to complete before July 1 its line from Buffalo to Rochester, N. Y., will soon receive from the Niles Car & Manufacturing Company 15 combination passenger smoking and baggage cars, as illustrated in the accompanying engraving, and two express and baggage cars. The dimensions of the passenger cars are as follows:

Length over buffers	51 ft. 8 in.
Length over vestibules	50 ft. 4 in.
Width over side panels	8 ft. 4 in.
Length of smoking compartment	11 ft. ½ in.
Length of main passenger compartment	26 ft.
Height from rail to top of trolley bridge	12 ft. 3 in.
Width over all	8 ft. 6½ in.

The side sills are of yellow pine, 4½ by 7¾ and 2 by 6 inches, with a ½ by 6 inch steel channel bolted between. The four intermediate and center sills are 6-inch steel I-beams. The platforms at each end are flush with the car floor, the center sills extending from buffer to buffer under the vestibules. The floors are laid double with heavy building felt placed between the two sections.

The interior is finished in first quality mahogany. The ceiling is semi-empire style, painted and decorated in green and gold. Polished American plate glass is used in all main sashes and cathedral art glass in the upper sashes. Pantasote curtains with Burroughs roller tip fixtures are fitted to all windows. The seats are of the Heywood Brothers & Wakefield Company's manufacture, 36 inches long, with an aisle arm rest, the aisle being 19 inches wide. The seats are of the head roll style, with backs 24 inches high, and are fitted with bronze grab handles. The upholstering in the passenger compartment is Nile green plush and in the smoking compartment first quality leather. Each car has a toilet room with cement floor and Metile lining.

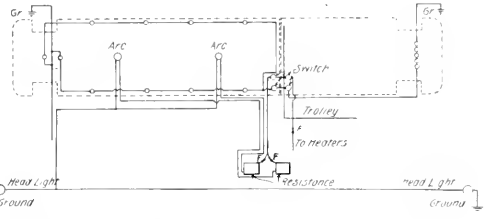
As shown in the engravings, the cars have double buffers. The upper one, which is fastened directly to the car sills, is for interurban service; the lower one is of a height corresponding to that of the city cars of Buffalo and Rochester.

Both the passenger and the express cars are mounted on Baldwin heavy interurban trucks, with Standard solid forged and rolled steel wheels. The wheels are 36 inches in diameter, with 3-inch tread and ⅞-inch flange, and are mounted on Standard hammered steel axles 5½ inches in diameter at the center, with 5 by 9 inch journals. Symington journal boxes are used.

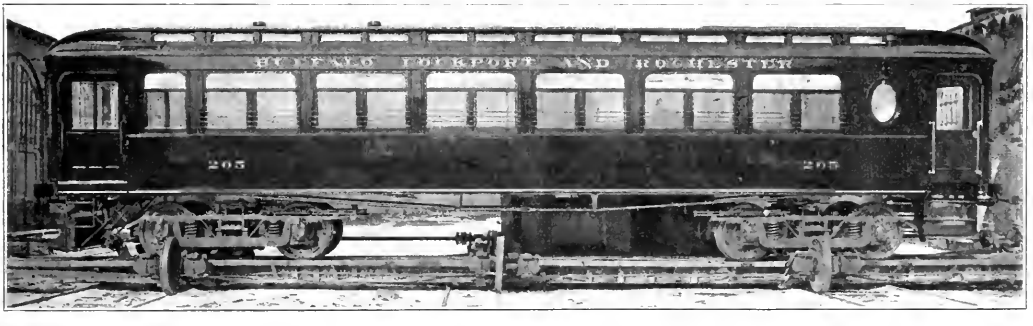
Each car is equipped with General Electric No. 73 75-horsepower motors and Westinghouse automatic air brakes. The special equipment includes Peacock "C" drum brakes, with Dayton No. 11 bronze ratchet brake handles, two Nichols-Lintern air sanders on the front of each car, Consolidated Car-Heating Company's No. 24 electric heaters fastened to the truss plates and Kalamazoo snow scrapers.

ARC LAMPS FOR ILLUMINATING CAR INTERIORS—METHOD OF WIRING.

In the Electric Railway Review for March 14, 1907, page 318, we discussed the value of arc lamps for illuminating car interiors, mentioning several companies which favor this practice. The accompanying sketch presents the main car wiring circuits for the large high-speed cars of the Pacific Electric Railway at Los Angeles, Cal. It will be noted that these cars are lighted with both incandescent and arc lamps. The two interior arc lights are connected in parallel and the pair is connected in series with the headlight, as shown in the sketch.



Pacific Electric Railway—Light Wiring for Arc Lamps.



Combination Passenger Smoking and Baggage Car for the Buffalo Lockport & Rochester Railway.

Cars illuminated with arc lights present a more brilliant effect than when incandescent lamps are used. Those roads which employ arc lights for illuminating the interiors of their cars consider this method as a vast improvement over incandescent lighting, especially on interurban lines where the voltage regulation is not usually any too exact.

The pay-as-you-enter cars which were placed in operation on January 5 by the International Railway of Buffalo on its Niagara avenue line have proved so successful that it has been decided to use this type of cars on the Grant street line also. The cars formerly used on Niagara avenue are now being remodeled into pay-as-you-enter cars at the company's Cold Spring shops.

THE STRANG GAS-ELECTRIC MOTOR CAR.

The gas-electric motor car as used for transportation purposes has reached a stage of development where considerable attention is being given to the particular service requirements which it is capable of filling. This type of car is designed for use on roads where the traffic is not sufficiently dense to warrant the operation of steam trains or electric cars on short headway. A new car of this type has just been built

Strang Gas-Electric Motor Car—Interior View.

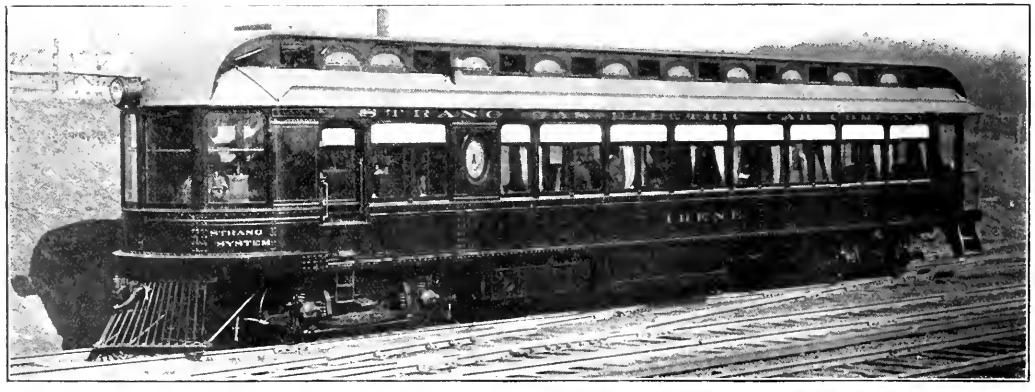
for the Strang Gas-Electric Car Company, 15 Wall street, New York, by The J. G. Brill Company, Philadelphia. A number of new and interesting features, both of construction and operation, are included in its design.

The Strang system consists of a gas engine with a direct connected generator, electric transmission and control, direct electrical connection between the generator and truck motors and a storage battery. The operation of the car is practically the same as an interurban trolley car, but, unlike the trolley car, it produces its own current and is therefore independent of trolley wire and power house. The generator and engine have a capacity sufficient for normal requirements, but when starting or when ascending a grade the storage battery takes care of the "peak" of the load. The storage battery is charged while the car is coasting down grades, coming to a stop or standing still; the gasoline engine running until it is automatically throttled as the batteries attain the full capacity.

The one serious objection to a type of car employing a combination gas engine and electric generator has been the vibration, which in some instances has been noticeable to a marked degree. In the construction of the new car the sills and framing have been designed with a view to preventing this vibration. The two steel center sills extend from bumper to bumper. At that end of the car where they pass directly under the engine these sills are much heavier than at the trailing end of the car. This weight provides the strength necessary to support the engine and generator and by the tapering to a smaller size at the rear affords a strong underframe of comparatively low weight. The arrangement of the side framing does not differ materially from that used in steel car construction.

The car measures 66 feet over all, is 9 feet 6 inches wide and 14 feet high. The weight complete is 114,000 pounds. The engine is of the vertical 4-cycle type, having six cylinders 10½ by 9 inches, with a continuous rating of 150 horsepower at 425 revolutions per minute. The generator is of 85-kilowatt capacity at 250 volts. It is a direct-connected shunt-wound interpole machine. There are two interpole motors of 100 horsepower each, series-wound for 250 volts. The battery comprises 112 Planté type cells, having a capacity of 300 ampere-hours; General Electric type M control with bus connections for supplying current to a second car, and Westinghouse automatic air brakes. The cooling and heating system consists of an electrically driven centrifugal pump which circulates the jacket cooling water through either the radiators on the roof or through the heating pipes in the passenger compartment. The engine end trucks are the Brill 27 E-3 type to carry 73,000 pounds, and the trailer trucks are the Brill 27 E-2 type to carry 42,000 pounds loading. The special equipment includes Janney automatic couplers, Nichols-Lintern sanders and Adams & Westlake baggage racks.

The interior of the body is divided into an engine room, 13 feet long, and two compartments, smoker and parlor. An observation platform at the rear will conveniently seat five passengers. The total seating capacity is 75. There are eight double windows in each side of the car and over every other side post is a small semi-circular window for ventilation. The interior finish is in vermilion wood with ventilating windows of art glass and an art glass panel above each double window.



Strang Gas-Electric Motor Car—Exterior of New 66-Foot Car.

In starting the engine power is fed from the storage battery to the generator, which, acting as a motor, drives the engine up to speed. The car carries sufficient gasoline to run it 200 miles and consumes about six-tenths of a gallon per mile. The engine cooling system consists of radiators placed on the roof of the car and a circulation secured by a motor-

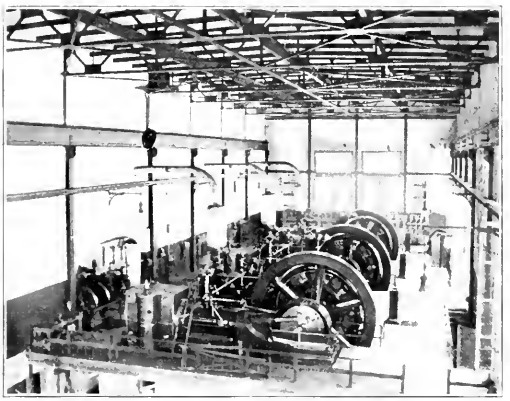
driven turbine pump. The passenger compartments are heated by pipes connected with the water system. This car will maintain a speed of 55 miles an hour. It can be made the motor car of a train, being capable of hauling three trailers carrying 75 passengers each. In the event of mishap the double system of power allows its batteries to carry it, for 15 miles if necessary, to a roundhouse or station.

The car body was designed by W. B. Strang, president, and L. G. Nilson, chief engineer of the Strang Gas-Electric Car Company. The engine and accessories were designed by Mr. Nilson and the generator and motors were designed and built at the Strang company's shops under the personal supervision of Messrs. Strang and Nilson.

POWER PLANT OF THE CENTRAL PENNSYLVANIA TRACTION COMPANY.

BY L. G. MORRIS.

The Central Pennsylvania Traction Company of Harrisburg, Pa., operates about 64 miles of track in Harrisburg, Steelton, Highspire, Middletown, Penbrook, Progress, Oberlin, Paxtang and Hummelstown. The power plant of the company, a preliminary description of which was presented in the



Central Pennsylvania Traction Company—Interior of Power House.

Street Railway Review for May, 1906, page 296, is located about 1¼ miles from the electrical distribution center of the system. The building is 40 feet high and occupies a ground space 175 by 103 feet. It is constructed entirely of concrete and steel, the roof also being of concrete reinforced with ⅜-inch rods and covered with tar paper and slag roofing. The building is divided longitudinally into two rooms. In the front section are the main engines and switchboard, in the rear is the boiler equipment. Only about one-half of the floor space is occupied by the present equipment.

The center bay of the rear section or boiler room is used as a pump room and in it is installed the pump apparatus, comprising the boiler feed water, circulating water and air pumps, and the feed water heater. The floor of the second story of this section is constructed of steel beams and carries the economizers and the main smoke flue. On this floor and extending the full length of the space corresponding to that occupied by the boilers on the first floor is a coal bin having a capacity of 600 tons, from which coal is delivered by means of a traveling hopper to the boiler room below. Near the center of the building and under the track of the siding is a hopper which receives the coal as it is dumped from the cars. The coal first passes to a crusher and then to the boot of a vertical chain-and-bucket elevator. This elevator delivers the coal to a screw conveyor in the roof of the building, by which it is distributed to the coal bin. The ashes drop from hand-fired Regan shaking grates to pits, from which they are removed in a steel dump car to the elevator boot, which carries them to the bin. From the bin they are delivered by means of a chute to a waiting car on the siding for final disposition. A reinforced concrete stack 215 feet high from the ground, with an inside diameter of 10 feet and resting on a solid rock foundation 20 feet below the surface, serves the boiler plant.

The present steaming equipment consists of five 327-horsepower water tube boilers, operated at a pressure of 175 pounds. These boilers were built by E. Keeler & Co. of Williamsport, Pa. Additional equipment, consisting of two Babcock & Wilcox boilers of 600-horsepower capacity each, has been ordered for installation in the near future.

A 30-inch jet type barometric condenser, built by the Allberger Condenser Company, is used. The water is delivered from the Susquehanna river to the condenser by means of vertical-shaft centrifugal pumps, installed in duplicate. The pumps and the horizontal engines which drive them were built by the Morris Machine Works. The boiler feed water pumps are of Worthington manufacture.

The main engines were built by the Allis-Chalmers Company, all of the three engines being alike in construction and of the horizontal cross-compound rolling mill type, with cylinders 22 and 48 by 42 inches. Each engine weighs 220,000 pounds and has a clearance of 5 per cent. Garlock metallic packing is used throughout. Richardson sight-feed oiling sets are fitted on the cylinders and the balance of the oiling is done by gravity system. The main shaft carries a 50,000-pound flywheel and the armature of the generator. The generators are of the Allis-Chalmers-Bullock railway type, having a rating of 600 volts and 1,084 amperes and will carry 50 per cent overload for hours without heating more than 40 degrees above normal. The armature weighs 38,500 pounds. The dimensions of the commutators are 80 by 12½ inches.

The switchboard was built by Westinghouse Electric & Manufacturing Company and comprises 26 panels equipped with all the latest improved instruments for direct-current work made by that company. The storage battery has 288 cells of the 21-G type, manufactured by the Electric Storage Battery Company, Philadelphia, Pa. The cost of the station was $250,000.

The station at the present time is operated by 15 men, excluding the chief engineer. All men work by the hour on a 12-hour basis, each receiving pay in accordance with his position. On each shift of either night or day there are five men—one engineer, one oiler and three firemen. The other five, to make the 15, work all day work, making 10 hours each, on repairs to boilers, loading ashes, handling coal and general labor. The engineer on duty has full charge of the running of the plant and takes orders from no one but the chief engineer. All men change turns, working nights one week and days one week, except the 10-hour men, who work but six days a week, except when called out to do extra work.

The main engines run about 21 hours a day, from 4:15 a. m. to 1:15 a. m., all cars stopping at that time. At other times the power for lighting and similar uses is taken from the storage battery, which is cut on to the main busbar after the last engine stops. By this means we have power on all lines of the system at all times.

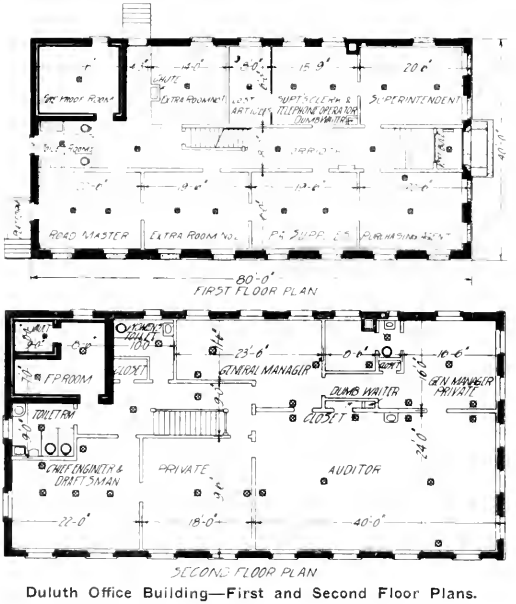
The new stock yards branch of the South Side Elevated Railroad, Chicago, was opened for traffic on Wednesday of this week and approximately 25,000 passengers were carried the first day. The line connects with the main line at Fortieth street and Indiana avenue, and extends to Forty-fourth street and Packer's avenue in the Union Stock Yards, forming a loop almost in the center of the yards. Transfers are issued to the main line. A special car made a special trip over the line on Monday

NEW OFFICE BUILDING OF THE DULUTH STREET RAILWAY.

The Duluth Street Railway Company of Duluth, Minn., has recently completed a new 2-story office building, 40 by 80

Duluth Office Building—Exterior View.

feet in size. A photograph of the new structure is reproduced herewith. The general offices were moved to the new building last month from the power house, where they have been located ever since the company began using electricity as a motive power. The new building is located at the northeast corner of the block containing the company's car house and shops, at the intersection of Twenty-seventh avenue and Superior street.



Duluth Office Building—First and Second Floor Plans.

As will be noted from the engraving the exterior is of an attractive though simple design. The building is constructed of light-colored pressed brick, with stone foundations and trimmings and a sanded galvanized iron cornice. The arrangement of the first and second floors is shown in the accompanying plans.

The basement contains the coal room, ash bin and a storeroom. On the main floor are located the offices of the roadmaster, purchasing agent, superintendent and superintendent's clerk, also a fireproof room, toilet room, two extra rooms and rooms for purchasing agent's supplies and for lost articles. The second floor contains the offices of the general manager, auditor and chief engineer, also toilet rooms and a fireproof room containing a vault.

The building was designed by German & Lignell, architects, of Duluth.

PASSENGER DUPLEX HAT CHECKS.

Through the courtesy of G. C. Pierce, general superintendent East St. Louis & Suburban Railway Company, East St. Louis, Ill., we present an illustration and description of a new duplex hat check and fare receipt designed by him.

The check, each half of which is $1\frac{3}{8}$ by $3\frac{5}{16}$ inches in size, has been found very satisfactory when used with the Ohmer register. Its use also enables the accounting department to segregate the earnings between the different stations and assists the conductor in convincing passengers what the rate of fare is between the different points. In case of a complaint a passenger is provided with a receipt that he can present to the general office to establish the fact that he was a passenger on a certain car at a certain time and had paid for transportation between points named on the duplicate half of his check. The check also prevents passengers from riding beyond the point to which they had paid, and it assists the conductor in detecting passengers that have boarded the car when it is crowded.

Duplex Hat Check.

Ten minutes before the Alton car leaves East St. Louis the conductor collects his fares and issues hat checks. Therefore he is able to leave East St. Louis with his fares all registered and he also is able to give his undivided attention to rules and regulations pertaining to the operation of an interurban line, and, moreover, he can then assist passengers in leaving and boarding the car. Each conductor is provided with a different colored hat check, and as their hat checks are printed in numerical order a passenger cannot leave one car and return on another, claiming a right to ride on his hat check, which he might have retained from the first conductor.

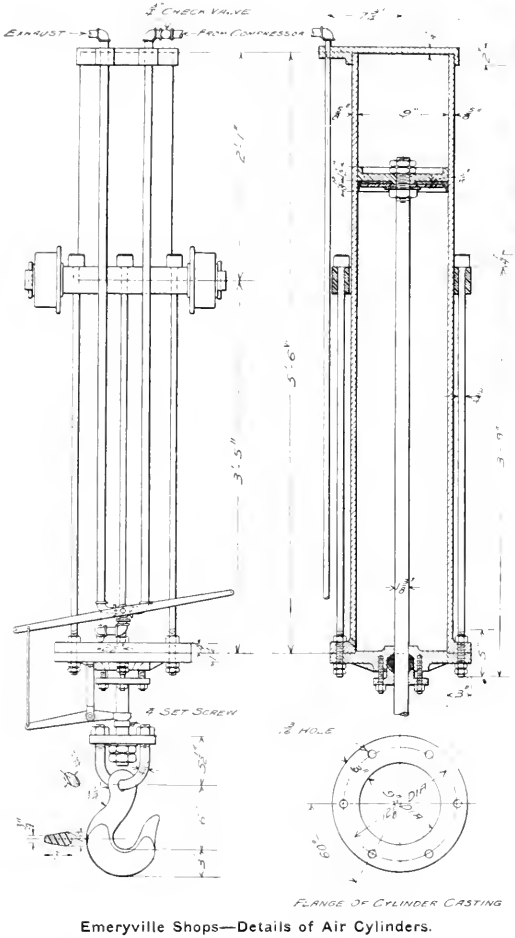
Mr. Pierce advises that there has been no copyright issued, therefore any company is at liberty to use this check. The copyright was applied for, but later on the request was made to cancel the application.

Proposed Electrification at Boston.

Vice-President T. E. Byrnes of the New York New Haven & Hartford Railroad stated in an address before the Boston Produce Exchange on April 7 that if the proposed merger of the New Haven road and the Boston & Maine Railroad becomes effective, there is no doubt that inside the next five years the entire suburban train service of the two companies within 20 miles of Boston will be electrified. The electric service at the New York terminal has been successful and the next logical development is in connection with the Boston service.

AIR LIFT JIB CRANES AT OAKLAND.

In the Emeryville shops of the Key Route and the Oakland Traction Company considerable use is made of jib cranes of the type illustrated by the accompanying engravings. These cranes are installed at the ends of pits in the shops and also near the larger machine tools. Each crane comprises a vertical post of structural shapes supported at the top and bottom by trunnions which assure easy radial movement. The vertical posts carry two channel irons, on which rolls a 2-wheel carriage, supporting an air piston with a stroke of



Emeryville Shops—Details of Air Cylinders.

about five feet. The lifting movement of the air piston is controlled by handles hung at a convenient height above the floor.

One of the acompanying illustrations shows the general dimensions of a complete crane and the other shows the detail construction of the air hoist as it is supported in its carriage. These cranes have a lifting capacity of 4,500 pounds each.

The Massachusetts legislature has adopted a resolution asking the state railroad commission to state whether it would be feasible to equip all of the steam railroads entering Boston with electric locomotives within the city limits.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Passenger May Testify as to Speed.

Goodes v. Lansing & Suburban Traction Company, 114 Northwestern Reporter, 338.—The supreme court of Michigan says that it was contended in this case that it was not competent to receive the opinion of a witness who was a passenger in an electric car as to speed, but the court holds that the testimony was properly received.

Use of Work Car Without Step—Alighting from Moving Car Where Snow is Banked.

Flynn v. Connecticut Valley Street Railway Company, 82 Northeastern Reporter, 1085.—The supreme judicial court of Massachusetts says that an assistant superintendent, while in the act of alighting, fell from a work car from which a step had been removed. It was this which caused the accident. There was evidence tending to show that he had called the attention of the superintendent to the absence of the step, and that the superintendent had promised to have it repaired immediately. How far he was justified in relying on the promise of the superintendent to have the step repaired, and how far, taking all the circumstances into account, the risk was to be regarded as an obvious one, and as having been assumed by him were questions especially within the province of the jury, as was also the question whether, in the exercise of due care, he should have looked, if he did not, before attempting to alight, and whether, if he had looked, he could have failed to see there was no step there.

Moreover, the court holds that it could not be ruled as matter of law, as the defendant in effect asked the court to rule, that the plaintiff was negligent not only in attempting to get off the car while in motion but also in attempting to alight while the car was in motion at a place where the road was banked with snow. It was not, as matter of law, necessarily negligent for him to attempt to alight while the car was in motion. Whether he was negligent in attempting to alight as he did at the place where he did was a question for the jury.

Transfers Cannot be Limited to One Direction When Statute Authorizes Trip Between Any Two Points.

Wells v. New York City Railway Company, 107 New York Supplement, 430.—The supreme court of New York, appellate division, second department, says that this action was for the statute penalty of $50 prescribed by Section 104 of the New York railroad law, for refusing a transfer to a passenger. The plaintiff was at the corner of Lexington avenue and One Hundred and Second street, Manhattan borough, and wanted to go to the corner of Columbus avenue and Ninety-third street. These two points are on opposite sides of Central park, the one on the east and the other on the west side. He took a car on Lexington avenue going north, and on paying his fare asked for a transfer ticket that would take him to the said point he was going to. The conductor said he could not give it to him, but gave him a transfer ticket to go west on the cars on One Hundred and Sixteenth street to Columbus avenue. The plaintiff took a car west on that street, and on giving the conductor the transfer ticket for his fare asked him for a transfer ticket south on a Columbus avenue car to his said place of destination, viz., the corner of the said avenue and Ninety-third street, but it was refused him. He took a Columbus avenue car south, and was obliged to pay another fare. The defendant claimed that, as the plaintiff started north at the beginning, he was not entitled to a transfer ticket to go south at any stage of his journey—that the transfers must all be in the same general direction as the start—and that, while he could have had a transfer north on Columbus avenue, he was not entitled to one south. There is no such limitation in the statute. The plaintiff could not get from his starting point to his destination except by going as he did north, then west, then south by Columbus avenue, unless he first went south, then west by Fifty-ninth street, then north by Columbus avenue. Either of these was his direct way to get from the one point to the other. The statute requires a village or city street railroad company to carry a passenger on a continuous trip "between any two points" on its road, or any connecting roads or lines operated or controlled by it, for one fare, and to give a transfer to the passenger entitling him to make the trip. That means across town as well as through town.

Line of Danger—Duty of Motorman Begins When Child Leaves Sidewalk and Starts for Track.

Cornovski v. St. Louis Transit Company, 106 Southwestern Reporter, 51.—The supreme court of Missouri, division No. 1, says that an instruction predicating liability on the fact that the motorman saw, or by keeping a vigilant watch would have seen, the plaintiff's child, Esther, crossing the street, and in position of danger of being struck by said car, etc., was claimed to be erroneous because it assumed the child was in a position of danger the moment she started across the street, instead of leaving that question to the jury to determine as a fact.

If Esther had been an adult in the possession of mature judgment, or had passed the years of infancy, and was arriving at years of judgment and sense, then, unless the motorman saw she was bent on crossing the track and was oblivious to her danger, it would have been error to have assumed that she was in danger from the very time she left the curb until she reached the track. Where the danger line would lie (with reference to the running of street cars) for an adult, or for one possessed of some years and some discretion, in crossing the street might very well be a matter of difference between good average men, and therefore a question for the jury.

However, in the case of a 4-year-old child, it is axiomatic that as soon as she left the sidewalk and headed across the crowded street she was in danger. The finding of a jury on that question would not instruct any court or subserve any purpose of the law and the assumption that the child was in danger the moment she left the curb was correct.

Care Required of Passenger Given Right to Ride on Inner Running Board.

Simonton v. St. Louis Transit Company, 106 Southwestern Reporter, 46.—The supreme court of Missouri, division No. 2, says that the plaintiff alleged that, the car being crowded, he was invited to ride, and did ride, on the running board, and that while he was thus riding he was struck and knocked from the car. An instruction was given the jury that it was the duty of the plaintiff, in going upon the inner foot board of the car upon which he entered, to exercise such degree of care as the position he was in rendered reasonably necessary to prevent his being struck by passengers on the car or by the car passing on the other track; and that if the jury believed from the evidence that the plaintiff, while upon such running or foot board, could, by standing upright thereon, and not leaning outwardly toward the cars on the other track, have avoided being struck by a passenger on or by the passing car, and that he failed to maintain such upright position and in consequence of such failure was struck and injured, then the plaintiff was not entitled to recover, and the verdict must be for the defendant. There was no error in this. While it might be said, upon the facts disclosed by the record, that the plaintiff had the right to ride upon the inner board of the defendant's car, yet it was equally clear that his position in so riding was attended with danger of being hurt. Therefore, in the court's opinion, it was very appropriate under the circumstances to direct the attention of the jury to the necessity of the plaintiff exercising due care and caution to avoid injury.

News of the Week

Detroit 3-Cent Fare Ordinance Enjoined.

Judge Swan of the United States district court on April 6 made permanent an injunction restraining the city of Detroit from enforcing the Hally ordinance, which would have compelled the Detroit United Railway to operate its cars on streets on which franchise rights have expired under regulations which provide for the sale of five tickets for 15 cents, universal transfers and the payment of taxes on an ad valorem basis. The injunction was obtained by the Fidelity & Guaranty Company of New York.

Accident on the Aurora Elgin & Chicago Railroad.

A westbound car of the Aurora Elgin & Chicago Railroad struck a carriage at a crossing near Maywood, Ill., on Wednesday afternoon, killing the four women occupants of the carriage and injuring the driver so that he died a few hours later. The carriage was completely demolished and the bodies of its occupants were ground beneath the wheels of the car and carried for a considerable distance. The motorman was seriously injured. The crossing is near a sharp curve of the tracks, but is so located that the view was unobstructed. The car was moving about 50 miles an hour and was about 500 feet from the crossing when the motorman saw the carriage. He slowed down and sounded the whistle. The driver stopped, but evidently changed his mind, as he started again to cross in front of the car. It was then too late to stop the car and it ran for 200 feet beyond the crossing before it could be brought to a standstill.

Work of the New York Public Service Commission.

The New York public service commission of the first district has issued a review of its work up to the present time. In addition to perfecting the plans of the Fourth avenue subway and laying out the route of the Broadway-Lexington avenue route, it has modified the plans for the Manhattan end of the Brooklyn subway loop, which is to connect the Brooklyn, Williamsburg and Manhattan bridges by a 4-track subway, so that trains coming from Brooklyn may pass through this loop and back over another bridge without switching on the Manhattan side. In the plans for all future subways provision has been made so that ordinary railroad coaches may be operated through them by increasing the height one foot. In regard to the Interborough-Metropolitan investigation which was conducted last fall the commission says: "The heavy load of overcapitalization under which the surface car system labored was discovered and defined. It is the belief of those competent to judge that the final result will be a general reorganization of these lines and the placing of many of them upon a solid financial basis, whereby it will be possible to operate them at a profit and give the public adequate service. Since the investigation was suspended last fall the commission has energetically gone into the work of inspecting the car lines and their equipment, with the result that orders have been issued for the practical overhauling and thorough repair of all surface cars operated in Manhattan, Brooklyn and the Bronx. The companies have accepted these orders and the work of repair has been under way for several months. The consequence will be that when open cars are put into service on the first of May, or thereabouts, the citizens of New York for the first time in many years will have the privilege of riding upon cars as good as new." The commission has also issued a report entitled "The History of State Regulation in New York," which reviews the history of the various railroad and rapid transit commissions in the state since 1855 and of the legislation leading up to the present development of the transportation facilities of New York City.

Transit Affairs in New York.

The New York public service commission, at its meeting on April 2, passed a resolution instructing the chief engineer, Henry W. Seaman, to prepare detailed plans and specifications for the Broadway-Lexington avenue subway route, a map and description of which were published in the Electric Railway Review of January 4, page 19. The route has already been approved by the board of estimate and it is expected to have the plans ready for final approval by July 1. At that time the city's borrowing capacity will be increased by about $50,000,000 and it is hoped that contracts may be awarded this year for the first sections of the work at least.

On the following day Commissioner Bassett presented a resolution advocating the construction of the Broadway portion of the Brooklyn subway loop before taking up the Broadway-Lexington route, in order to hasten the relief of the congestion at the Brooklyn bridge by developing the transportation facilities of the Williamsburg bridge. The plan did not meet with favor and was referred to a committee of the whole.

On April 3 the board of estimate passed a resolution calling upon the public service commission to submit detailed plans for the Broadway-Lexington route within 60 days. The mayor and the comptroller opposed any action which might tend to commit the city to a plan for which money was available, but the board decided to put itself on record as favoring the proposed route. The present plan is to secure final approval of the subway plans and secure bids as soon as possible in order that the question of the city's ability to build the subways may be definitely determined when the contracts are submitted to Comptroller Metz for approval.

At a hearing before the commission on April 2 in regard to complaints that the Westchester electric railway companies impose a hardship on their employes through failure to provide closed vestibules on their cars, L. F. Crumb, counsel to the receiver of the Yonkers Railroad, stated that his company was financially unable to obey an order to equip its cars with vestibules. He said that the receipts at the present time were hardly more than the operating expenses.

The public service commission on Monday of this week began advertising for bids for the construction of the Brooklyn Fourth avenue subway, for which the forms of contract were approved by the board of estimate on March 26. Bids are to be received by May 8 and awards will probably be made within 20 days from that date. The route extends from the Brooklyn terminal of the Manhattan bridge to Fourth avenue and Forty-third street, Brooklyn, and is divided into six sections. Bids are to be received by sections. The estimated cost of the six sections is $15,000,000 and it is probable that the city will not be able to undertake more than one or two sections this year.

Fail to Reach Settlement in Cleveland.

The negotiations between the Cleveland Electric Railway and the city authorities of Cleveland looking to a settlement of the 7-year controversy under a plan which included a lease of the Cleveland Electric Railway and the Forest City Railway were broken off, temporarily at least, on Tuesday of this week. The arbitrators failed to agree on the value of the stock of the Cleveland Electric Railway. F. H. Goff, representing this company, refused the offer of Mayor Tom L. Johnson of $50 a share for the stock and submitted a claim for $61.75 a share, which did not include any allowance for good will. The mayor's offer was based on a valuation of approximately $15,000,000 for the physical property, $4,000,000 for franchise value and $2,000,000 for good will. From this amount a little over $9,000,000 was to be deducted for the payment of indebtedness. There are 234,000 shares outstanding. Mr. Goff's total was over $23,000,000, and included a larger estimate than the mayor was willing to allow for overhead charges, financing and value of outside franchises.

Mr. Goff's decision to reject the offer was submitted to the directors of the Cleveland Electric Railway at a meeting on Wednesday and his action was unanimously approved.

Before discussion of the final valuation nearly all of the other details of the settlement were agreed upon. It had been decided that the Cleveland Electric Railway should increase its capital stock $1,805,000 for the purpose of acquiring the Forest City Railway, and the form of the lease of the two properties under the name of the Cleveland Railway Company to the Municipal Traction Company, and the security grant to the Cleveland Railway Company had been agreed upon.

The drafts of the security franchise and the lease were made last week and the security franchise was submitted to the city council on April 6. The ordinance renews for 25 years all existing franchises owned by the Cleveland Electric Railway in return for a surrender of the present franchises. The downtown section is to be made free territory and the city reserves the right to grant joint use of tracks to any other company. The cash fare is to be five cents and six tickets are to be sold for 25 cents. The city reserves the right to purchase the property at the end of the franchise period at a price to be agreed upon by the city and company or by a board of arbitration. This price shall represent the cost of reproduction of all the physical property, less a reasonable amount for depreciation. If, at the expiration of the grant, the city does not renew it or purchase the property the franchise may be granted on the same terms to another company. In case the company fails to comply with the conditions of the grant it shall forfeit all rights and privileges contained therein. The right to regulate the service is reserved to the city council.

The form of the proposed lease of the Cleveland Railway to the Municipal Traction Company provides for a lease for 50 years at a rental of 6 per cent. The holding company

binds itself to pay the just obligations of the Cleveland Railway, to carry out the contracts of that company, and to maintain the property within 70 per cent of its reproduction value. For this purpose the company must lay aside the first year 5 cents per car-mile, the second year 5¼ cents and for each succeeding year 5½ cents. The holding company agrees to take no lease of any other company without the consent of the Cleveland Railway and also agrees to seek franchises to keep up with the development of traffic. The Cleveland Railway is required to issue $15,000,000 of stock for improvements at the request of the holding company.

The right is reserved to the city to purchase or lease the property at the expiration of the lease if it has the power at that time. The purchase price in such case is to be 10 per cent above the valuation of the property, less depreciation. Provisions for a forfeiture of the lease were purposely made loose. In case the Cleveland Railway fails to have the security franchise renewed every 10 years the lease is to be forfeited. The lease may also be forfeited in case the holding company fails to pay interest on bonds, or fails for eight months to pay the rental.

No fixed rate of fare is specified in the lease. The rate is to be as low as possible to provide for a return of 6 per cent on the value of the property. Mayor Johnson explained to the city council that it was proposed to lower the fare gradually and that a 3-cent fare would not be put into effect for 60 or 90 days. The plan was to charge a 3-cent cash fare for the first 30 days and charge one cent for transfers; then to charge 3⅓ cents fare with free transfers. In this way statistics might be obtained on the relation of fares and transfer privileges to traffic.

Legislation Affecting Electric Railways.

Ohio.—The house on April 7 passed the Schmidt bill, which had already passed the senate. The bill provides that franchises on streets occupied by street railways may be granted to new companies or renewed upon the expiration of the original franchises without the necessity of securing new consents of property owners. As amended by the house the bill provides that the action of city councils on franchises shall be referred to a referendum vote upon application of 15 per cent of the qualified voters, and must be approved by a majority of the voters to become effective. Another amendment requires the consents of property owners for an extension of tracks.—The Stockwell bill, which authorized municipalities to build street railways to be leased to operating companies, has been defeated by the house.—The house and senate have both passed a bill introduced by Mr. Lamb, which permits interurban railroads to appropriate the use of city tracks to reach a terminal. In the event of a dispute as to the amount of compensation the courts may be asked to settle the question.

New York.—The senate cities committee has reported the Travis-Robinson subway franchise bill with an amendment increasing from 25 to 50 years the period in which a company may operate a subway under an indeterminate franchise before the city may have the right to purchase the property. Another amendment increases the term for which a subway built by the city may be leased by an operating company from 25 to 35 years.

Accident on the South Side Elevated Railroad.

A peculiar accident occurred on Tuesday morning of this week on the South Side Elevated Railroad, Chicago, when the first car of a 3-car train was derailed and fell from the elevated structure to the ground. The car contained about 17 men, including the crew, all of whom were more or less injured, but no one appears to have been permanently injured and there were no fatalities. The accident was caused by the motor, which dropped under the front truck of the first car and lifted it from the track.

The train was a Jackson Park local, southbound, consisting of three cars. The accident occurred about 7:30 in the morning and most of the passengers were laborers on their way to work in the southern part of the city, 15 of them riding in the first car, the smoker. About 300 feet south of the Forty-third street station the motor on the front axle of the smoker fell to the track in such a position as to lift the car from the rails with the wheels clear of the guard timbers. The motorman felt his car being raised and immediately applied the air brakes and shut off the current. The train was moving rapidly, however, and the car toppled over to the ground, landing almost perpendicularly. The rear end remained on the structure, which is about 20 feet high. The connections with the second car were broken, but as the first car swung around it pushed the end of the second car over and derailed the front wheels of the leading truck. The end of the second car was only slightly damaged. The front truck of the first car remained attached to the car and fell with it to the ground; the rear truck became detached and struck the ground at some distance away. The passengers were hurled into the forward end of the car as it struck the ground and those who were not injured by the fall were cut and bruised by glass and wreckage. The motorman fell half way through the window but escaped serious injury.

Charles V. Weston, president of the company, said that there was no defect in the rails or the guard timbers and that the accident was entirely due to the falling of a motor. It is probable that a bolt in an axle bearing cap broke and allowed the motor to fall. The car had been thoroughly overhauled within a month and had been inspected three times since, the last time only two days before the accident.

It seems especially unfortunate that so serious an accident should have occurred on the day set for the opening of the stock yards extension, which marks the completion of an extensive series of improvements extending over five years. During this period the Englewood, Kenwood and stock yards extensions have been built. The structure has been largely rebuilt and a third track for express service has been added between Twelfth and Forty-third streets. During all this work, which was carried on without interruption of traffic, no serious accidents of any kind have occurred.

Boston Transit Commission Reports.—The Boston transit commission has issued in one volume it twelfth and thirteenth annual reports, covering, respectively, the fiscal years ending June 30, 1906, and June 30, 1907.

Time for Replies to Accounting Circular Extended.—Prof. Henry C. Adams, in charge of statistics and accounts of the interstate commerce commission, has extended until May 5 the time for replies to Accounting Series Circular No. 20. The original date fixed was March 28.

Michigan Electric Association.—The annual meeting of the Michigan Electric Association will be held in Grand Rapids, Mich., on August 18, 19, 20 and 21. Announcement as to headquarters, programme, etc., will be made at an early date. H. W. Hillman of Grand Rapids is president of the association and A. C. Marshall of Port Huron is secretary.

American Street and Interurban Railway Association Circular.—The American Street and Interurban Railway Association has issued a circular giving statistical information regarding the rates of wages paid to miscellaneous classes of employes by street and interurban roads. Information of this character will be sent annually hereafter to member companies. The circular supplements the previous circular, which gave statistical information in relation to the wages of trainmen.

New York State Convention.—Attention is being called by J. H. Pardee, secretary of the Street Railway Association of the State of New York, 611 West One Hundred and Thirty-seventh street, New York, to the twenty-sixth annual convention, which will be held at the Clifton hotel, Niagara Falls, Ont., on June 30 and July 1, 1908. The detailed programme has not yet been announced. The Clifton hotel has been reserved for convention guests and reservations can be made at any time by applying to T. W. Wilson, manager International Traction Company, Buffalo, president of the association.

Fire at the Sullivan Square Terminal of the Boston Elevated.—A fire which damaged the offices of the Boston Elevated Railway Company's elevated division to the extent of about $5,000 occurred at the Sullivan square terminal station at 1:30 a. m., April 3. The general office of the superintendent of the elevated division suffered most from the flames. After the fire it was necessary to move the telephone switchboard and train dispatcher's office into the trainmen's school room. Rapid work was done in the temporary wiring of the telephone and telegraph services. When the train service began about 5:30 a. m. no delay was experienced in the handling of traffic.

Wage Controversy in Pittsburg.—The controversy between the Pittsburg Railways Company and its conductors and motormen in regard to the question of wages has been submitted to an arbitration committee. A proposal of the company to reduce the wage scale three cents an hour on April 1 met with a threat to strike, but after several conferences it was agreed to continue the old scale until April 8. On Saturday, April 4, it was decided to appoint an arbitration committee, consisting of one member selected by the men, another selected by the company and a third chosen by the first two. George W. Guthrie, mayor of Pittsburg, has been selected to represent the men. The decision of the committee, which is to be binding for one year, is to be reported before April 20 if possible. The present scale is 25, 26 and 27 cents per hour, according to length of service. It is stated that the company's earnings have been greatly reduced during the past few months.

Traffic and Transportation

Costly Transfer System in Brooklyn.

In an interview published in the New York Times on April 6 J. F. Calderwood, vice-president and general manager of the Brooklyn Rapid Transit Company, discussed the abuse of the transfer system on the surface lines of that company, saying in part:

"The number of transfers issued by the various companies, especially the traction companies of the larger cities, and more especially in Greater New York, where the issuance of transfers is governed by laws which were enacted when those controlling the companies did not realize the effect of transfers as they have since developed in reducing the gross revenue per passenger to a dangerous limitation, has increased to an alarming degree.

"The constant increase per passenger in the cost of operation, due not only to the cost of operating, labor and material, but to great outlays required for modifications in construction, due to changing conditions of operation and the replacement of apparatus, the expense of which cannot be capitalized, but must be paid out of earnings, is bringing each day our gross earnings per passenger nearer to the cost per passenger, reducing the margin applicable to fixed charges, interest and taxes, without any consideration of dividends for stockholders. The question of capital stock or dividends is not a factor in any of these computations.

"With a constant decrease in the gross revenue per passenger and an increase in the cost of operation, with the increasing burden of taxation, and let me say right here that it takes the gross earnings each day of 150,000 passengers to pay the taxes of this company alone, it is a grave question with the corporations where they are going to secure the necessary capital to develop and increase the traction facilities.

"Answering your inquiry as to how our figures on transfers, passengers carried, and gross revenue per passenger compare with the memorandum submitted by General Manager Root under the receivers of the New York City Railway to Judge Lacombe, I submit the following interesting comparisons:

New York City (Surface System).

	1906.	1907.
Revenue passengers	391,354,877	376,629,571
Transfer passengers	178,639,866	194,765,342
Per cent transfer passengers to revenue passengers	45.6	51.7
Gross average fare in cents	3.43	3.29

Brooklyn Rapid Transit (Surface System).

	1906.	1907.
Revenue passengers	230,228,994	228,524,961
Transfer passengers	91,621,479	127,032,395
Per cent transfer passengers to revenue passengers	39.8	55.6
Gross average fare in cents	3.56	3.17

"I have not the cost per passenger including taxes and interest, separated for our surface system, but for our entire system (including elevated) it averages for the fiscal year 1906 3.13 cents, and for 1907 3.30 cents per passenger carried. As it costs less to carry passengers on our elevated system, it follows that if we separated the cost of our elevated from the surface the cost per passenger for our surface alone would be an increase on the above figures.

"Taking these figures of gross earnings and cost per passenger it shows that we lost money on every passenger carried on our surface cars for the fiscal years 1906 and 1907, and that the little surplus shown by our annual report was due to our elevated operation, where the transfers are limited."

Indiana Union Traction Magazine.

The Indiana Union Traction Company of Anderson, Ind., has started the publication of a monthly magazine. In the April number, just issued, E. C. Van Valkenburgh, the editor and manager, states that the purpose is to tell about the attractive features of the service on the lines of the company and its connections and of the many beautiful places and points of interest that are easily accessible in Indiana and the adjoining states. The magazine is "for those who use, or who should use, the interurban lines for business or pleasure purposes." The issue contains articles descriptive of the semaphore control system of the Telegraph Signal Company of Rochester, N. Y., which is used on the Indiana Union Traction lines; of the new shops of the company at Anderson, and of Ft. Benjamin Harrison. There are also a short story, a synopsis of "events of the month" at the principal places reached by the road, including the theatrical attractions, and numerous short articles of interest. A map shows the territory covered by the company and its principal connections, and there are given with the timetables the points of connection with other electric railways and with steam roads.

Express Company Arrangement.—The United States Express Company will handle express over the line of the Cleveland Southwestern & Columbus Railway of Cleveland, O., between Bucyrus and Mansfield.

Time Limit on Transfers Reduced.—Instead of allowing, as heretofore, the use of transfers for 30 minutes after the time punched the Utah Light & Railway Company of Salt Lake City has reduced the time limit to 15 minutes.

Fruit Growers' Special Run by Inland Empire System.—What is said to be the first fruit growers' special demonstration train ever run by a steam or electric railroad was operated over the suburban lines of the Inland Empire System, Spokane, Wash., on March 26, 27 and 28. The object in sending out the train was to interest residents on the lines in fruit growing, in fighting the Codlin moth and San Jose scale and to instruct them in pruning and cultivating their orchards in order to achieve the highest efficiency in bearing. The train consisted of a private buffet car and a parlor car. On the observation platform of the latter car pumping and spraying apparatus was installed for the practical demonstrations at each stop. Lectures were given on the following subjects: "How to Make the Orchard Bear," "How to Save the Orchard," "How to Make the Orchard Pay," "How to Ship the Best," "How to Can the Rest," "Fighting Plant Diseases." The schedule included 22 stops of 20 minutes to one hour and a half, according to the size of the town.

FAILURES OF REINFORCED CONCRETE.

H. F. Porter discusses "Failures of Reinforced Concrete" in the Cornell Civil Engineer for December, 1907, with especial reference to the failure of a building of the Eastman Kodak Company at Rochester, N. Y., in 1906. He draws the following conclusions:

(1) The designs for reinforced concrete construction should be carefully prepared by competent, experienced engineers and preferably by engineers whose sole interest is to design a stable structure at as reasonable expenditure as good judgment dictates—in other words, to avoid the pitfalls that have evidenced themselves in the designs of structures that have failed, the engineering and commercial elements should be separated.

(2) Patent trussed bars, while they may be very efficient reinforcing for beams and floor slabs, as certainly attested by the multitude of excellent installations throughout the land, are only so when used by men with a full knowledge of conditions and their installation made by experts, "exercising care in handling the details and giving proper attention to the requirements of the design."

(3) The so-called hollow tile floor system is safe only under the most careful supervision of experienced men, as brought out in a preceding paragraph.

(4) The utmost care must be given to the inspection of materials, and in mixing the preponderance of the fallible human element should be diminished by the universal adoption of machine mixers that automatically and unfailingly mingle just the proper amount of ingredients.

(5) As to the centers—a daily record should be kept of every section of concrete poured, and, as is done abroad, test pieces should be molded to one side to correspond with each section. Accurate knowledge could then be had at any time as to the exact condition of the concrete and the centers removed at exactly the proper time.

(6) Finally, governmental action should be taken to secure the universal adoption of the foregoing recommendations or such other and additional ones as may be found necessary. Uniformity of stress limits and principles of design and suitable attention to the requirements of the disrupting forces existent over the supports should also be included. The building codes are all offenders of the last requirement, many ignoring completely the negative bending moment that must occur with a monolithic construction. Both the Hotel Bixby and the Kodak building failures showed plainly the result of not providing for these strains.

If these suggestions are heeded with ordinary sincerity, there is no reason why the particular system indited, or any other on a scientific basis, should not give entire satisfaction. Beyond cavil reinforced concrete construction if properly executed is the safest, strongest, most resisting and enduring, and at the same time all factors considered the most economical structural material at the command of modern builders.

Construction News

FRANCHISES.

Corpus Christi, Tex.—A franchise for an electric railway in Corpus Christi has been applied for by George H. Paul and F. B. Bannister, representing a company which proposes to build and have in operation five miles of street railway in the city within two years.

Dallas Tex.—An order has been filed with the clerk of the county commissioner's court which provides for the granting of a franchise to A. F. Slater of West Dallas, W. L. Spence, Frank Ford and others to build and operate an electric railway between Dallas and West Dallas, beginning at the foot of the Commerce street bridge and the limits of Dallas and continuing over the West Dallas Pike to West Dallas. It is stated that citizens of West Dallas will be asked to subscribe $50,000 of stock.

Harrisburg, Pa.—The Central Pennsylvania Traction Company, Harrisburg, Pa., has secured a franchise to build extensions in East and West Harrisburg.

Logansport, Ind.—John H. Keller, representing the Indianapolis & South Bend Traction Company, has applied for a franchise. It is stated that construction work will be started south of the city as soon as the franchise is granted.

Monongahela, Pa.—A franchise has been granted to the Monongahela & Carroll Street Railway for the operation of its line in Park avenue and to the city limits of Monongahela. Work is to be started in six months. The road will be extended later to Washington, Pa. George Hosack, president, Pittsburg, Pa.

Nashville, Tenn.—The Nashville Railway & Light Company, which expects to build a 5-mile extension to the national cemetery, will apply to the county court at its April meeting for right of way on the Gallatin turnpike.

Newburg, Ind.—The Evansville Terminal Railway Company, Evansville, Ind., has applied for a franchise to enter Newburg with its new interurban line. M. S. Sonntag, Evansville, Ind., is interested. (Noted April 4.)

New Iberia, La.—The Bayou Teche Railway & Light Company, which was organized to build an electric railway in New Iberia and from New Iberia to Jeannette, La., will apply to the city council for an extension of time in which to start work on the line.

Richmond, Cal.—A franchise for the operation of a street railway in Richmond has been granted to John H. Nicoll.

Salt Lake City, Utah.—The Utah Light & Railway Company has been granted a franchise to double-track its Ashton avenue, the penitentiary and Wandamere lines after the city limits are passed. It is stated that work will be started at once on the Wandamere line in order to care for the summer travel to this resort.

Weston, Ore.—The Idaho Oregon & Washington Traction Company is said to be securing right of way up Pine Creek to Weston, Ore. Application for a franchise to operate its proposed line in that city will be made to the city council on April 15.

RECENT INCORPORATIONS.

Elgin Woodstock & Lake Geneva Railroad.—Incorporated in Illinois to build a railroad from Elgin to a point at the center of the north line of Richmond township, McHenry county, Illinois, with principal offices at Elgin. Capital stock, $25,000. Incorporators: G. W. Young, Algoma, Wis.; Frank R. Spear, George H. Bryant, William C. Hascall, Chicago; John A. Kirkland, Elgin, Ill.

Hudson & Long Island Traction Company.—Incorporated in New York to operate a street railway from Twelfth avenue and West Forty-second street, New York City, across the Blackwell's island bridge, to Long Island City and Jamaica on Long Island.—Incorporators: Frederick H. Morris, 2027 Seventh avenue, New York City; William B. Spencer, Montclair, N. J.; Anthony Stumf, 22 Pine street; Arthur C. Hume, 34 East Thirty-second street; Harold B. Weaver, 18 Gramercy park; Cassius M. Wicker, 35 Nassau street; Henry A. Belden, 3810 Broadway; William V. Lomax, 540 West One Hundred and Forty-third street; John J. Clancy, 353 West Fifty-seventh street, New York City.

Interlake Railroad, Chicago, Ill.—Incorporated in Illinois to build an electric railway from a point on Lake Michigan to Fox lake in Lake county, Illinois. Capital stock, $5,000. Incorporators: A. F. Struckman of the Colonial Trust & Savings Bank, Chicago, Otto Hopper, S. N. Conway, Martin D. Smith and S. S. Welcher.

Oklahoma City & Shawnee Interurban Railway.—Incorporated in Oklahoma to construct an electric line between Oklahoma City and Shawnee, Okla. Capital stock, $3,000,000. Incorporators: A. M. Spencer, Stephen Brown, Joseph Brown and J. A. Stevenson, all of Oklahoma City.

Potomac Valley Railway.—Incorporated in Maryland to build a railroad from Keyser to Bloomington, Md., passing through Mineral and Garrett counties. Principal office, Piedmont, Md. Capital stock, $150,000. Incorporators: Louis P. Trabe, Joseph J. Benton, Charles A. Geiger, C. M. Burkett and Anton Korn, all of Wheeling, W. Va.

Washington Patuxent & Drum Point Railroad.—A bill has been introduced in the Maryland legislature incorporating this company to build a railway, either steam or electric, from a point on the Chesapeake Beach Railway to Solomon's island at the mouth of the Patuxent river, passing through Calvert, Prince George and Arundel counties. Capital stock, $250,000. Incorporators: Ira J. Baker and Charles C. Mayer of Washington; C. A. M. Wells, Joseph R. Owens, Rexford M. Smith, Wallace A. Bartlett and Charles A. Wells.

TRACK AND ROADWAY.

Boston Elevated Railway.—The committee on street railways of the Massachusetts legislature has voted to report favorably the bill to allow the Boston Elevated Railway to extend its structure from Sullivan square, Charlestown, to Medford square, Medford.

Calgary, Alberta.—Plans are being considered for the construction of an electric railway between Calgary and Shepard, Alberta, with a pleasure park on the borders of Shepard lake. A charter will be applied for shortly, and it is stated that construction work may be begun during the summer.

Chicago City Railway.—Work has been started on the reconstruction with 129-pound rails of the tracks on Twenty-second street, between Cottage Grove and Wabash avenues, and on Wallace street, between Twenty-ninth and Root streets. Plans are also being prepared for an extension on Western avenue, from Thirty-eighth street to the Chicago river.

Chicago Lake Shore & South Bend Railway, South Bend, Ind.—The line between Michigan City and South Bend, Ind., is now completed except for two miles west of Hudson Lake, and it is planned to begin operating over this section early in May. The remainder of the line to Kensington, Ill., is expected to be completed by July 1. J. B. Hanna, president. (Noted February 1.)

Chicago Railways Company.—The Chicago board of supervising engineers has issued a schedule of the construction work to be undertaken during the spring and summer under the company's franchise extension ordinance, showing that 59.55 miles of new track are to be built with 129-pound grooved rails. Of this amount 7.11 miles will be extensions of existing lines and the remainder will be reconstruction.

Cleveland & Indianapolis Interurban Railway, Norwalk, O.—C. F. Jackson states that arrangements have been made to secure 80 per cent of the money to build the road from Norwalk, O., to Bluffton, Ind., provided the remaining 20 per cent can be subscribed in the towns along the line.

Conestoga Traction Company, Lancaster, Pa.—It is reported that the Columbia-Donegal division is to be extended from Marietta to Maytown, Pa. H. W. Crawford, chief engineer.

Dallas, Tex.—A. F. Slater and Frank Ford of West Dallas, Tex., are interested in the construction of a street railway in West Dallas and vicinity. The road will connect West Dallas with the new town of Cement and will parallel the West Dallas pike, crossing the river at the foot of Commerce street. The citizens are asked to subscribe $50,000, a large portion of which is said to have been pledged.

Davenport & Manchester Railway, Davenport, Ia.—At a recent meeting of the directors W. H. Kimball submitted plans and estimates for the proposed line from Davenport to Manchester, Ia., 93 miles. It is expected that arrangements for financing the project will be made shortly.

Denver & Interurban Railway, Denver, Colo.—Construction has been started on the city line in Boulder, Colo., which will be operated in connection with the line form Denver to Boulder. H. W. Cowan, chief engineer. (Noted March 21.)

Diamond State Rapid Transit Company, Smyrna, Del.—It is stated that this company will start construction work on its

proposed 98-mile electric railway within 60 days. The overhead trolley system will be used. The following cities and towns will be served: Wilmington, Newcastle, Delaware City, St. Georges, Odessa, Smyrna, Dover, Camden, Magnolia, Frederica, Milford, Milton, Lewes and Rehoboth. The power station will be located at St. Georges. The National Construction Company, recently incorporated, will build the road. Capital stock, $3,000,000, of which $50,000 has been issued. M. V. Ford, president; S. Derrickson, vice-president; H. Hartman, secretary and treasurer; J. W. Endean, general manager and chief engineer; all of Smyrna, Del.

Ft. Worth Springtown & Mineral Wells Electric Railway, Mineral Wells, Tex.—C. N. Wilson, president of the American Engineering Company, Indianapolis, is quoted as saying that financial arrangements have been made for the construction of the proposed line between Ft. Worth and Mineral Wells, Tex., and that contracts will be let in a few days for the grading. About six miles of grading has already been completed.

Gardiner, Me.—Amos F. Gerald of Fairfield, Me., is interested in a project to build an electric railway from Topsham to Gardiner, Me., 27 miles.

Grand Valley Railway, Brantford, Ont.—It is reported that construction is to begin this spring on the lines from Brantford to Port Dover, Ont., 35 miles, and from Brantford to Woodstock, Ont., 25 miles. W. P. Kellett, chief engineer.

Hazlehurst, Miss.—It is reported that J. W. Abernathy contemplates building an electric railway about 40 miles long, connecting Hazlehurst, Brown's Wells, Barlow and Dentville, Miss.

Interstate Railway.—Smith H. Bracey, 1606 Tribune building, Chicago, president, states that it is proposed to build a double-track electric railroad by the most direct route from St. Joseph to Kansas City, Mo., via Halleck, Dearborn, Platte City and Hampton, 48½ miles. Surveys have been made and a large part of the right of way has been secured. Negotiations are now under way for financing the project and it is hoped to be able to begin preliminary work in the near future. A. T. Russell, Chicago, is chief engineer, and G. R. Collins, Kansas City, is secretary.

Johnstown, Pa.—It is reported that the Cambria Land & Improvement Company is receiving bids for the construction of an electric line from Johnstown to Southmont, a new suburb.

Joplin & Pittsburg Railway, Joplin, Mo.—Construction has been resumed on the line between Joplin, Mo., and Pittsburg, Kan., 30 miles. All of the material has been delivered and four steel bridges are being erected. P. P. Crafts, general manager. (Noted October 12, 1907.)

Joliet & Southern Traction Company, Joliet, Ill.—This company has made financial arrangements for completing from 15 to 20 miles of the extension from New Lenox to Blue Island, Ill., this year, and will do its own construction work. H. A. Fisher, president. (Noted February 29.)

Kansas Traction Company.—This company, which was incorporated about a year ago to build an interurban system of electric lines in Kansas, comprising about 160 miles, has started surveys. The road will connect Kansas City, Kan., with Independence, Coffeyville and Lawrence, with branches to Topeka and other points. F. B. Shirley of Coffeyville is president. Paul Julian is the engineer in charge of surveys. (Noted September 21, 1907.)

Kokomo Frankfort & Terre Haute Traction Company, Frankfort, Ind.—D. W. Bolen, second vice-president, advises that work on this proposed line will be started during the summer. The road will extend from Kokomo to Terre Haute, 104 miles, and will serve the towns of Frankfort, Crawfordsville, Rockville, Rosedale and others. It will parallel the Chicago Cincinnati & Louisville Railroad from Kokomo to Frankfort and from Frankfort to Terre Haute will parallel the Vandalia Railroad. Contracts will be let this spring. Dr. Oliver Gard, president, Frankfort, Ind.; J. C. Deweese, first vice-president, Kokomo; D. W. Bolen, second vice-president, Indianapolis; E. B. Swift, secretary; and M. W. Eikenberry, treasurer, Kokomo; Judge J. V. Kent, general counsel, Frankfort. (Noted February 15.)

Los Angeles & San Francisco Short Line Electric Railroad, Los Angeles, Cal.—This company, recently incorporated, proposes to build an electric railway from Los Angeles to San Francisco, via Bakersfield, Cal. The officers are: President and general manager, John Cross; vice-president, W. F. Haas; treasurer, Charles Wier; secretary, Charles S. Burnell; chief engineer, M. K. Miller.

Louisville & Eastern Railroad, Louisville, Ky.—This company is reported to have let a contract for ballasting its extension from Beechwood to Shelbyville, Ky., to M. J. McClusky. About one-half mile of grading remains to be completed. Percival Moore is vice-president and general manager.

Louisiana Light Power & Traction Company, Louisiana, Mo.—This company proposes to build an electric railway from Louisiana to Bowling Green, Mo., 11 miles. The power station and repair shops are to be located at Louisiana. It is proposed to begin construction this summer. D. Turnbolt, president and general manager, and F. E. Murray, secretary.

Mexico Santa Fe & Perry Traction Company, Mexico, Mo.—This company, which was organized some time ago to build an electric railway from Perry to Mexico, Mo., 27 miles, has filed a mortgage in the Audrain county court for $850,000 to secure gold bonds which will be issued and sold to raise the necessary funds for completing the work. S. L. Robinson, Mexico, Mo., president. (Noted March 14.)

Milner & Northside Electric Railway, Milner, Idaho.—It is reported that this company has let a contract to Grant & Son of Faribault, Minn., for the construction of its proposed line from Milner to Gooding, Idaho. D. C. McWatters, president.

Mt. Hood Railway & Power Company, Portland, Ore.—It is reported that construction will be resumed at once on the line from Portland to Bull Run, Ore., 25 miles. The Mason Construction Company has the contract. Eleven miles of grading were completed last fall. Equipment is now being received for the power plant at Bull Run. F. C. Finkle is chief engineer. (Noted December 14, 1907.)

Mt. McKay & Kakabeka Falls Railway, Ft. William, Ont.—This company, which was recently granted an extension of time in which to complete its proposed line from Ft. William to Kakabeka Falls, Ont., via Neebing, Paiponge and Oliver, has completed about 2½ miles of track. The officers are: President, W. F. Hogarth; vice-president, J. Dyke; treasurer, C. H. Jackson; secretary, C. W. Jarvis; all of Ft. William, Ont. (Noted January 11.)

Muskogee, Okla.—A company has been organized to build an electric railway from Muskogee to Clarksville, Coweta, Broken Arrow and Tulsa, 54 miles.

Nashville (Tenn.) Railway & Light Company.—It is reported that this company is planning to build an extension about five miles long on the Gallatin turnpike to the national cemetery. Surveys have been started for an extension of the St. Cecilia line to the White City.

Okanogan Electric Railway, Spokane, Wash.—A. M. Dewey, president, states that construction work will be started by June 1 on the proposed line from Nighthawk to Brewster, Wash., via Omak and Okanogan, with the intention of completing 20 miles of the line this year. Water power rights on Sinlahekin and Salmon creeks have been filed, which are capable of development to furnish 5,600 horsepower. M. D. Winder is chief engineer. (Noted November 9, 1907.)

Oregon Electric Railway, Portland, Ore.—Surveyors are at work on three separate routes for the extension of this line from Salem to Albany, Ore., 27 miles, and it is announced that construction will be started in about six months. The 21-mile extension to Forest Grove probably will be started within 30 days. With the completion of these extensions by the end of the year the company will have 100 miles of main line in operation. W. S. Barstow & Co., New York City and Portland, Ore., have the contracts for building both extensions. G. W. Talbot, vice-president and general manager. (Noted March 21.)

Oregon Rapid Transit & Power Company, Jacksonville, Ore.—Officers for this company, which was incorporated a few weeks ago, have been elected as follows: F. C. Page, president; F. E. Merrick, treasurer; S. E. Nye, secretary; Capt. F. L. Adams, general manager. The company will build a system of interurban lines serving the entire Rogue river valley from Grant's Pass to Ashland and Jacksonville, Ore. It is stated that power will be obtained from the Condor Water & Power Company, although the company later may secure water rights for the development of 30,000 horsepower. (Noted March 21.)

Ottawa, Ont.—Plans have been prepared for an electric railway from Ottawa in a southerly direction through Carleton, Russell and Dundas counties to Morrisburg, Ont., thence along the river front to Brockville, Iroquois, Cardinal and Prescott. From Prescott it will proceed northerly through Leeds, Lyn and Athens, thence through Perth, Lanark and Renfrew and back to Ottawa, making altogether a complete belt line of about 200 miles. This company is said to be

entirely separate from the two other proposed lines of electric railways between Brockville and Prescott and the Morrisburg Electric Railway.

Pottsville (Pa.) Union Traction Company.—It is reported that this company has decided to build a new bridge over the Philadelphia & Reading tracks in Pottsville to replace the present one, which has been found unsafe.

Prosser (Wash.) Traction Company.—Frederick Finn, president, writes that it is proposed to build an electric railway south from Prosser, with branches to Bickleton and Patterson, Wash., 40 miles. Surveys are now being made from Prosser to Bickleton, 26 miles, and grading is to be started some time this summer. A contract is to be let soon for a dam and a power house. Frank O. Kelsey of Portland, Ore., is chief engineer. (Noted January 25.)

Redlands Central Railway, Redlands, Cal.—John H. Fisher, vice-president and general manager, writes that this company's line will extend from Redlands to Riverside, Cal., 12 miles. Surveys have been completed for three miles and grading is to be started in 60 days. The Ohio Brass Company's overhead construction will be used. A. G. Hubbard, president. (Noted February 8.)

Roanoke (Va.) Railway & Electric Company.—It is reported that this company will build an extension to West Salem.

Rochester Corning & Elmira Traction Company, Rochester, N. Y.—The New York public service commission of the second district has authorized this company to issue its outstanding capital stock to the amount of $3,880,000 and to issue $4,210,000 of 35-year 5 per cent bonds for the purpose of building its proposed line from Rochester to Elmira, a distance of 138 miles. The total capital stock is $4,000,000. It is announced that construction is to be resumed about May 1. The Rochester & Southern Construction Company, Rochester, N. Y., has the general contract for building the line and several miles of grading between Scottsburg and Conesus Lake were completed last fall. The entire route has been surveyed and subcontracts for a part of the grading have been let. It is proposed to adopt the single-phase system. W. C. Gray, chief engineer. (Noted November 30, 1907.)

Salem, Ore.—The Salem board of trade has appointed a committee to ascertain the cost and investigate the feasibility of constructing an electric railway from Salem to Stayton, Ore., 15 miles.

South Memphis Traction & Electric Company, Memphis, Tenn.—This company is being organized to build an electric railway from Memphis to South Memphis.

Taylor, Tex.—A number of business men of this city, including J. A. Thompson and Howard Bland, are interested in a plan to build an electric railway from Taylor to Austin, Tex., via Pflugerville, with a belt line in Taylor. At a meeting held on April 1 C. P. Scrivener, representing the Texas Interurban Company, presented estimates and made a proposition to build the line for a cash bonus or for donations of land for right of way, terminals, etc.

United Railways, Portland, Ore.—Considerable progress is reported on the construction work now under way by this company. Two surveys have been made on its proposed Hillsboro extension as far as Mt. Calvary, about four miles from the city limits of Portland, and it is stated that work will be started with the expectation of having the Hillsboro line completed to Mt. Calvary during the summer. Right of way has been secured for most of the distance. The company also expects to start work on the double-tracking of Stark street for a distance of 3,000 feet, the track to be laid with 114-pound girder rails on concrete foundations. E. E. Lytle, Portland, Ore., president.

Vallejo & Northern Railway, Vallejo, Cal.—T. T. C. Gregory of Suisun, Cal., has been elected president of this company, to succeed Melville Dozier, Jr., resigned. It is proposed to begin construction this spring on the line from Vallejo to Sacramento, Cal., 58 miles. (Noted November 23, 1907.)

Warren-Bisbee Railway, Bisbee, Ariz.—This company will soon begin the construction of an extension from Bisbee to the country club, 1½ miles.

West Chester & Wilmington Electric Railway, West Chester, Pa.—Surveys have been started on this proposed line from West Chester, Pa., to Wilmington, Del. At a recent meeting of the directors it was decided to increase the capital stock to $500,000. Thomas E. O'Connell, president. The Eastern Railway Construction Company, of which J. Frank Ball, Wilmington, is president, has been organized to build the line. (Noted April 4.)

Western New York & Pennsylvania Traction Company, Olean, N. Y.—M. Silverman, electrical engineer, writes that work on this company's 9-mile extension from Carrollton, N. Y., to Bradford, Pa., is progressing satisfactorily. The entire distance has been graded and the overhead work completed from Clarkdale to Limestown, four miles. Work is being pushed on the remaining 5-mile section from Limestown to Seneca Junction. The bracket type of overhead construction is used, with provision for high-tension transmission lines. Rotary converter substations will be located at East Bradford and at Seneca Junction. The line will serve the following towns: Clarkdale, State Line, Pa., and Limestown, Irwin's Mills, Riverside and Seneca Junction, N. Y. (Noted September 28, 1907.)

Winona Interurban Railway, Winona Lake, Ind.—We are advised by R. M. Murray, chief engineer, that grading on this company's proposed 43-mile extension has been completed from Peru to Akron, Ind., 22 miles, and that work is in progress on the 21-mile section from Akron to Warsaw. The overhead and track work has been finished from Peru to Chili, 10 miles, this section now being in operation, and work on the 12-mile section from Chili to Akron is being pushed. The bracket type of overhead construction is used. Power will be obtained from the company's power house at Winona Lake, Ind. Three substations of 300-kilowatt capacity each are under construction. The track is to be laid with 70-pound rails. Maximum curvature outside of towns, 3 degrees; maximum gradient, 2 per cent. All bridge work on the 22-mile section from Peru to Akron has been completed. S. C. Dickey, general manager, Winona Lake. (Noted April 4.)

York, Pa.—It is stated that plans are being perfected for the construction of an electric railway from York, Pa., to Turnpike, Pa., and subscriptions are being received. D. B. Goodling, Logansville; J. H. Keller, Shrewsbury; J. Myers, Glen Rock; J. N. Bailey, E. J. Beck, James Blouse, C. J. Smith, W. G. Allen and Benjamin Seitz, all of Pennsylvania, are interested.

POWER HOUSES AND SUBSTATIONS.

Guadalajara Railway Light & Power Company, Guadalajara, Mexico.—This company, which operates not only the entire lighting system, but also the railway system of Guadalajara, has recently placed a large order for additional electrical machinery with Messrs. G. & O. Braniff & Co. of Mexico City. The order includes a 750 kilowatt three-phase belted type Westinghouse generator. Three other generators will be installed as needed. The latter station was one of the first electric power plants in the country, the original installation consisting of single-phase machines, which were added to from time to time by other machines of the same type as growth necessitated.

New York New Haven & Hartford Railroad, New Haven, Conn.—We are officially advised that the reports that this company proposes to erect a large power house at Milford, Conn., are incorrect.

Norfolk & Portsmouth Traction Company, Norfolk, Va.—A year ago this company put into service a 10,500-kilowatt generating station. It is reported that it will now erect a substation for its Portsmouth division, to be fed with current from the new power station.

Pittsburg & Butler Street Railway, Pittsburg, Pa.—We are advised by Charles Gibson, Jr., vice-president, that this company is now installing a new Westinghouse 1,500-kilowatt single-phase turbo-generator in its power plant. With this installation there is also a complementary installation of Babcock & Wilcox boilers and an Alberger condenser. The increase in generating capacity is made in anticipation of a heavy traffic to and from the company's pleasure park at Butler, Pa.

Scranton Railway, Scranton, Pa.—It is reported that this company will erect a new power station for which plans are nearing completion. The Scranton Railway Company is controlled by the American Railways Company. A. S. Kibbe, chief engineer, Witherspoon building, Philadelphia, Pa.

Washington Water Power Company, Spokane, Wash.—It has been officially announced that $1,000,000 of the $3,000,000 recently realized by the sale of an issue of 5 per cent notes will be used in extending this company's power transmission lines and in increasing the capacity of its reserve steam station at Ross park, Spokane. This station now has a capacity of 4,000 horsepower, which will be increased to 16,000 horsepower. Its water power at Post Falls, Idaho, with a capacity of 12,000 horsepower, will be increased to 15,000 horsepower. The company operates two high-tension transmission lines from Spokane to the Coeur d'Alene mining district and another line south to Colfax, Palouse and Oaksdale.

Personal Mention

Mr. J. F. Scott, general superintendent of construction of the Chicago & Milwaukee Electric Railroad at Highwood, Ill., has resigned.

Mr. J. W. McDonald, Lincoln, Neb., has been elected to succeed Mr. M. L. Scudder as president of the Lincoln (Neb.) Traction Company.

Mr. J. M. Yount has resigned as master mechanic of the Lehigh Valley Transit Company, Allentown, Pa., to accept a similar position with the Union Railway Company of New York City.

Mr. J. B. Lukes, heretofore general superintendent of the Seattle (Wash.) Electric Company, has been appointed district superintendent of power for the Stone & Webster properties in that territory.

Mr. Charles Hallam Keep, who was appointed by Governor Hughes last June as a member of the public service commission of New York, second district, has resigned to become president of the Knickerbocker Trust Company of New York City.

Mr. H. C. Osborne of Toronto, Can., has been elected vice-president of the Chicago & Milwaukee Electric Railroad, Chicago, Ill., succeeding Mr. Gordon Ramsay, resigned. Mr. W. O. Kilman, heretofore treasurer of the company at Highwood, Ill., has resigned.

Mr. Walter H. Horton, superintendent of the Rutland (Vt.) Railway Light & Power Company, has resigned to become assistant superintendent of the Atlantic Gulf & Pacific Construction Company of New York City. Mr. Horton has been connected with the Rutland property since 1902.

Mr. Melville Dozier, Jr., of Oakland, Cal., has been appointed assistant general manager of the Northern Electric Railway at Chico, Cal. Mr. Dozier formerly was president of the Vallejo & Northern Railway Company, which is building an electric line from Sacramento to Vallejo, Cal.

Mr. J. M. Enright, assistant superintendent of the Toledo (O.) Railways & Light Company, has been appointed acting manager of railways, to succeed Mr. J. F. Collins, who has resigned as manager of railways to become general manager of the Saginaw-Bay City Railway & Light Company at Saginaw, Mich.

Mr. William Crilley, who has been acting superintendent of the Hartford-Rockville division of the Connecticut Company, with headquarters at Rockville, Conn., has been transferred to Hartford, the management of the Rockville line hereafter being under the direction of Division Superintendent Nettleton of Hartford.

Mr. T. M. Childs of Schenectady, N. Y., has been appointed master mechanic of the Washington Baltimore & Annapolis Electric Railway, Baltimore, Md., succeeding Mr. Henry Donovan, resigned. Mr. Childs has been connected with the motor department of the General Electric Company and during the construction of this line had charge of the installation of the single-phase motor equipment of the cars.

Mr. E. P. Wetmore has resigned as general manager of the Augusta (Ga.) Railway & Electric Company. Mr. Wetmore was appointed to this position about a year ago when the offices of general superintendent and general manager were combined. He is a native of Michigan and has been associated with many of the large street railway systems of the United States and Europe, including the electric railway properties of Liverpool, England.

Mr. J. F. Collins, manager of railways of the Toledo Railways & Light Company at Toledo, O., has resigned to become general manager of the Saginaw-Bay City Railway & Light Company, with headquarters at Bay City, Mich., succeeding Mr. S. E. Wolff, resigned. Mr. Collins has been connected with the Toledo traction lines since 1890, rising through successive promotions to the position of superintendent of railways and later manager of railways, having held the latter position since July of last year.

Mr. Howard F. Grant, for the past five years manager of the Seattle Electric Company at Seattle, Wash., has been appointed district manager of the Stone & Webster properties in the northwest; effective on March 31. He will be succeeded by Mr. E. E. Potter, heretofore assistant manager of the Seattle Electric Company. Mr. Potter formerly was general superintendent of the Union Street Railway at New Bedford, Mass., resigning that position last fall to go to Seattle as assistant manager under Mr. Grant.

Mr. L. H. Palmer has been appointed assistant to the general manager of the New York City Railway; effective on April 5, 1908. With the resignation of Mr. W. L. Derr, effective at once, the position of general superintendent will be abolished and the superintendent of transportation, superintendent of equipment, master mechanic in charge of shops and the head of the appointment department will report to the assistant general manager. The engineer of maintenance of way will report to the general manager.

Mr. William L. Derr, general superintendent of the New York City Railway, has resigned; effective on April 1. Mr. Derr entered railway service in 1876 and since that time has been connected with the engineering and operating departments of various steam railways throughout the country, including the New York & New England, New York Lake Erie & Western, Erie, New York New Haven & Hartford and the Chicago & Alton railroads. He resigned as superintendent of the latter road in July, 1907, to become general superintendent of the New York City Railway, where he has remained until the present time.

Mr. T. Garrett, superintendent of the Washington Arlington & Falls Church Railway, Ballston, Va., will, in addition to his present duties, take over those of manager and purchasing agent, which were formerly discharged by Mr. Fred B. Hubbell, vice-president of the company, until the appointment of Mr. Charles Hine as receiver last October.. Mr. Jacob Gerke, chief electrician and master mechanic, and Mr. C. A. S. Sinclair, civil engineer, have had their titles changed to assistant superintendent, with offices at Ballston, Va., where the general offices of the company are now located, the Washington office of the company having been discontinued.

Mr. W. G. Meloon, whose retirement as general manager of the Atlantic Shore Line Railway at Portsmouth, N. H., was announced in the Electric Railway Review for February 29, was presented on March 31 with a handsome gold watch, a gift from the employes of the railway of which Mr. Meloon had been general manager for 11 years. Mr. and Mrs. Meloon also were presented with a purse containing a considerable sum in gold, this being a gift from personal friends in Portsmouth and vicinity. As earlier announced, Mr. Meloon expects to leave shortly to take a position with one of the southern or western properties of A. H. Bickmore & Co., the owners of the road which he is leaving.

Mr. S. E. Wolff, vice-president and general manager of the Saginaw-Bay City Railway & Light Company at Saginaw, Mich., which controls the various street railway and lighting companies in Saginaw and Bay City, has resigned to accept a more responsible position with Hodenpyl, Walbridge & Co. of New York City, owners of these properties. Mr. Walbridge formerly was manager of the Jackson (Mich.) Gas Company, resigning in December, 1905, to become assistant general manager of the Saginaw-Bay City companies. Early in 1906 he was elected vice-president and general manager of the combined companies, where he since has remained. He will be succeeded by Mr. J. F. Collins of Toledo, O.

Mr. Arthur B. Smith, heretofore traffic manager of the Connecticut Company, New Haven, Conn., which controls the electric railways operated by the New York New Haven & Hartford Railroad, has been appointed general passenger agent of the New Haven company, with headquarters at Boston, Mass.; effective on April 1. He will have jurisdiction over the passenger service of all the lines of the company. Mr. Smith had 12 years' experience in the traffic department of the Chicago Burlington & Quincy Railroad at Omaha, Neb., and was for nine years employed in its engineering and maintenance of way department. In 1904 he was appointed assistant general passenger agent of the Northern Pacific Railroad at St. Paul, resigning in January, 1907, to become traffic manager of the Consolidated Railway Company, now the Connecticut Company, where he has remained until his present appointment.

OBITUARY.

Albert K. Hiscock, treasurer of the Auburn & Syracuse Electric Railroad, Rochester Syracuse & Eastern Railroad, Syracuse Lake Shore & Northern Railroad and the Syracuse & South Bay Electric Railroad, died at his home in Syracuse, N. Y., on April 7, 1908, after a short illness, aged 47 years. Mr. Hiscock graduated from Cornell University in 1882 and was admitted to the bar in 1884, but soon after became interested in commercial enterprises, in which he was actively engaged until a few weeks before his death. In addition to his position as treasurer of the Syracuse electric railway companies he was vice-president of the Trust & Deposit Company of Onondaga and managing director in the Auburn & Northern Electric Railroad, Oswego Traction Company, Monroe County Belt Line and the Skaneateles Lake Transportation Company. He also was a director in several construction companies engaged in building electric railways.

Financial News

Anderson (S. C.) Traction Company.—The International Trust Company of Baltimore, trustee under the deed to secure the first mortgage bonds, has petitioned the United States court at Charleston, S. C., for the appointment of a co-receiver.

Chicago & Milwaukee Electric Railroad.—The $1,000,000 of receivers' certificates, the issue of which has been authorized, will bear interest at 6 per cent per annum and will mature in three years. Judge Grosscup of the United States circuit court, Chicago, has authorized the directors of the Chicago & Milwaukee Electric Railroad of Illinois to pay the semi-annual interest on the bonds of the subsidiary Wisconsin company.

Chicago Railways Company.—The following statement for the year ended January 31, 1908, has been issued:

Income—		
Passenger	$10,367,551.57	
Chartered cars	4,228.50	
Mail cars	31,536.36	
Advertising	34,999.99	
Rent of land and buildings	3,305.00	
Rent of equipment	28,638.00	
Sale of power	28,419.80	
Interest on deposits (net)	27,886.58	
Miscellaneous	34,606.18	
Gross income from all sources		$10,560,571.98
Expenses—		
Maintenance way and structures	$ 647,699.82	
Maintenance equipment	835,803.19	
Transportation	4,228,762.05	
General	1,480,829.80	
Taxes	199,305.53	
Total expenses		7,392,400.39
Balance		$ 3,168,171.59
Deduction, interest at 5 per cent on valuation		1,566,158.96
Net income		$ 1,602,012.63
Divisible thus:		
Chicago Railways Company, 45 per cent	$720,905.68	
City of Chicago, 55 per cent	881,106.95	
		$ 1,602,012.63
Proportion due city of Chicago		$ 881,106.95
Less payments during year		17,757.20
Net payment		$ 863,349.75

Interborough Rapid Transit Company, New York.—At the hearing before the New York public service commission, first district, on April 7, regarding the proposed issue of $55,000,000 bonds E. F. J. Gaynor, auditor of the company, submitted the following estimate of earnings for 1908: Gross earnings, $24,959,728; operating expenses, $10,903,996; net earnings, $14,055,732; other income, $1,070,772; gross income, $15,126,504; interest and rentals, $5,296,832; taxes, $1,600,000; total interest, rentals and taxes, $6,896,832; balance, $8,229,672; 7 per cent dividends on Manhattan Railway stock, $4,200,000; net income, $4,029,672; 9 per cent dividends, $3,150,000; surplus, $879,672. T. P. Shonts, president Interborough-Metropolitan Company, said he believed that the maintenance charges of the Interborough Rapid Transit Company were high enough.

Metropolitan Street Railway, New York.—Kuhn, Loeb & Co. have announced that they would buy at their face value the coupons due on April 1 on the 4 per cent refunding bonds of this company, provided that the bonds are deposited with the protective committee, of which E. S. Marston is chairman, on or before May 15.

Mt. Vernon (O.) Railway & Light Company.—F. V. Owen was appointed receiver for this company on April 4 by Judge Charles W. Seward of Newark, O. The appointment was made on the application of P. B. Chase of Washington, D. C. The company expended $60,000 for improvements last year, the greater part of which is represented now by floating debt, as the company has been unable, on account of financial conditions, to dispose of bonds which had been authorized.

New York City Railway.—Judge Lacombe of the United States circuit court, New York, has granted the petition of the receivers of this company and the Metropolitan Street Railway for authority to issue $3,500,000 of 6 per cent 1-year receivers' certificates. The certificates will be superior in lien to the general and collateral trust and the refunding mortgage bonds. The receivers are to keep a separate account of the proceeds of these certificates and no part is to be used except in the improvement, acquisition, preservation or maintenance of property which is covered by both of the mortgages.

Norfolk & Portsmouth Traction Company, Norfolk, Va.—At the annual meeting of shareholders W. W. Moss was elected a director to take the place of E. L. Bemis.

Schenectady (N. Y.) Railway.—Gross earnings in the quarter ended December 31, 1907, were $246,272, as compared with $241,998 in the corresponding quarter of the previous year. Expenses were $167,054, as compared with $161,319. Net earnings were $79,218, as compared with $80,679. After crediting other income and providing for charges the final surplus was $56,436, as compared with $49,495.

Dividends Declared.

Brooklyn City Railroad, quarterly, 2½ per cent.

Capital Traction Company, Washington, D. C., quarterly, 1½ per cent.

Cincinnati Newport & Covington Light & Traction Company, Covington, Ky., common, quarterly, three-fourths of 1 per cent; preferred, quarterly, 1¾ per cent.

City Railway, Dayton, O., common, quarterly, 1¾ per cent; preferred, quarterly, 1½ per cent.

Columbus (O.) Railway & Light Company, one-half of 1 per cent.

Duluth-Superior Traction Company, Duluth, Minn., preferred, quarterly, 1 per cent.

Knoxville (Tenn.) Railway & Light Company, common, quarterly, 1 per cent; preferred, quarterly, 1½ per cent.

Louisville & Northern Railway & Lighting Company, New Albany, Ind., class A, quarterly, 1½ per cent; class B, quarterly, 1 per cent.

Manchester (N. H.) Traction Light & Power Company, quarterly, 2 per cent.

Memphis (Tenn.) Street Railway, preferred, quarterly, 1¼ per cent.

Omaha & Council Bluffs Street Railway, preferred, quarterly, 1¼ per cent.

Philadelphia Company, Pittsburg, common, quarterly, 1½ per cent.

Scioto Valley Traction Company, Columbus, O., preferred, quarterly, 1¼ per cent.

Syracuse (N. Y.) Rapid Transit Company, preferred, quarterly, 1½ per cent.

Toronto Railway, quarterly, 1½ per cent.

Tri-City Railway & Light Company, Davenport, Ia., preferred, quarterly, 1½ per cent.

Manufactures and Supplies

ROLLING STOCK.

Oklahoma Railway, Oklahoma City, Okla., is reported to be in the market for two cars.

Lehigh Valley Transit Company, Allentown, Pa., is in the market for four interurban cars.

Sandusky Norwalk & Mansfield Electric Railway, Norwalk, O., is in the market for two cars.

Rutland Railway Light & Power Company, Rutland, Vt., will place an order for a 44-foot express car body.

Mississippi Valley Interurban Railway, J. E. Melick, president, Springfield, Ill., has placed an order with the St. Louis Car Company for two double-truck interurban cars, 40 feet long over all. Delivery is to be made in May.

SHOPS AND BUILDINGS.

Connecticut Valley Street Railway, Greenfield, Mass.—The local car houses of this company were destroyed by fire on April 8. The loss is reported to be $25,000.

TRADE NOTES.

A. E. Mitchell, formerly manager of purchases and supplies of the New York New Haven & Hartford Railroad, has resigned to accept a position with the Wyckoff Pipe & Creosoting Company, Stamford, Conn.

William A. Kreidler, president of the Electrician Publishing Company, Chicago, died at Augusta, Ga., on March 26. Mr. Kreidler was the founder and principal owner of the Western Electrician, published by the company of which he was the head.

Charles N. Wood Company, 79 Milk street, Boston, Mass., announces that it has arranged with the estate of the late Louis Pfingst to continue the manufacture and sale of the Pfingst fenders, brake handles, car couplers and other electric railway specialties.

Iwan Brothers, Streator, Ill., report that the demand for Iwan post hole augers is greater this year than it ever has been before. In March the orders received exceeded those for March, 1907. Several good-sized orders for augers have recently been received from railways.

Ford, Bacon & Davis, New York, have been appointed consulting engineers to the receivers of the New York City Railway, with regard to certain improvements now being made in this property. The representative of Ford, Bacon & Davis, acting in the capacity of chief engineer, will make his headquarters at the offices of the railway company, 621 Broadway, and will report to the general manager for the receivers.

Frank MacGovern announces that he has associated himself with J. Warren Archer in the organization of a new firm, to be known as MacGovern, Archer & Co., with headquarters at 114 Liberty street, New York. Mr. MacGovern was formerly vice-president and general manager and Mr. Archer was manager of the sales department of Rossiter, MacGovern & Co. The new organization will handle electrical and steam machinery.

Atha Steel Casting Company, Newark, N. J., now has installed in its plant a complete equipment of machinery for making motor gears and pinions of manganese steel. The sales department is already placing these products on the market. The results of comparative experiments are said to substantiate the claim that a gear or pinion made of manganese steel will outlast, under equal service conditions, four or five gears or pinions manufactured from ordinary cast steel.

H. G. Perring, secretary of the Engineers' Club, Philadelphia, and formerly engineer with the Keystone Fireproofing Company, has become associated with the General Fireproofing Company, Youngstown, O., as engineer, with office in Philadelphia. Mr. Perring is widely known among railway engineers, having at different times been associated with the engineering departments of the Philadelphia & Reading, Choctaw Oklahoma & Gulf and the Philadelphia Rapid Transit Company.

Westinghouse Machine Company, through its president, George Westinghouse, has made formal announcement of the discharge of the company's receivers, which was reported in the Electric Railway Review for April 4. Mr. Westinghouse states that all matters have been satisfactory arranged, and that the company's position is greatly strengthened from every standpoint. Announcement is also made of the election of William H. Donner as vice-president of the company, in direct charge of all its activities.

James Graham, an electrical and mechanical engineer who has been identified with the electric trade in Europe, has become mechanical and electrical engineer of the Milloy Electric Company, Bucyrus, O., and has already entered upon his duties. Mr. Graham comes to the Milloy company with the highest recommendation of leading electric corporations of Europe. His early knowledge in mechanics was learned in the Fairchild shipbuilding yards, Glasgow, Scotland. After completing a course in mechanical and electrical engineering in Glasgow University, Mr. Graham was employed for some time with Scott & Mountain, electrical engineers, New Castle on Tyne. He next became superintendent of the winding and testing department of the General Electric Company of Manchester and London. Mr. Graham was next with George F. Milns & Co., electric car builders, at Hadley, Shropshire, England, as chief mechanical and electrical engineer. He was then made superintendent of the electrical manufacturing department of Armstrong & Whitworth, New Castle on Tyne, and upon severing this connection was made works manager of the car shops of the Glasgow municipal tramway system, where he also held the office of superintending erection engineer. He resigned this position to go with the Brush Electric Engineering Company, Loughboro and London, being the chief erecting engineer of the street railway car department. Under this engagement Mr. Graham installed street cars in over a hundred cities in Europe and gained an extensive knowledge, not only in the building but in the equipment and operation of street cars and street railway systems. During his experience in Europe Mr. Graham was engaged in every department connected with electric railways, studying both the manufacturing and the operating ends. He came to the United States the latter part of last year and has been engaged as superintendent of a large electrical manufacturing concern, resigning this position to become affiliated with the Milloy company.

ADVERTISING LITERATURE.

(Mention of the Electric Railway Review will assure prompt attention to requests for publications listed here.)

National Audit & Appraisal Company, Indianapolis, Ind.—Two leaflets outline the various services rendered electric railway companies.

R. Morrison Snyder, Consulting Architect and Structural Engineer, Ft. Wayne, Ind.—A post card giving the approximate weight per cubic foot of building materials.

Aberthaw Construction Company, 8 Beacon Street, Boston, Mass.—A 32-page circular illustrates and describes a large amount of important reinforced concrete construction handled by this company.

American Engineering Company, Indianapolis, Ind.—Among recent publications are attractive booklets entitled "Evolution of Transportation" and "The Promoter and the Financial Problem."

Chicago Mica Company, Valparaiso, Ind.—A series of blotters describes the good properties of "Micabond" in an interesting way. This company's mica and mica products have obtained eminent positions as electrical insulators in the electric railway field.

Garvin Machine Company, Spring and Varick Streets, New York.—Edition C of this company's catalogue, called the international edition, because it is printed in English, French and German, is descriptive of standard milling machines and is well illustrated and printed.

Universal Portland Cement Company, Commercial Bank Building, Chicago, Ill.—Bulletin No. 47 shows 11 halftone views of interesting concrete construction, in which Universal Portland cement was used. Included in the number is a view of a Vandalia Railway concrete viaduct.

Brown Hoisting Machinery Company, Cleveland, O.—"Ferroinclave" is the subject of an excellent catalogue of 36 pages and cover, just issued. Ferroinclave is a corrugated sheet steel of special shape used in reinforced concrete construction and its advantages are set forth by both lucid text and fine illustrations.

Inland Empire System, Spokane, Wash.—"Profitable Farming in the Spokane Country" is the title of a large folder containing much information of value to all interested in the subject. A number of excellent halftone illustrations afford evidence of profitable farming and a map shows the farming districts served by the company's electric lines.

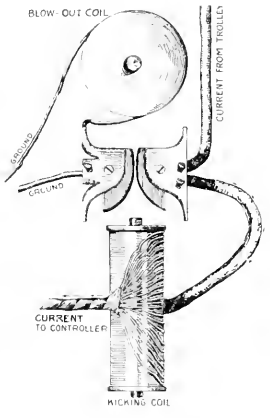
Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 1062 is devoted to an interesting description of the Milwaukee

Northern Railway. A number of illustrations are used, including several of the producer gas power plant, which is equipped with Allis-Chalmers 4-cycle double-acting twin-tandem gas engines, each of 2,000-horsepower capacity, driving Allis-Chalmers alternating-current generators.

Goldschmidt Thermit Company, 90 West Street, New York, N. Y.—"Reactions," the quarterly publication of this company, for the first quarter of 1908 is a booklet 8 by 11 inches, containing 22 pages of reading matter. The principal articles are on recent improvements in the thermit welding process and on important repairs made by the thermit process in 1907. Illustrations showing repairs made on engine crankshafts, water wheels, propeller shafts and propeller blades and locomotive frames are given.

THE CLARK LIGHTNING ARRESTER.

Very broad claims are made for a lightning arrester now being built by the Clark Manufacturing Company, Grand Rapids, Mich. A sketch of the essential parts of one of these arresters is reproduced herewith. The principles governing the operation of this arrester are simple. It has a low resistance, free discharge and a powerful magnetic blowout capable of caring for static discharges at high frequency. It is also said to require but little or practically no attention. As furnished for pole line or car use the arrester is inclosed in a wooden box 13¾ by 6¾ by 7 inches in size.



Sketch of the Clark Lightning Arrester.

The essential parts of the device as shown in the sketch comprise a spark gap, one side of which is connected to ground, a kicking coil and a magnetic blowout. The line current passes into the one-gap electrode and to follow its path to the apparatus it must next turn an acute angle. This abrupt change in direction assists materially in forcing the troublesome currents to jump the air gap to ground. Taking its current from the grounded side of the gap is a magnetic blowout coil, which serves to disrupt the arc in the spark gap whenever the dynamic current begins to maintain an arc.

A powerful kicking coil, in addition to the blowout coil and the spark gap, concludes the list of essential parts. This kicking coil is wound in multiple. It has a very high reactance which effectively retards the passage of lightning through the arrester by forcing the static discharge across the air gap to the grounded terminal. One feature in which the Clark arrester differs most from the average arrester is in the composition and arrangement of the electrodes or brushes, the brushes being all metallic, with the exception of the 14-inch carbon tips, with a $\frac{1}{16}$-inch air gap.

VACUUM APPARATUS FOR CAR CLEANING—OPERATED BY BRAKE RESERVOIR PRESSURE.

The use of vacuum apparatus for cleaning purposes is growing very rapidly. A number of railways find compressed and vacuum processes to be of especial value in renovating and regularly cleaning passenger cars. The National Vacuum Cleaning Company, Dayton, O., manufactures a special car cleaning outfit which is designed to operate with air pressure taken from the regular brake supply piping system of an electric car.

This vacuum car cleaner includes a dust-collecting tank, the interior being so arranged as to separate the dust from the air; an air jet vacuum producer mounted on top of the tank; special vacuum hose for conveying the dirt from the car to the vacuum tank, and the cleaning tools.

The vacuum producer is connected to the compressed air supply either to the pipe line or the air brake reservoir on the car by means of a compressed air hose. One end of the vacuum hose is connected to the side of the tank and the other end, to which the tools are attached, is taken into the car. The compressed air is turned on and regulated by the valve on the vacuum producer until the proper vacuum is obtained. The cleaning tools are passed over the seats and other articles to be cleaned until all the dirt is removed. The machine is not complicated and there is nothing to get out of order. It requires neither care nor attention other than that necessary to empty the tank daily of the accumulated dirt.

Probably the most important point to the railway man interested in car cleaning is that this vacuum cleaner not only removes all the dirt from the seats and cushions by suction, but carries it outside of the car and deposits it in a specially designed receiving tank, thus doing away with dust and dirt about the car house.

MERCHANDISE CREDITORS' PLAN FOR WESTINGHOUSE ADJUSTMENT.

The Westinghouse Electric & Manufacturing Company's "Merchandise Creditors'" committee has submitted a plan for readjustment of the debt and early restoration of the business to the company. The plan is substantially as follows: (a) Holders of the merchandise debt to take new fully paid assenting stock at par in settlement of claims. (b) Such of the bank debt as is not converted into "assenting stock" to be provided for, partly by convertible bonds of the existing authorized issue at par and partly by 5 per cent notes running at least five years or for an average period of at least five years. (c) Existing issues of convertible bonds, debenture certificates and collateral notes not to be disturbed. (d) The stockholders to subscribe at par for $6,000,000 of new "assenting stock" to increase the working capital. In recommending the acceptance of its plan the committee has issued a circular, of which an abstract follows: "At a recent conference of a number of the merchandise creditors, representing a majority in amount of the merchandise debt of the company, Joseph W. Marsh, vice-president the Standard Underground Cable Company, Pittsburg, Pa.; F. W. Roebling, president John A. Roebling Sons Company, Trenton, N. J.; Charles R. Remington, secretary the American Electrical Works, Phillipsdale, R. I.; A. Bournonville of Alfred F. Moore, Philadelphia, Pa.; and George M. Verity, president the American Rolling Mill Company, Middletown, O., were appointed to ascertain (in conference with the committee acting under the agreement dated January 20, 1908) whether some plan could be devised for the prompt termination of the receivership.

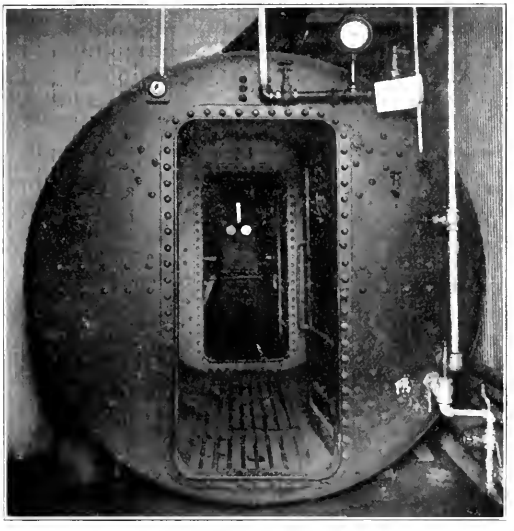
"If the plan which has been formulated by the 'Merchandise Creditors'' committee meets—as it is confidently expected it will—with the general approval of the creditors, the company will be practically freed from floating debt and provision will have been made for all cash requirements for a period of five years. The following are some of the reasons in support of the plan suggested by the committee: It prevents a mortgage bond issue. It prevents an unduly large issue of bonds of any kind. Under the mortgage bond plan we are convinced that the stockholders will be unwilling or unable to raise much new cash capital. The confidence in the future of the company which the merchandise creditors express by taking stock in full for their claims should certainly be an added incentive to the stockholders to make this plan effective. It enhances the company's credit, so that suppliers of material may feel free to extend the necessary current credit for future transactions, as they would not be disposed to do if there were a large mortgage bonded indebtedness and no material increase in cash capital. Because there is every reason to believe that the merchandise creditors' plan can be made effective in a much shorter time than any other, it being necessary to deal only with stockholders and the floating indebtedness; and because a speedy rehabilitation of the company is essential to the preservation of its good will and its working organization, which are costly and valuable assets. Because we believe that it is not only better for the creditors, but better for business interests generally, that this concern he put on its feet at the earliest possible moment. An immediate rehabilitation of the company will certainly have a very favorable effect on general business conditions, while continued delay or announcement of further trouble of any kind in the settlement of its affairs would have a very depressing effect upon conditions that are already sufficiently critical. A sale of the property would certainly have international adverse effect upon values of industrial securities. Because under normal conditions the country needs this company to be in strong active operation, not only as a large employer of skilled and unskilled labor, and as a large consumer of materials and supplies, but also as one of the large producers of apparatus that is absolutely essential in the development of the country."

The committee presents figures to show the smaller fixed charges under its plan than under the scheme for issuing mortgage bonds with a sinking fund provision and to show

that under its plan holders of claims aggregating but $12,275,042.68 would have to consent to the arrangement for rehabilitation, while under the other scheme owners of claims and securities amounting to $41,446,745.38 would have to consent. The quick assets with this plan operative are computed at $33,434,399.20, of which $6,000,000 would be the new cash from stockholders, $12,832,728.56 cash accounts and bills receivable and $14,601,670.64 working assets (inventory), the latter two items being computed as of February 29, 1908. The committee states that a careful estimate shows that under reasonably favorable conditions the company should, during the next five years, earn sufficient to pay all its fixed charges, 7 per cent per annum on the preferred stock, 6 per cent per annum on its entire issue of assenting stock (amounting to about $34,000,000 when this plan is effective), and create an annual surplus of at least $1,000,000. From figures submitted by the accountants, this estimate, the committee adds, would seem to be conservative. The company, through President George Westinghouse, signifies its approval of the plan. The "Readjustment" committee announces that the "Merchandise Creditors'" committee and representatives of the company have expressed confidence that by June 1, 1908, they will be able to furnish subscriptions at par to $10,000,000 of new assenting stock, payable, as to $4,000,000, in floating debt (chiefly merchandise claims), and as to $6,000,000 in cash, in instalments extending over a period of 10 months. The "Readjustment" committee deemed it wise to afford the merchandise creditors an opportunity to accomplish this result.

MEDICAL AIR LOCK.

On March 20 the workmen and staff of S. Pearson & Son, Inc., who have just completed the excavation of the East river tunnels for the Pennsylvania Railroad, presented to



Medical Air Lock.

E. W. Moir, vice-president of the company, an interesting model of a medical air lock bearing the inscription: "Presented to Mr. E. W. Moir, the maker of the first medical air lock on the Old Hudson Tunnel, 1890, by grateful 'Sand Hogs' on the Pennsylvania East River Tunnels, New York, 1908." The presentation was made in the yards of S. Pearson & Son in Long Island City, Henry Japp, local manager, tendering the salutation.

The model is made of brass, oxidized to look like steel, is mounted on a mahogany base and has a silver name plate. It was built by H. E. Boucher of New York to a scale of 1½ inches to the foot, measuring about 2 feet 6 inches long by 9 inches in diameter. It is complete in every respect, being lighted with electric lights and supplied with compressed air by an air pump. The hospital beds for the men to lie on and the compressing and decompressing valves along with thermometers and pressure gauges are shown in full detail.

The importance of the medical air lock in tunnel construction where compressed air is a factor is little understood. Workmen, especially those who have been working back of the shield in an atmosphere considerably compressed, upon leaving the tunnel are occasionally seized with a contraction of the muscles which is commonly termed "bends" and which if not treated properly and at once usually ends in death. In the building of the East river tunnels there have been at least three cases of men who to all intents and purposes were dead but after being recompressed in the medical air lock have fully recovered. Similarly there have been cases of paralysis which were thoroughly restored in the medical air lock. There are six medical locks installed in the East river tunnels for the use of engineers and workmen, these being all fitted with a double chamber so that the medical officer can pass in and out to his patient without interfering with the decompression.

Mr. Moir built the first air lock ever constructed in 1890, and this model is the work of appreciation and gratitude of the compressed air workers to the man who has done so much to relieve them of the dangers of their calling.

THE ROOKE AUTOMATIC REGISTER AND FARE COLLECTOR ADOPTED IN DES MOINES.

The Des Moines City Railway Company on Thursday of this week began using the Rooke automatic register and fare collector on its University avenue line. This register, which was described and illustrated in the Electric Railway Review of July 20, 1907, page 88, is manufactured by the Rooke Automatic Register Company of Providence, R. I., and has been in use for over a year on the lines of The Rhode Island Company in Providence and in other eastern cities.

The device is simple, consisting only of a compact registering apparatus which fits comfortably into the hand. The lower end of a chute running through from top to bottom rests in the palm of the hand. The passenger deposits his fare in the opening at the top. When the fare has entered the releasing mechanism is operated by the coin, and at the same time the entrance of the coin closes the passage. By the same action the lower end of the chute is opened to allow the coin to pass into the hand in which the register is held. During the same operation the fare is recorded and a bell is rung. When the coin has once entered the slot it cannot be removed but must pass through the chute to the conductor's hand, while the closing of the entrance to the coin passage or chute after the receipt of the coin prevents another coin entering until the mechanism is reset by the conductor. This act of resetting is done by the conductor pressing a trigger with his index finger, and this act puts the register in position for recording the succeeding fare.

The totalizing register is fastened directly to the mechanism, the figures showing through openings on the side of the case, which openings are covered by a heavy crystal. The mechanism is interlocked in such a way that the device cannot be used without turning the counters, and the connections are positive in action, not depending upon springs or ratchets. The totalizer numbers consecutively up to 100,000 and sets back automatically when that figure is reached. The totalizing counter is therefore never interfered with, the securing of the trip record being accomplished by merely recording the last number.

The chief advantage claimed for this register is that it insures a complete accounting for all fares collected, independent of the conductor, while providing perfect freedom in making collections, and that it guarantees the turning in of all fares while completely absolving the conductor from any suspicion of dishonesty.

One of the objects of the system is to encourage the use of nickels or metal fare tickets in paying fares, thus relieving the conductor to a large extent of the necessity for making change, although it is possible for him to do so without difficulty. The register is retained in the hand by means of a ring through which the conductor passes his middle finger, and when the use of both hands is required the register may be allowed to turn upon the finger and drop, in the same manner as the ordinary conductor's punch.

The Des Moines City Railway has adopted an aluminum fare check and in order to popularize their use it is planned to issue neat holders for these checks in a convenient form to slip in the pocket. Conductors will not be allowed to deposit fares for passengers, but, if required to furnish change, will hand the full amount to the passenger, who will himself deposit a nickel or a fare check. Transfers will not be registered.

Some of the most important advantages claimed for this system are as follows: The conductor is relieved of the inconvenience and physical effort involved in ringing up fares and the time thus consumed is saved. There is no possibility

of a mistake in registration. The opportunities for disputes with passengers in regard to the denomination of a coin offered are eliminated. A large saving of labor in the auditor's office will be effected, as a register will be assigned to a conductor for an entire day, to be turned in with his collections and trip reports, and the record of one register will not have to be checked up with the reports of various conductors.

The Des Moines City Railway has been conducting a campaign of education in the newspapers in order to familiarize the public and the conductors with the advantages of the new system.

The total weight of the register is only 21 ounces. When not in use it is suspended from a leather bracket carried upon the conductor's breast, thus allowing him free use of both hands.

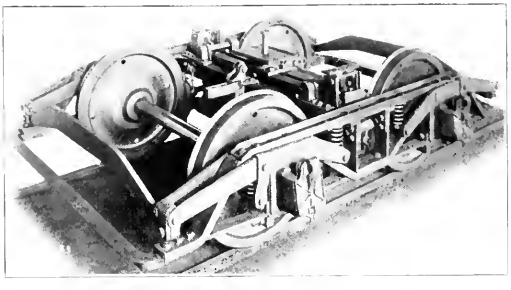
TRUCK WITH NEW MOTOR SUSPENSION.

A new method of motor suspension has recently been patented by B. R. Van Kirk, mechanical engineer of the truck department of the Baldwin Locomotive Works. In the new type of truck the motor weight upon the suspension is fulcrumed over the driving box and applied to the frame in an upward direction at a point near the center of the truck. This relieves the end frame of the motor weight and decreases the tilting effect of the motor reactions. Heretofore outside hung motors have been suspended from the truck frame in such a way that their weights and torque reactions were applied with a large leverage, thus bringing severe bending moments on the truck frames and requiring heavy structures. The intermittent nature of the motor torque reactions disturb the equilibrium of the frame and produce a tilting or rocking effect.

The objects of the new style of suspension are: (1) To entirely relieve the overhanging ends of truck frame from the weights and shocks of motor support. The weight by fulcruming over the journal box as shown in the illustrations is actually transformed into a supporting reaction near center of frame. (2) To transfer the motor torque reactions to points relatively near the center of the frame, thus reducing their tendency to produce a rocking effect and consequent fluctuation in weight and available adhesion.

Trucks of this design, with inside hung brakes, are now in successful operation on the lines of the Orange County Traction Company, Newburgh, N. Y.

As the new truck is constructed of commercial sizes of iron and steel, with castings almost entirely eliminated, the



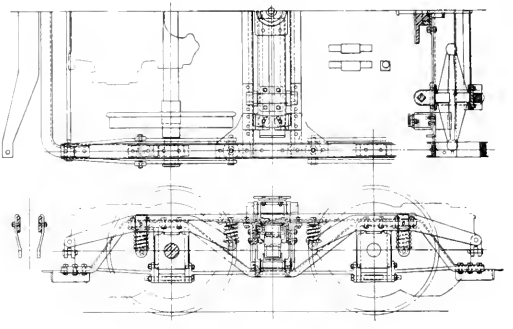
New Baldwin Truck—Showing New Method of Suspension for Outside Hung Motors.

weight is reduced to approximately 2,600 pounds, exclusive of wheels, axles and boxes, for center pin loads up to 18,000 pounds. Simplicity of detail and of construction make it an easy matter to replace parts injured by accident or wear, and this can be done in any shop of ordinary facilities.

One of the leading features of the new light truck is the method of motor suspension. The manner in which the suspension beams fulcrum on the driving boxes is clearly shown in an illustration. The motor weight and reaction together with the center pin load are applied to the truck frame at the same point. In this arrangement each motor is supported independently, thus decreasing the tilting movement of the frame. As the weight of the motors comes directly over the driving boxes the adhesion of the wheels is increased.

On trucks where the motors are supported on the end frames it is necessary to make the carrying springs of sufficient stiffness to carry the weight of the motors in addition to the center pin loads and weight of truck frame. The new suspension relieves the springs of the motor weight and permits them to be made so sensitive as to result in an easy riding truck.

In short wheel base trucks the space available for bolster and transom is so limited that a narrow bolster is necessary. To permit the use of inside hung brakes many builders find it necessary to locate the bolster springs at the extreme ends of the bolster, parallel to and under the side frames. When so placed the space is so limited as to necessitate the use of a short half elliptic spring. With the Baldwin construction not only a swing bolster of ample width, but a full elliptic

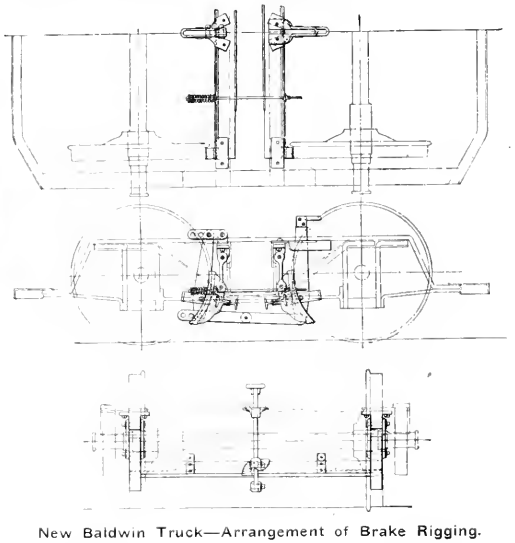


New Baldwin Truck—Method of Suspension.

spring, can be provided at each end of the bolster and not interfere with the inside hung brakes. The spring seated on the inside and at the top of the bolster makes a very compact and stable construction.

To keep the car at the same height and offset the wear of tires and jonrnal brasses, a novel adjustment is provided at the lower end of the swing link. This adjustment is simply an eccentric pin placed in a guide as shown in the illustration.

Special care has been given to the design of brake work,



New Baldwin Truck—Arrangement of Brake Rigging.

which, as illustrated, is simple, strong and light. Ample clearance is provided, while all parts are easily accessible, thus simplifying inspection and the replacing of brakeshoes. A removable brakeshoe is provided which fits into a standard M. C. B. head. Provision is made for readily adjusting brake work to take up the wear of shoes and tires. Journal boxes are of standard M. C. B. design, with ample space for lubrication. Journal centers are also M. C. B. standard. On account of its strength, lightness and durability and the use of M. C. B. standards for all wearing parts, this truck should prove popular for city and suburban service.

Wanted—A young man experienced in street railway and electric light accounting desires position as auditor. Best of references as to character and ability. Address "No. 573," care of Electric Railway Review, Chicago.

Management of street railway amusement park wanted; experienced, up-to-date, sober and reliable. Park playing vaudeville and bands preferred. Experienced in park designing and construction. Best of references. Don't put it off, write me today. Address E. E. Wilmarth, Massillon, Ia.

Wanted—To correspond with company needing the services of high-class general manager or general superintendent. Electrical and civil engineer; 17 years' experience with large properties and in construction and operation. Address "No. 568," care of Electric Railway Review, Chicago.

Experienced electrical engineer wants position with manufacturing concern or with company operating electric railways. Graduate Purdue University, 1905. Will go anywhere for permanent position. Age 26; married. A No. 1 references as to habits and ability. Address "No. 570," care of Electric Railway Review, Chicago.

Position wanted as auditor and accountant. Sixteen years of steam, electric and general experience; good working knowledge of details of general contracting business; clever buyer; possess ability to organize. Can furnish first-class reference as to character and ability and work accomplished in past; leaving present work because closed; at liberty to accept position any time. Address "No. 575," care of Electric Railway Review, Chicago.

POSITIONS OPEN.

Twelve offices, covering the entire street railway and manufacturing world. Positions open everywhere; office, sales and technical. Write today, HAPGOODS, 305 Broadway, New York, or 1010 Hartford Bldg., Chicago.

Best general manager obtainable to construct and operate a new interurban system. Initial line only the beginning of a system. Give experience and reference. Address "No. 579," care of Electric Railway Review, Chicago.

BUSINESS OPPORTUNITIES.

Wanted—Man with some capital and a knowledge of railway track supplies to join the advertiser—a salesman handling locomotive and car supplies—in a general railway supply business. Address "No. 558," care of Electric Railway Review, Chicago.

Recharging Dry Batteries, the only book ever published giving complete directions of how to prepare chemicals for renewing dry batteries. If you are not more than pleased with this book your dime back. Large electrical catalogue and book postpaid, 10 cents. Adams Electric Co., Dept. E. R., Kewanee, Ill.

MISCELLANEOUS WANTS.

Want to buy second-hand equipment, machinery or material? A card inserted in the Electric Railway Review, stating just what you want, will bring immediate response. The cost is small—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Send orders to Electric Railway Review, 160 Harrison St., Chicago.

MISCELLANEOUS WANTS.

What have you to sell in the way of second-hand equipment, machinery or material? Buyers read the "For Sale" cards on the following page and there is the place to tell your story. "For Sale" cards are inexpensive—only $1.20 an inch (measuring 1 inch deep by 1⅝ inches wide) per insertion. Special rates on contracts for 100 inches or more to be used within one year. Now is the time to send your order to Electric Railway Review, 160 Harrison St., Chicago.

BOOKS AND PUBLICATIONS.

Wanted—Copies of the Street Railway Review of July 20, 1904, and June, 1906. State condition and price. Address "No. 567," care of Electric Railway Review, Chicago.

Wanted—Copies of the Street Railway Review of April, 1900, May, 1901, and August, 1903. State price and condition. Address "No. 553," care of Electric Railway Review, Chicago.

Interstate commerce national legislation to July 1, 1906, is fully covered in our reference pamphlet. It contains the full text of the act to regulate commerce as amended, including the Elkins and Hepburn acts, and of the supplementary act relating to the testimony of witnesses before the interstate commerce commission. It also contains the texts of the expedition act, the anti-trust act of 1890, the employers' liability act and the safety equipment laws. Difference in type shows the parts expunged from, and the parts added to, the interstate commerce and Elkins acts by the Hepburn act. This pamphlet is of special value to railway men and lawyers. Mailed prepaid for 25 cents in stamps or coin. Special prices for quantities. The Wilson Company, 160 Harrison St., Chicago.

Classifications of Electrical Corporations.

The tentative classifications of accounts suggested for electrical and gas corporations by the New York public service commission, second district, provide for a much wiser grading of companies with regard to the magnitude and financial importance of their operations than the interstate commerce commission tentative classifications for electric railways. The public service commission has tentatively fixed four grades of corporations as follows, and corresponding classifications: Companies with annual gross revenue of less than $10,000; of $10,000 and below $100,000; of $100,000 and below $1,000,000; of $1,000,000 or over. The interstate classifications suggest but two classes, and this feature of its proposed system has been subject to more nearly unanimous criticism than any other. If gross annual revenue is to be adopted as the basis for classifying electric railway companies, a much more liberal division should be made than has been indicated in Circular No. 20 of the interstate commission. C. N. Duffy suggests (Electric Railway Review, April 4, 1908, page 419) that three classifications be provided for electric railways instead of two. All evidence which has been submitted tends to show that economic waste would result if small companies were required to attempt to keep amplified classifications which would be used ordinarily by large companies only.

Prospects for New Subways in New York.
